Griffin, Gilderoy Wells, author, born in Louisville, Ky., March 6, 1840; died there, Oct. 21, 1891. He was educated at the University of Louisville, was admitted to the bar in 1861, and after practicing for some years engaged in journalism. In 1871 he was appointed United States consul at Copenhagen; in 1876 at the Samoan Islands; in 1879 at Auckland, New Zealand; and in 1884 at Sydney, Australia. He held the latter office at the time of his death, which occurred while he was on leave of absence. He published a biographical sketch of George D. Prentice (1869); an edition of "Prenticeana" (Philadelphia, 1871); "Studies in Literature" (1871); Life of Charles S. Todd" (1873); "Danish Days" (1874); "A Visit to Stratford" (1875); and "New Zealand, her Commerce and Resources" (Wellington, New Zealand, 1884).

Griffin, Julia Averil, nurse, born in Hudson, N. Y., April 30, 1832; died in Niagara Falls, N. Y., Dec. 17, 1891. She volunteered for service at the front on the first call for nurses in the civil war, and labored with much devotedness till captured at the battle of Manchester. After being paroled, she retired to Niagara Falls, but in 1864 she again went to the front and served till prostrated with asthma. She was elected an honorary member of the Soldiers' and Sailors' Memorial Association in 1876, and was granted a pension by special act of Congress in 1888. For many years the Grand Army posts dipped their flags in salute to her while on their Decoration Day parades.

Grinnell, Josiah Bushnell, capitalist, born in New Haven, Vt., Dec. 22, 1821; died in Marshalltown, Iowa, March 31, 1891. He took a preparatory course in Middlebury College, was graduated at Auburn Theological Seminary in 1847, was ordained a Presbyterian clergyman, and held pastorates in Union Village, N. Y., Washington, D. C., and in a Congregational church in New York. After a brief experience as a clergyman he removed to Iowa, where he engaged in general farming, and became the largest wool-grower in the State. In 1854 he purchased 6,000 acres, laid out the town of Grinnell, and deeded the site to trustees for the founding of an educational institution. This became Grinnell University, and a few years ago was consolidated with Iowa College. In 1856 he supported the presidential canvass of John C. Frémont, after having written the State address at the organization of the Republican

party in Iowa, and was elected to the State Senate on his personal platform of "free schools, no slavery, and limitation to whisky." He served four years in the Senate, was a delegate to the Republican National Convention that nominated Abraham Lincoln in 1860, and was appointed a special agent of the United States Post-office for the Northwest in 1861. In 1862 and 1864 he was elected to Congress as a Republican, and he served on the committees on Post-offices and Post-roads, on Freedmen, on Agriculture, and on Postal Railroad to New York. Subsequently he was appointed referee in the disputed title of 800,000 acres of land in Cherokee and Crawford Counties, Kan. He supported Horace Greeley for President in 1872, and was appointed Commissioner of the United States Bureau of Animal Industries in 1884. He was an influential member of the American Agricultural Association, President of the St. Louis and St. Paul Railroad, which, on completion, became a part of the Iowa Central system, President of the State Horticultural Society, President of the First National Bank of Marshalltown, and an extensive breeder of various kinds of live stock. He published many pamphlets on agricultural, industrial, and kindred topics, including "Home of the Badgers" (1845), and "The Cattle Industries of the United States" (1884).

Gundry, Richard, physician, born in Hampstead, near London, England, in 1829; died in Baltimore, Md., April 23, 1891. He received a private-school education; removed with his parents to Simcoe, Ontario, Canada, in 1845, and began studying medicine there; was graduated in medicine at Harvard in 1851, and settled in Rochester, N. Y., to practice. He remained there three years, then removed to Columbus, Ohio, and was appointed assistant physician in the Ohio State Lunatic Asylum in 1855, at the same time taking the chair of Materia Medica and Mental Diseases in the Starling Medical College. In 1858 he was transferred to the Southern Ohio Insane Asylum, at Dayton, as assistant physician; in 1861 was appointed superintendent; and in 1872 was placed in charge of the completion and organization of the State Asylum, at Athens. He was elected Professor of Materia Medica and Mental Diseases in the College of Physicians and Surgeons, in Baltimore, in 1882, and also was appointed Superintendent of the Maryland Hospital for the Insane, at Spring Grove, holding both offices till his death. Dr. Gundry was a conspicuous advocate of the system of non-restraint in the management of the insane. He was President of the Harvard Association and a manager of the State Home for the Feeble-minded; and was author, among many other publications, of "Puerperal Insanity," "Non-restraint in the Care of the Insane," and "Some Problems of Mental Action."

Baight, Charles, lawyer, born in Colt's Neck, N. J., Jan. 4, 1838; died in Freehold, N. J., Aug. 1, 1891. He was graduated at Princeton in 1857; studied law, was admitted to the bar, and became law partner of Joel Parker. He was appointed brigadier-general of militia in 1861. In 1861-'62 he was a member of the Legislature, and in his second term Speaker of the House. Throughout the civil war he rendered the national cause important service in raising, equipping, and dispatching State troops to the seat of war. In 1867 and 1869 he was elected to Congress as a Democrat from the 2d New Jersey district, and since 1879 he had been prosecutor for Monmouth County.

Haines, Alanson Austin, clergyman, born in Hamburg, N. J., March 18, 1830; died there Dec. 11, 1891. He was a son of Daniel Haines, ex-Governor and ex-Supreme Court judge of New Jersey; was graduated at Princeton in 1857, and at the Theological Seminary in 1858; and held pastorates in Berlin, Md., and Amagansett, L. I., till 1862. He was then appointed chaplain of the 15th New Jersey Volunteers, with which he served till the close of the war, and participated in 3" battles. His life was in peril many times, and he frequently went into the thickest of a fight to care for the wounded and dying, when experienced officers hesitated to detail men for that

duty. He was collected and fearless in battle, a favorite among officers, and beloved by his men. After the war he was called to the pastorate of the Presbyterian church in Hamburg, which he held till July, 1890, when failing health forced him to resign. Chaplain Haines, who in early life had studied and practiced civil engineering, served as engineer of the United States Palestine Exploration Society in 1873 and 1876, and, visiting the Holy Land, Egypt, and Turkey, made numerous maps, sketches, and transcripts of rock inscriptions. He published "Explorations in Moab and Sinai" and "History of the Fifteenth Regiment of New Jersey Volunteers" (New York, 1833). He was a member of the New Jersey Historical Society and of the Grand Army of the Republic, and posts of veterans for miles around followed his remains to the grave.

Hall, Benjamin Franklin, jurist, born in Whitehall, N. Y., July 23, 1814; died in Auburn, N. Y., Sept. 6, 1891. He began the study of law in Whitehall, and continued it in the office of William H. Seward in Auburn, whither he removed in 1835, and was admitted to the bar in 1837. From December, 1850, till February, 1852, he was employed in Washington in revising and compiling the official opinions of attorney-generals of the United States, and in 1852 was elected Mayor of Auburn. In April, 1861, on the recommendation of Secretary Seward, President Lincoln appointed Mr. Hall chief justice of the newly created Territory of Colorado, and during his three years' tenure of the office he did much to establish the present judicial system of the State. He was appointed chief of the Bureau of Commercial Statistics in the State Department at Washington in 1867, and after he retired from that office failing health forced him to seek private life. Judge Hall was an enthusiastic student of history and a writer of much clearness and power. His publications include "The Republican Party and its Candidates" (1856); an earlier law digest for the use of Western settlers entitled "The Land-owner's Manual"; and many political and historical pamphlets.

Hamilton, Charles Smith, military officer, born in Western, Oneida County, N. Y., Nov. 16, 1822; died in Milwaukee, Wis., April 17, 1891. He was graduated at the United States Military Academy and appointed 2d lieutenant in the Second United States Infantry in 1843; served through the Mexican War, taking part in the battles of Monterey, Contreras, Churubusco, and Molino del Rey; was brevetted captain for gallantry in the war; and after a period of frontier duty, he resigned from the army in 1853 and engaged in farming and in manufacturing flour in Fond du Lac, Wis. On May 11, 1861, he was appointed colonel of the Third Wisconsin Volunteers, and on May 17 he was promoted brigadier-general. He took part in the siege of Yorktown and the chief military operations in Virginia in 1862, and was promoted major-general of volunteers on Sept. 19 of that year. Transferred to the Army of the Mississippi, he commanded a division at Corinth and Iuka, and from October, 1862, till January, 1863, commanded the left wing of the Army of the Tennessee in Gen. Grant's flank movement to Oxford, Miss. On April 13, 1863, he resigned his commission, and resumed manufacturing in Fond du Lac, subsequently settling in Milwaukee. In 1863 he became a regent, and in 1866 President of the Board of Regents of the Wisconsin State University, and from 1869 till 1877 he was United States marshal for Wisconsin.

Hamlin, Hannibal, statesman, born in Paris, Me., Aug. 27, 1809; died in Bangor, Me., July 4, 1891. His paternal grandfather was an officer in the Continental army. He received his early education in the district school, and was prepared for college in Hebron Academy. Circumstances compelling him to give up his proposed college course, he began teaching, and with the money so acquired purchased books and undertook the study of law. The death of his father obliged him again to abandon study in order to take charge of the home farm. Two years after the death

of his father he, in association with Horace King, purchased a weekly paper, "The Jeffersonian," but soon afterward he sold his interest to his partner and resumed law study. In 1833 he was admitted to the bar, and about the same time began to be active in politics as a Democrat. He was a member of the Legislature in 1836-'40 and in 1847, and Speaker in 1837, 1839, and 1840. He was elected to Congress in 1842 and 1844. In 1848 he was elected United States Senator to fill a vacancy caused by the death of Senator Fairchild, and in 1851 was re-elected for a full term. In 1856 his strong antislavery convictions led him to sever his connection with the Democratic party and become a Republican, and in the same year he was elected Governor of Maine, resigning his seat in the United States Senate in 1857.

Within a fortnight he was again elected Senator, and resigned the office of Governor. In 1860 he was elected Vice-President of the United States on the ticket with Abraham Lincoln, and, resigning his seat in the Senate, he presided over that body from March 4, 1861, till March 3, 1865. In 1864 his name was proposed for renomination, but, as it was deemed politic to place on the ticket the name of a man representing the loyal element of the Southern States, the nomination was given to Andrew Johnson. After Mr. Hamlin's death the question of his availability and of President Lincoln's preference for the second place on the ticket was the subject of much newspaper discussion. In 1865 President Johnson appointed him Collector of the Port of Boston, where he remained a year. In 1868 and 1875 he was re-elected United States Senator, and in 1881-'83 he was United States minister to Spain, resigning in the latter year to retire to private life after a public service of nearly fifty years. He was a regent of the Smithsonian Institution in 1861-'65 and 1870-'82, and for twelve years he was dean of the board. He had also been a trustee of Colby University (formerly Waterville College) for twenty years.

Hancock, John, educator, born in Ohio, Feb. 19, 1825; died in Columbus, Ohio, June 1, 1891. He received a common-school education, and supplemented it with continuous private study; taught for several terms in country schools; became first assistant in a district school in Cincinnati in 1852, and subsequently principal; and in 1867 was elected superintendent of the public schools of that city. He held this office several years, resigning to become superintendent of schools in Dayton, and after serving there ten years he accepted a similar office in Chillicothe. While in Chillicothe he was appointed by Gov. Foraker State School Commissioner of Ohio, which office he held until his sudden death. He had been a member of the Ohio Teachers' Association since 1852, and its president since 1860; a member of the National Educational Association since 1858, its treasurer in 1872-'74, and president in 1879; and a member of the National Council of the National Association since its establishment in 1881.

Hand, Daniel, philanthropist, born in Madison, Conn., in 1801; died in Guilford, Conn., Dec. 17, 1891. He received a district-school education, and in 1818 went to Augusta, Ga., with his uncle, Daniel Meigs, a merchant doing a large business in that city and in Savannah. He began his business career as a clerk in his uncle's store, and in time succeeded to the business. About 1846 it had grown so large that he took a tried clerk, George W. Williams, into partnership, and established a branch house in Charleston under the management of Mr. Williams. At the beginning of the civil war Mr. Hand, temporarily in New Orleans, was arrested by the Confederates as a spy and placed

under parole. Soon afterward he was nearly mobbed in Augusta, while in Charleston the sequestration of his property was averted only by the influence of his partner. Mr. Hand lived in Asheville, N. C., under parole during the war, and after its close removed to Guilford, Conn., never questioning his partner's integrity. About 1880 Mr. Williams visited Mr. Hand, rendered a full statement of the business since the beginning of the war, and gave him securities for \$558,000, Mr. Hand's share of the profits. In October, 1888, Mr. Hand, who had carefully invested the money, gave to the American Missionary Association the principal and its earnings, \$1,000,894, for a fund for educating Southern negroes. To this sum, the largest up to that time ever given to benevolence by a living American, Mr. Hand added by bequest \$300,000 for immediate use and \$200,000 in reversion after the death of family legatees.

Hanna, Bayless W., lawyer, born in Troy, Ohio, March 14, 1830; died in Crawfordsville, Ind., Aug. 2, 1891. When six years old he removed with his parents to Crawfordsville, where he was graduated at Wabash College. He studied law with Joseph E. McDonald and Josiah Winchester; was admitted to the bar in Natchez, Miss., in 1855; returned to Crawfordsville to practice, and was elected prosecuting attorney of the county in 1858. In the following year he removed to Terre Haute. He was elected to the Legislature as a Democrat in 1862, to the Senate in 1864, and to the office of Attorney-General of the State in 1870; and in 1872, 1876, 1880, and 1884 he was delegate-at-large from his State to the National Democratic Conventions. In the convention of 1876 he was chairman of the Committee on Permanent Organization. He was presidential elector-at-large in 1872 and 1884, and after President Cleveland's inauguration he was appointed United States minister to the Argentine Republic.

Hardeman, Thomas, commission merchant, born in Eatonton, Ga., Jan. 12, 1825; died in Macon, Ga., March 6, 1891. He was a son of Thomas Hardeman, one of the pioneers of Georgia; was taken to Macon while an infant; was graduated at Emory College in 1845, and admitted to the bar in 1846, but engaged in the commission business in preference to the practice of law. In 1853, 1855, and 1857 he served in the Legislature as an old-time Whig. On the breaking up of that party he joined the Union party. In 1859 he was elected to Congress, where he was also a member of the Committee on Mileage, and served till the secession of his State. He then entered the Confederate army, and became captain of the Floyd Rifles, major of the Second Georgia Battalion, colonel of the Forty-fifth Georgia Regiment, and adjutant-general on the staff of Gen. Gustavus W. Smith, and was severely wounded at Cold Harbor. In 1863, 1864, and 1874 he was a member and Speaker of the State House of Representatives; in 1872 was a delegate to the Liberal Republican Convention; served four years as President of the State Democratic Convention and as chairman of the State Executive Committee; and in 1883-'85 was Representative-at-large in Congress and member of the Committees on Territories and on Expenditures in the State Department.

Hart, Tony, see CANNON, ANTHONY.

Hasselquist, Tuve Nilsson, educator, born in Hasslarad, Sweden, March 2, 1816; died in Rock Island, Ill., Feb. 4, 1891. He was graduated at the University of Lund, Sweden, and ordained in the Lutheran Church in 1839. After serving for several years as assistant pastor in various parishes in his native country, he became pastor of a Swedish Lutheran congregation in Galesburg, Ill., in 1852. In 1855, while engaged in his pastoral duties, he established a religio-political journal, from which have been developed "Hemlandet," a political weekly published in Chicago, and "Augustana," a religious weekly, published in Rock Island, Ill. Of the latter journal he continued editor-in-chief to the time of his death. He was present at the organization of the Evangelical Lutheran Augustana Synod in 1860, and was its first

president, to which office he was annually re-elected until 1870. In 1863 he was elected President of Augustana Theological Seminary, which has since become Augustana College and Theological Seminary. He continued to serve as president of this institution up to the time of his death. His chief literary work is a commentary on Ephesians.

Hatfield, Robert M., clergyman, born in New York in 1818; died in Evanston, Ill., April 1, 1891. He received a common-school education, prepared for the ministry at an early age, and was admitted to the Providence Conference of the Methodist Episcopal Church in 1841. He held appointments in New York city, Brooklyn, Baltimore, Chicago, and Philadelphia; was transferred to the Rock Island Conference in 1877; was a delegate to the General Conferences of 1864, 1876, 1880, and 1884; and in 1889 became financial agent of the Northwestern University and Science Hall at Evanston.

Havemeyer, Frederick Christian, manufacturer, born in New York city, Feb. 5, 1807; died in Throggs Neck, Westchester County, N. Y., July 28, 1891. He was a son of Frederick C. Havemeyer, who, with his brother, William F. Havemeyer, came to the United States from Bückeburg, Schaumburg-Lippe, Germany, in 1802, and established a sugar refinery in Vandam Street, New York city. Frederick Christian, Jr., was educated at Columbia College, but left before graduation to form with his cousin the firm of W. F. & F. C. Havemeyer, as successors to their fathers' business. The cousins conducted it with large success till 1842, when both retired and were succeeded by their brothers, Albert and Diedrich. Frederick's father died in 1841, leaving a large estate, and Frederick himself had accumulated considerable property. The care of the two estates occupied his attention till 1855, when he re-entered the sugar firm, with which, under its various corporate names, he remained until his death. He was one of the original trustees of the New York Public School Society, for many years an active member of the old volunteer fire department, and a founder of the Century Club.

Heerst, George, capitalist, born in Franklin County, Mo., Sept. 3, 1820; died in Washington, D. C., Feb. 28, 1891. He received a public-school education; was brought up on his father's farm; went to California in 1850, and began working in the mines; subsequently engaged in buying, selling, and trading claims; and in 1859, when almost penniless, joined the throng of miners who made the memorable rush to the Washoe region, of which Virginia City is now the center. He there watched his opportunities for trading claims, made and lost considerable money, and was one of the few men who, striking a rich lead, followed it closely, and became very wealthy. Subsequently he entered a firm of mining operators, in San Francisco, which secured control of large and valuable properties in California, Utah, Dakota, Montana, and Colorado; and he became widely known as a successful locator and developer of gold and silver mines. Within a few years he was the owner of mines and mills that gave employment to 2,000 men, and his quartz mills crushed 1,000 tons of ore daily. He also engaged largely in stock-raising and in general farming with similar success. In 1865 he was elected to the State Legislature; in 1866 he was appointed United States Senator to fill a vacancy, and in the same year he was elected for the full term, beginning March 4, 1867. In the Senate he was a member of the standing committees on Indian Affairs, on Mines and Mining, and on Revolutionary Claims, and of the select committees to inquire into all claims of citizens of the United States against the Government of Nicaragua, and on the President's message transmitting the report of the Pacific Railway Commission. He was the owner of several noted race-horses. His fortune was estimated at \$20,000,000.

Hereford, Frank, lawyer, born in Fauquier County, Va., July 4, 1825; died in Union, Monroe County, W. Va., Dec. 23, 1891. He received a collegiate edu-

cation; studied and practiced law; removed to California, and was district-attorney of Sacramento County from October, 1855, till October, 1857; and, settling in Union, W. Va., was elected to Congress from the 3d West Virginia District, as a Democrat, in 1870, 1872, and 1874, and was elected United States Senator to fill the vacancy caused by the death of Allen T. Caperton, in 1876. In the House he was chairman of the Committee on Claims and a member of that on Militia, and in the Senate he was chairman of the Committee on Mines and Mining and a member of that on Claims.

Herndon, William Henry, lawyer, born in Greensburg, Ky., Dec. 28, 1818; died near Springfield, Ill., March 18, 1891. In 1820 his parents removed to Illinois, where he was educated and admitted to the bar. On Sept. 20, 1843, he formed a law partnership with Abraham Lincoln, which continued in fact till Mr. Lincoln's election to the presidency, and in form till his death, for when the President-elect was about leaving Springfield to be inaugurated he entreated his partner to let his name remain on the office sign till he returned from Washington. So strong was the personal friendship and confidence of the two men that to the day of the assassination Mr. Herndon transacted all the business of the firm in the name of Lincoln & Herndon. After Mr. Lincoln's death, Mr. Herndon gradually withdrew from law practice and public life. He published a "Life of Abraham Lincoln," a revised and enlarged edition of which with an introduction by Horace White is in press.

Hilgard, Julius Erasmus, physicist, born in Zweibrücken, Bavaria, Jan. 7, 1825; died in Washington, D. C., May 8, 1891. He was the eldest son of Theodore E. Hilgard, an eminent German jurist and writer, and came to the United States with his father in 1835,

settling in St. Clair County, Ill. His education was obtained direct from his father until he was eighteen, when he removed to Philadelphia in order to follow special studies in civil engineering. While so engaged he attracted the notice of Alexander D. Bache, who in 1845 became Superintendent of the United States Coast Survey, and at once invited young Hilgard to become one of his assistants. His enthusiasm and interest in the work led to his recognition as one of the leading spirits in the survey, and he gradually rose until he became assistant in charge of the bureau in Washington. This place he held until 1881, when, upon the death of Carlisle P. Patterson, he was appointed superintendent, which post he then held until 1885, when, on the advent of a new administration, after a faithful service of forty years, he was suspended, and

then allowed to resign. His age and failing health led to charges of incapacity, which a committee of investigation were unable to sustain. Alexander Agassiz, who declined to succeed him, in commenting on the behavior of the committee of investigation said: "Their dictum upon the late superintendent (Mr. Hilgard), at least as far as his professional career is concerned, is answered by his position as an investigator in the scientific world." While holding the place of assistant he had charge of the construction and verification of the standards of weights and measures, and was for some time engaged in preparing metric standards of great precision for distribution to the several States. In this connection he was appointed a delegate to the International Metric Commission, which met in Paris in 1872, and a member of the executive committee of the International Bureau of Weights and Measures. At the time of its organization, Mr. Hilgard was invited to become director of this bureau with its headquarters in Paris, but he declined. Mr. Hilgard's scientific work was chiefly in connection with his practical labors, consisting of researches and the discussion of results in geodesy and terrestrial physics, and in perfecting methods and instrumental means connected with the same. In 1872 he executed a telegraphic communication of the longitude between Paris and Greenwich, which superseded the value previously admitted, correcting it by nearly half a second of time. The magnetic survey of the United States, prosecuted at the expense of the Bache fund, derived from a bequest of Alexander D. Bache to the National Academy of Sciences, was placed by the Academy under the direction of Mr. Hilgard, and he also rendered great service to scientists throughout the United States by lending to them valuable instruments for original research. He was one of the original members of the National Academy of Sciences and long its home secretary. Mr. Hilgard joined the American Association for the Advancement of Science in 1850, and in 1874 was elected to be its presiding officer. He was a member of the American Philosophical Society, an associate fellow of the American Academy of Arts and Sciences, as well as a member of other scientific bodies in this country and abroad. His publications include papers, lectures, and addresses, which have appeared principally in the annual reports of the United States Coast Survey. His lecture on "Tides and Tidal Action in Harbors," delivered before the American Institute, in New York, was regarded as remarkable for its lucid and terse exposition of principles without the aid of mathematical symbols. Of the value of his life-work in connection with the United States Coast Survey it is said: "He brought into that branch of the public service a rare combination of culture, zeal, knowledge of the world, and executive ability, and no man living will claim to have done more than he did for the character and efficiency of the survey."

Hill, Joshua, lawyer, born in Abbeville District, S. C., Jan. 10, 1812; died in Madison, Ga., March 6, 1891. He received a liberal education and was admitted to the bar in South Carolina, and removed to Madison, Ga., in 1840. In 1844 he was a delegate to the Whig National Convention, and in 1857 and 1859 was elected to Congress, where he served as a member of the committees on Public Lands and on Foreign Affairs. While he was serving his second term his State adopted the ordinance of secession, and, being a strong Union man, and believing that he therefore could not properly represent his constituents, he resigned his seat, and lived quietly at home till the close of the war. He then allied himself with the Republican party, and used all his influence to secure the speedy political rehabilitation of the State. In 1866 he was appointed collector of the port of Savannah, and in the following year register in bankruptcy at the same place, but declined both offices. In July, 1868, he was elected United States Senator as a Union Republican, but he was not permitted to take his seat till Jan. 30, 1871, when he was appointed a mem-

ber of the committees on Privileges and Elections and on Pensions. He was a member of the State Constitutional Convention in 1877, and then retired.

Hill, Thomas, clergyman, ex-President of Harvard University, born in New Brunswick, N. J., Jan. 7, 1818; died in Waltham, Mass., Nov. 2, 1891. He was of English parentage, and was left an orphan when very young. When he was twelve years old he was apprenticed to a printer for three years. He then attended Lower Dublin Academy, near Philadelphia, for one year, and was next apprenticed to a New Brunswick apothecary. He was graduated at Harvard in 1843, and at the divinity school in 1845. The same year he became pastor of a Unitarian church in Waltham, where he remained fourteen years. In 1859 he followed Horace Mann as President of Antioch College, Ohio, and was at the same time in charge of the Church of the Redeemer, at Cincinnati. In 1862 he was made President of Harvard, but he resigned in 1868 on account of failing health and removed to Waltham. In 1871 he accompanied Louis Agassiz on his coast survey expedition to South America, and on his return accepted the charge of the Unitarian church at Portland, Me., which he held until his death. In June 1, 1891, he delivered a course of lectures at Meadville, Pa., Theological School, and while there he contracted the disease that resulted in his death. While President of Harvard he advocated the elective system, the first steps toward adoption of which were made at that time. He was a noted mathematician, and among several mathematical machines that he invented is the occultator, by which occultations visible west of the Mississippi were calculated for publication in the American Nautical Almanac for several years. From Harvard he received the degree of D. D. in 1860, and from Yale LL. D. in 1863. His talents were many and varied, and, in the opinion of those who knew him intimately for many years, he was capable of attaining almost the highest excellence in the exercise of any one that might have claimed the full employment of his powers. He delivered Phi Beta Kappa addresses at Harvard on "Liberal Education," 1858, and at Antioch on "The Opportunities of Life," 1860. He edited Ebert's "The Stars and the Earth," 1849 (new editions, Boston, 1874 and 1882). He was author of "Christmas, and Poems on Slavery" (1843); "Arithmetic" (1845); "Geometry and Faith" (New York, 1849; revised editions, 1874, Boston, 1882); "Curvature" (1850); "First Lessons in Geometry" (1854); "Second Book in Geometry" (1862); "Jesus the Interpreter of Nature and other Sermons" (1859); "Statement of the Natural Sources of Theology, with Discussion of their Validity and of Modern Skeptical Objections" (Andover, 1877); "Practical Arithmetic" (1881); "In the Woods and Elsewhere," verse (Boston, 1888).

Hitchcock, Robert S., educator, born in Newport, R. I., in 1818; died in Hollidaysburg, Pa., April 6, 1891. He was graduated at Amherst College in 1848, studied at Andover Theological Seminary, and after being ordained held pastorates in New Bedford and Boston, Mass. On retiring from his Boston charge he applied himself to educational work. He conducted for some time a classical school in Baltimore, served during the civil war as chaplain of the Second Maryland Regiment, and immediately after the war opened a classical school for boys in Lexington, Ky. In 1877 he was elected Professor of Latin in Center College, Danville, Ky., and in 1881 became principal of the Hollidaysburg Female Seminary and a member of the Huntingdon Presbytery, with both of which he remained till his death.

Hobbs, Alfred Charles, manufacturer, born in Charlestown, Mass., Oct. 7, 1812; died in Bridgeport, Conn., Nov. 6, 1891. He passed his early boyhood on a farm; undertook in turn to become a clerk, wood carver, carriage-maker, sailor, tin-plate worker for coach and harness trimmings, and glass cutter; and about 1840 removed to New York city and opened a store for the sale of locks and fire-proof safes. During the eight years of his work at glass cutting he

made a specialty of glass door-knobs, and patented a method of fastening the knobs in the sockets by which they were attached to the locks. Realizing that the bank and vault locks of the day were defective, he designed a lock which he claimed could not be picked, and, to show at once the necessity for and the utility of it, he made himself a fine set of tools for opening vaults and safes, and visited the large banks and public offices to introduce his own lock. His first call was at a bank in Stamford, Conn., whose officers promised to buy one of his locks if he succeeded in opening the locks on the outside of the bank door and those on the vault door in two hours. He opened the outside door and three locks on the vault door in twenty-three minutes, and sold his first lock. This feat he shrewdly advertised, and from that time, January, 1847, till 1851, he spent his whole time in visiting banks and proving the insecurity of their locks. In 1848 a Mr. Woodbridge, of Perth Amboy, N. J., published an offer of \$500 to any one who would open his lock, then on one of Herring's safes in the reading-room of the Merchants' Exchange, New York city, within thirty days. Mr. Hobbs came directly to New York, begun examining the lock at 9 o'clock in the evening, mastered its secret at 11.30 o'clock, requested Mr. Woodbridge to be present with witnesses the next morning at 10 o'clock, and at the time appointed inserted a wire and opened the lock immediately. In April, 1851, he went to London, in answer to a published offer of 200 guineas to any one who could open without a key a wonderful lock made by Brahma. In the presence of a large committee Mr. Hobbs spent fifty-one hours in working on the lock, and then, with a quick movement of one of his tools, threw the bolts and opened the door. Later he examined a lock made for a safe in the banking office of Brown, Shipley & Co., which it was believed could only be opened by a person knowing the special combination of letters indicated on a dial on the door. Mr. Hobbs desired to try it, and after the door had been locked, placed himself with his back to the dial, and with one hand behind him unlocked the safe while Mr. Brown was explaining why it could not be done. His success in opening locks in London gave him such fame that he found it advantageous to open a factory for the manufacture of his own locks there, and he soon commanded a handsome business. He remained in London till 1860, then took charge of the Howe Sewing Machine Works in Bridgeport, and in 1866 became superintendent of the Union Metallic Cartridge Works in the same city, with which he remained until his death. Mr. Hobbs received the Telford medal awarded by the English Institute of Civil Engineers for his successful lock-picking in London, and was elected a member of the Society of Arts.

Hodge, Caspar Wistar, educator, born in Princeton, N. J., Feb. 21, 1830; died there, Sept. 27, 1891. He was a son of the late Rev. Dr. Charles Hodge; was graduated at Princeton in 1848, and at the Theological Seminary in 1853; and was a tutor in the college in 1850-51, and a preparatory teacher in Princeton in 1852-53. In 1853-54 he was stated supply in a Presbyterian church in Williamsburgh, N. Y.; in 1854-56 his pastor; and in 1856-60 held a pastorate at Oxford, Pa. In 1860 he was appointed Professor of New Testament Literature and Biblical Greek in Princeton Theological Seminary, and he held the chair till his death. He had prepared for use in his class-room, but not for publication, valuable courses of lectures on "Gospel History" and "Apostolic History," and commentaries on Romans and Colossians, besides other works of a like character.

Hoffman, Ogden, jurist, born in New York city, Oct. 16, 1822; died in San Francisco, Cal., Aug. 9, 1891. He was graduated at Columbia College, and admitted to the bar, and became well known for his eloquence and success as a criminal lawyer. While practicing in New York city, his most famous case was the defense of a young society man named Robinson, for the murder of the pretty but frail Ellen Jewett, of

whom he had grown tired. It was believed at the time of the trial that Mr. Hoffman, before consenting to act as Robinson's counsel, had made him reveal the actual facts of the murder, and also confess his guilt. Mr. Hoffman's success in defending the client who had confessed his guilt arose from his attacking the credibility of the witnesses with all the eloquence and ability he could command, and the acquittal of the prisoner produced a sensation that is still remembered. Robinson soon disappeared, and his counsel, whose manner of defense had been warmly criticised in the periodicals and by members of the bar, removed to California, and settled in San Francisco in 1850. In the following year he was appointed judge of the United States district court for the Northern District of California, and he held the office continuously till his death.

Hopkins, John Henry, clergyman, born in Pittsburg, Pa., Oct. 28, 1820; died near Hudson, N. Y., Aug. 13, 1891. In 1831, when his father became Bishop of Vermont, the family removed to Burlington in that State, and the son was graduated at the University of Vermont in 1839. He was a tutor in the family of Bishop Elliott at Savannah, Ga., from 1842 to 1844, and in 1850 was graduated at the General Theological Seminary in New York city, and ordained deacon the same year. He founded the "Church Journal" in February, 1853, and continued its editor and proprietor till May, 1868. In 1872 he was ordained priest, and he was for four years rector of Trinity Church, Plattsburg, N. Y. In 1876 he became rector of Christ Church, Williamsport, Pa., an office which he filled for eleven years. In 1887 he was elected to the chair of the Evidences of Revealed Religion in the General Theological Seminary. He was the author of many hymns and carols, among them a very popular one entitled "We Three Kings of Orient are," and many pamphlets and reviews. His latest work was done for the "Church Review." He published a life of his father (1868); "The Canticles noted" (1866); "Carols, Hymns, and Songs" (4th ed., 1881); "Poems by the Wayside" (1883). He also edited his father's "The Pope not the Antichrist" (1868); "The Collected Works of Milo Mahan, with a Memoir" (3 vols., 1875); and Bishop Young's "Great Hymns of the Church" (1887).

Hopkins, Robert, clergyman, born in Bourbon County, Ky., in April, 1798; died in Sewickley, Pa., March 3, 1891. He was apprenticed to a cooper when thirteen years old, was soon afterward with his parents driven by the Indians into Ohio, where he was educated; and in 1825 joined the Pittsburg Conference of the Methodist Episcopal Church. He served as presiding elder for nineteen years; came within one vote of being elected bishop, despite his protests, in 1845; was five times a delegate to the General Conference of the Church; and was familiarly known as "Bishop" Hopkins. He was a pioneer in American Methodism, and his first charge was the Grand Rapids circuit, which was about 200 miles in extent, and required a month to travel it. He preached every day, and received for the first three years of his ministry \$63 in cash, a wagon, a scarf, and a pair of socks.

Horton, Nathaniel Augustus, journalist, born in Salem, Mass., April 16, 1830; died there, Dec. 14, 1891. He was graduated at the English High School, Salem, in 1846; was apprenticed to the printer's trade in the office of the "Salem Gazette"; was admitted to partnership in the publishing firm and became chief editor in 1854; and with his son, William A. Horton, formed the firm of N. A. Horton & Son in 1888. He was originally a Whig, and on the organization of the Republican party he espoused its mission and was faithful to it till death. In 1861-'62 he was a member of the Salem Common Council; in 1860, 1879, and 1880 of the State House of Representatives; and in 1881-'82 of the State Senate. He was also a delegate to the National Republican Convention in 1880. Mr. Horton was a founder and for two years President of the Massachusetts Press Association, an original and life trustee of the Salem Public Library, president

for many years of the Essex Conference of Liberal Christian Churches, and a member of the Essex Institute and the Essex Agricultural Society.

Houghton, George Washington Wright, poet, born in Cambridge, Mass., Aug. 12, 1850; died in Yonkers, N. Y., April 1, 1891. He was educated at the Cambridge High School and the Massachusetts Institute of Technology, and from 1869 till his death was editor of "The Hub," a New York journal devoted to the carriage-making interests. He was a frequent contributor to periodicals, and published "The Legend of St. Olaf's Kirk" (Boston, 1881); "Niagara and other Poems" (1883); and, under the pen-name of Chauncey Thomas, a story called "The Crystal Buton, or Adventures of Paul Prognosis in the Fortyninth Century" (1891).

Houk, Leonidas Campbell, lawyer, born in Sevier County, Tenn., June 8, 1836; died in Knoxville, Tenn., May 25, 1891. He had less than three months' schooling, and not only educated himself, but read law for the prescribed term while working at the cabinet-maker's trade. He was admitted to the bar when twenty-three years old, practiced with success till the opening of the civil war, was a delegate to the Loyal East Tennessee Convention early in 1861, and in August following entered the national army as a private. The same year he was promoted to lieutenant in the 1st Tennessee Infantry, and in February, 1862, he was commissioned colonel of the 3d Tennessee Infantry. In April, 1863, he was compelled by failing health to resign, and was then connected with the loyal press till July, 1864. In 1864 he was a candidate for presidential elector on the Republican ticket; in 1865 was a member of the State convention that amended the Constitution and provided for the reorganization of the State government; in March, 1865, he was elected judge of the 17th Judicial Circuit of Tennessee, and he held the office for four years; and then settled in Knoxville and resumed his law practice. Subsequently he held an office under the Southern Claims Commission. In 1868 he was a delegate to the National Republican Convention, and in 1872 he was presidential elector-at-large. In the latter year, also, he was elected to the Legislature, and was defeated for Speaker by a single vote. He was a presidential elector in 1876, and delegate-at-large to the National Republican Conventions of 1880, 1884, and 1888. In 1878, 1880, 1882, 1884, 1886, 1888, and 1890 he was elected to Congress from the 2d Tennessee District as a Republican, and in his last term he was a member of the committees on Elections, on Levees and Improvements of the Mississippi River, and on Militia. Judge Houk was the last survivor of a remarkable quartet of public men in Tennessee, Horace Maynard, William G. Brownlow, and Andrew Johnson having been associated with him in upholding the cause of the Union in that State at a time when loyalty called for the exercise of extreme prudence, and required the most unflinching moral and physical courage. He died from poison, accidentally self-administered.

Houseman, Julius, merchant, born in Leckendorf, Bavaria, Germany, Dec. 8, 1832; died in Grand Rapids, Mich., Feb. 8, 1891. He received a common-school and commercial education; removed to Grand Rapids, Mich., in 1851, and engaged in mercantile business and the manufacture of lumber. He was a city alderman in 1861-'70; member of the Legislature in 1871-'72; Mayor of Grand Rapids in 1873-'75; was defeated as Democratic candidate for Lieutenant-Governor of Michigan in 1876; and was member of Congress from the 5th Michigan District in 1883-'85. While in Congress he served on the Committee on Rivers and Harbors.

Hovey, Alvin Peterson, lawyer, born in Mt. Vernon, Ind., Sept. 6, 1821; died in Indianapolis, Ind., Nov. 23, 1891. He was apprenticed to the brick-maker's trade, and so improved his meager opportunities for study that when nineteen years old he began teaching, and when twenty-one was admitted to the bar. He was commissioned 1st lieutenant in the army for

service in Mexico in 1846; was a delegate to the State Constitutional Convention in 1850; judge of the 3d Judicial Circuit of Indiana in 1851-'54; appointed judge of the State Supreme Court in 1854; President of the Democratic State Convention in 1855; and United States District Attorney for Indiana in 1856-'58. In 1858 he was defeated for Congress; in August, 1861, was commissioned colonel 24th Indiana Volunteers; in April, 1862, was promoted brigadier-general; and in July, 1864, was brevetted major-general of volunteers. From 1865 till 1870 he was United States minister to Peru; in 1886 he was elected to Congress from the 1st Indiana District as a Republican, and he served on the Committee on Pacific Railroads; and he was elected Governor of Indiana in 1888.

Hubbard, Chester D., banker, born in Hamden, Conn., Nov. 25, 1814; died in Wheeling, W. Va., Aug. 23, 1891. He removed with his parents to Wheeling in 1819; was graduated at Wesleyan University, Middletown, Conn., in 1840; and became a banker and a heavy operator in iron and lumber. In 1852-'53 he was a member of the Virginia Legislature; and in 1861 was a delegate to the Virginia Convention in Richmond, where he opposed secession, and to the convention in Wheeling held soon afterward. Immediately after Virginia seceded he raised the first regiment of national volunteers south of the Ohio, enlisting ten full companies in Wheeling, and throughout the war he gave liberal aid to the national cause. In 1863-'64 he was a member of the Senate of the new State of West Virginia; in 1864 was a member of the National Republican Convention; and in 1865-'69 he was a member of Congress from the 1st West Virginia District, serving as a member of the committees on Manufactures and on Banking and Currency, and as chairman of the Committee on Expenditures in the Interior Department.

Hubbell, Algernon Sidney, lawyer, born in Lanesborough, Mass., Nov. 22, 1799; died in Newark, N. J., April 19, 1891. He was a son of Wolcott Hubbell, a Revolutionary soldier, State Senator of Massachusetts, and for many years judge of the County Court. The son studied law in Troy, N. Y.; was admitted to the bar in Massachusetts in 1824; was elected to the Legislature, and practiced in his native State till 1836. He then removed to Newark, N. J., where he was in active practice till within a few years of his death. Mr. Hubbell was a member of the New Jersey Legislature in 1847-'48; was one of the commissioners who prepared the amendments to the State Constitution in 1873; and served the city of Newark in various offices for several years.

Hutchins, Waldo, lawyer, born in Brooklyn, Conn., Sept. 30, 1822; died in New York city, Feb. 8, 1891. He was graduated at Amherst College in 1842, removed to New York city, studied law, and became a partner in the law firm of Schell, Slosson & Hutchins. In 1850 he was elected to the Legislature from King's County, being then a resident of Brooklyn, and also served as chairman of the Committee on the Judiciary. Three years afterward he made his permanent residence at King's Bridge. In 1855 he was appointed a member of the first park commission in New York city. In 1856 he declined the Democratic nomination for judge of the Supreme Court of the State; in 1867 was a delegate-at-large to the New York Constitutional Convention; and in 1879, 1880, and 1882 he was elected to Congress as a Democrat from the 12th (now 14th) New York District, the first election being to fill a vacancy. While in Congress he was a member of the committees on Expenditures in the Treasury Department, on Claims, on the Inter-oceanic Ship Canal (select), and on Appropriations, and was active in debates. In 1887 he was appointed a member of the present park commission, of which he was president in 1889-'90, and remained a commissioner till his death, giving in all fourteen years to the parks. Of all his law cases he took the most pride in his successful management of the Manhattan Savings Institution of New York city, after it

had been robbed of \$3,000,000 in securities in 1875. Through his efforts Congress, the State Legislature, and the city government authorized the issue of duplicates of the stolen bonds, and the institution and 17,000 depositors were protected.

Ingraham, Duncan Nathaniel, naval officer, born in Charleston, S. C., Dec. 6, 1802; died there Oct. 16, 1891. He was a son of Nathaniel Ingraham, who served with John Paul Jones in the action with the British brig "Serapia," and a nephew of Capt. Joseph Ingraham, who was lost at sea in the United States steamship "Pickering." He was appointed a midshipman in the United States navy when ten years old, was in active service in the war with England in 1812-'15, was promoted lieutenant in 1818, accompanied Com. David Porter on his expedition against the pirates in the Caribbean Sea, and became commander in 1838. After serving through the Mexican War he was sent in command of the "St. Louis" to join the American squadron in the Mediterranean, and dropped anchor in the harbor of Smyrna on June 22, 1853. The day previous Martin Koszta, a Hungarian and follower of Louis Kossuth in the revolution against Austria, who had lived two years in the United States and declared his intention of becoming a citizen, had been seized in Smyrna by a party of armed Greeks in the employ of the Austrian consul-general, and placed on board the Austrian man-of-war "Hussar." Commander Ingraham learned of the kidnapping directly after his arrival, and, visiting the "Hussar," satisfied himself of the truth of Koszta's declarations, and then formally demanded his release. While Commander Ingraham was awaiting official instructions from the United States *chargé d'affaires* in Constantinople, the Austrian man-of-war was re-enforced by six more war vessels, and when the "Hussar" attempted to leave the harbor with Koszta on board the American commander threatened to prevent departure by force and prepared his ship for action. On July 1 Ingraham received a commendatory reply from Constantinople, and at once made a demand for the surrender of Koszta by a specified hour, under penalty of extreme measures. After much parleying, it was agreed that the Austrian consul-general should deliver Koszta to the French consul to be held subject to legal determination of his case. The affair was made the subject of diplomatic correspondence between the United States and Austria, and was settled by Austria's acknowledging the rights of the United States in the premises and apologizing for the actions of her officials at Smyrna. Commander Ingraham received a gold medal and a letter of thanks from Congress, and numerous testimonials from private citizens. He was promoted captain in 1855, and appointed chief of the Bureau of Ordnance and Hydrography of the Navy Department in 1856. At the beginning of the civil war he resigned his commission, entered the Confederate naval service, and, as chief of the Bureau of Ordnance, Construction, and Repair, gained the rank of commodore.

Jay, John Clarkson, physician, born in New York city, Sept. 11, 1808; died in Rye, N. Y., Nov. 15, 1891. He was a son of Peter Augustus Jay and a grandson of John Jay, and was graduated at Columbia College in 1827 and at the College of Physicians and Surgeons in 1831. He practiced till his marriage, and then retired from business and professional pursuits to take charge of his estate at Rye. He was a founder of the Lyceum of Natural History (now the New York Academy of Sciences) and of the New York Yacht Club, and was a trustee of Columbia College from 1859 till 1880. Dr. Jay was best known for his work in connection with conchology. His costly library on the subject and his collection of shells, considered the most complete and valuable in the United States, were purchased by Catharine S. Wolfe and presented to the American Museum of Natural History as a memorial to her father. He examined, classified, and made an elaborate report on the shells gathered by Commodore Perry on his Japan expedition, and was author of "Catalogue of Recent Shells"

(1835) and "Description of New and Rare Shells" (1836), in which he enumerated 11,000 well-marked varieties and 7,000 well-established species.

Jerome, Leonard W., capitalist, born in Pompey Hill, Onondaga County, N. Y., in 1818; died in Brighton, England, March 3, 1891. He was educated at Princeton and at Union College, studied law in Albany, N. Y., and was admitted to the bar in 1840. Preferring journalism to law, with his brother, Lawrence R. Jerome, he established the Rochester "American," which was made a success as a strong Whig organ. After the inauguration of President Fillmore, Leonard Jerome was appointed United States consul at Trieste and Lawrence Jerome collector of the port of Rochester. On the election of Franklin Pierce to the presidency, the Jerome brothers retired from political life, sold their newspaper, and removed to New York city, where two other brothers had already established themselves. Leonard Jerome began operating in Wall Street, and about a year afterward formed a partnership with his brother Addison G. Jerome and the late William R. Travers. The firm soon became noted for its boldness in dealing in stocks and bonds of large railroad corporations, and made and lost a great deal of money. In one operation Mr. Jerome lost \$600,000, and in another \$800,000. During the civil war he gave liberally of his money to aid the national cause. He paid the whole expense of the first great Union meeting in the Academy of Music, was treasurer of the Union Defense Committee, and personally kept a large sum in its treasury; founded the Riot Relief fund for the benefit of the families of those killed and wounded in the draft riots of 1863; subscribed \$35,000 toward building a fast cruiser to pursue the "Alabama"; and took pleasure in heading popular subscription lists for patriotic and charitable purposes. Mr. Jerome was an enthusiast in turf and yachting affairs. He established the long popular racing track of Jerome Park at Fordham, N. Y., paid \$40,000 for the horse "Kentucky," and aided in organizing and was president of the New York and the Coney Island Jockey Clubs. In yachting he was the original owner of the "Undine," and part owner of the "Restless" and "Dauntless," and built the unsuccessful steam yacht "Clara Clarita."

Johnson, Ebenezer Alfred, educator, born in New Haven, Conn., Aug. 18, 1813; died in Yonkers, N. Y., July 18, 1891. He was graduated at Yale College in 1833; remained there for several years as a tutor, meanwhile studying law; was admitted to the bar, but decided not to practice; and in 1838 was appointed assistant Professor of Greek and Latin in the University of the City of New York. Two years afterward he was appointed Professor of Latin, and held the chair till his death. In early life Prof. Johnson published educational works, including editions of the orations of Cicero and Cornelius Nepos, but in later years he wrote little.

Jones, George, publisher, born in Poultney, Vt., Aug. 16, 1811; died in South Poland, Me., Aug. 12, 1891. He became errand boy and afterward clerk in the store of Amos Bliss, a country merchant, who also published "The Vermont Spectator." At that time Horace Greeley was a compositor on the paper, and a friendship was formed between the lads that ultimately led Mr. Jones to enter journalism. He removed to New York city in 1833, and was urged by Mr. Greeley to become a partner in his projected "Tribune," but declined the invitation, though he afterward accepted a subordinate place in the business office. When Mr. Jones retired from the "Tribune" office he went to Albany, N. Y., and engaged first in the news agency business and afterward in banking. In 1851 he sold out his banking business, returned to New York, and, in association with Henry J. Raymond and Edward D. Wesley, founded the New York "Times." Mr. Wesley retired from the partnership in 1860, and after the death of Mr. Raymond, in 1869, Mr. Jones became head of the firm and remained so till his death. The most memorable event in Mr. Jones's long and busy career was his warfare on the

Tweed ring, which resulted in the downfall of the ring and the conviction of its leaders.

Joy, Charles Arad, chemist, born in Ludlowville, Tompkins County, N. Y., Oct. 8, 1823; died in Stockbridge, Mass., May 29, 1891. He was graduated at Union College in 1844 and at the Cambridge Law School in 1847, and in the latter year was appointed on the United States Geological Survey of the Lake Superior region. Subsequently he studied chemistry in Berlin, Göttingen, and Paris. On his return he was appointed Professor of Chemistry in Union College, where he remained till 1857, when he was chosen to the similar chair in Columbia College, which he resigned in 1877. He was a member of the juries of the world's fairs at London, Paris, Vienna, and Philadelphia; was President of the Lyceum of Natural History (now the New York Academy of Sciences) in 1866; President of the American Photographic Society, chairman of the Polytechnic Association of the American Institute, foreign secretary of the American Geographical Society, and a member of many scientific bodies. He had edited "The Scientific American" and "The Journal of Applied Chemistry," and written the chemical articles in the "American Cyclopædia." Prof. Joy's special work was his investigation of the combination of alcohol radicles with selenium and of the compounds of glucinum.

Kelley, Benjamin Franklin, military officer, born in New Hampton, N. H., in 1807; died in Oakland, Md., July 16, 1891. In 1826 he settled in Wheeling, W. Va., where he was engaged in mercantile business till 1851, when he became freight agent of the Baltimore and Ohio Railroad. During his residence in Wheeling he took an active part in public affairs, and when State after State was adopting the ordinance of secession, he exerted a large interest in keeping the western part of Virginia loyal. On the first call for national volunteers he raised the 1st Virginia Regiment, and was commissioned its colonel on May 25, 1861. Two days afterward he marched toward Grafton, held by a Confederate force, which retreated to Philippi on his approach, and on June 3 attacked the enemy at the latter place, fighting one of the first battles in the civil war. In this engagement he was severely wounded, and was compelled to retire from his command for two months. During his convalescence he was promoted brigadier-general, and on returning to the field he was assigned by Gen. McClellan to the command of the railroad division. On Oct. 22, 1861, he fought a brilliant battle at Romney, for which he was complimented by President Lincoln and Gen. Scott. He was then assigned to the command of the Department of Harper's Ferry and Cumberland, but in January, 1862, he had to seek relief from active service on account of his wound. In the summer following he returned to his command. In July, 1863, he was given command of the Department of West Virginia. He pursued Gen. Lee after his passage of the Potomac, and in November destroyed the Confederate camp under Gen. Imboden, near Moorfield, Va. During the summer of 1864 he defeated the Confederates at Cumberland, New Creek, and Moorfield, for which he was brevetted major-general in 1865. After the close of the war he was appointed collector of internal revenue for the 1st West Virginia District; in 1876 he was made superintendent of the Hot Springs Reservation in Arkansas; and in 1883 he became an examiner of pensions. It has been claimed for him that in all his engagements with the Confederates he was never defeated.

Kendrick, Henry Lane, military officer, born in Lebanon, N. H., Jan. 20, 1811; died in New York city, May 24, 1891. He was graduated at the United States Military Academy and appointed brevet 2d lieutenant in the 2d United States Infantry, July 1, 1835; was promoted 2d lieutenant, April 1, 1836, and transferred to the 2d Artillery in June following; promoted 1st lieutenant, June 20, 1837; captain, June 18, 1846; appointed Professor of Chemistry in the United States Military Academy, March 3, 1857; appointed brigadier-general of volunteers, Sept. 23, 1861, but declined

to serve, and was retired with the brevet rank of major and the pay of a colonel, Dec. 13, 1880. He was Assistant Professor of Chemistry, Mineralogy, and Geology at the United States Military Academy in 1835-'47; was engaged in the siege of Vera Cruz, the battle of Cerro Gordo, and the defense of Pueblo in the Mexican War; commanded the escorts of the topographical parties exploring the Indian country from Zuni river, New Mexico, to San Diego, Cal., in 1851, and the country between the Republican Fork and Arkansas river in 1852; and was Professor of Chemistry, Mineralogy, and Geology at the Military Academy in 1857-'80.

Kenly, John Reese, lawyer, born in Baltimore, Md., in 1822; died there, Dec. 20, 1891. He received a private-school education, and was admitted to the bar in 1845. At the beginning of the Mexican War he raised a company of volunteers, and was elected captain. He took part in the advance of Gen. Taylor from Bravo del Norte to Monterey and in the battles that led to the fall of that city, and when Col. William H. Watson fell he rallied his battalion, and kept it in action till the close of the battle. After serving a year he returned to Baltimore, and almost immediately re-entered the service as major and went back to Mexico, where he remained till the close of the war. He then began practicing law, was an unsuccessful Whig candidate for the Legislature and Congress, and was voted the thanks of the State by the General Assembly for his gallantry in Mexico. On June 11, 1861, he was commissioned colonel 1st Maryland Regiment; in May, 1862, he aided in saving the national force under Gen. Banks at Front Royal by checking a Confederate advance, but was himself wounded and taken prisoner; and on Aug. 22 following he was promoted brigadier-general for this service. Later he was in command of all the troops in Baltimore outside the forts, and he further distinguished himself at Hagerstown and at Harper's Ferry. In 1863 he performed one of his most brilliant acts in leading the Maryland Brigade at the recapture of Maryland Heights. He served in the 1st and 8th Army Corps till the close of the war, and was rewarded with the brevet of major-general on March 13, 1865, the thanks of the General Assembly of Maryland, and a sword by the corporation of Baltimore. Gen. Kenly refused to apply for a pension, lost his home in 1890 because unable to pay taxes, and died poor. He published "Memoirs of a Maryland Volunteer in the Mexican War" (Philadelphia, 1873).

Kidder, Daniel Pariah, clergyman, born in Darien, N. Y., Oct. 18, 1815; died in Evanston, Ill., July, 29, 1891. He was graduated at Wesleyan University, Middletown, Conn., in 1836, entered the ministry of the Methodist Episcopal Church, was on missionary duty in Brazil in 1837-'40, and was the first man to deliver a Protestant sermon on the banks of the Amazon, and held pastorates in Paterson and Trenton, N. J., in 1840-'44. In 1844 he was appointed editor of the Sunday-school publications and tracts of the Methodist Book Concern, and he held the office till 1856, when he became Professor of Practical Theology in Garrett Biblical Institute, Evanston, Ill. In 1871 he resigned to accept a similar chair in Drew Theological Seminary, Madison, N. J., which he occupied till 1880. He was then elected secretary of the Methodist Episcopal Board of Education in New York city, where he remained till 1887. He had since lived in retirement at Evanston. He published "Mormonism and Mormons" (New York, 1841); "Sketches of Residence in Brazil" (2 vols., 1845); "The Christian Pastorale" (Cincinnati, 1871); "A Treatise on Homiletics" (New York, 1864); and "Helps to Prayer" (1874); a translation from the Portuguese of Feijó's "Necessity of abolishing a Constrained Clerical Celibacy" (New York, 1844); and, with the Rev. J. C. Fletcher, "Brazil and the Brazilians" (Philadelphia, 1857).

Kiddle, Henry, educator, born in Bath, England, in 1824; died in New York city, Sept. 25, 1891. He came to New York city when nine years old, began

teaching under the direction of the Public School Society when thirteen, and was the first principal of the first school established by that society, which was the predecessor of the present Board of Education, when seventeen. As the society established new schools he was placed in charge temporarily to direct their organization, and became assistant superintendent under Samuel Randall. While thus engaged in educational work he studied law with Samuel J. Tilden, and was admitted to the bar in 1848. In 1870 he succeeded Mr. Randall as superintendent of public schools, and resigned the office of principal of the Saturday Normal School, which he had held for several years. In 1879 he published "Spiritual Communications," a book that created considerable excitement and raised the question of Prof. Kiddle's further usefulness as superintendent, which he solved in 1880 by resigning. He then applied himself to the investigation of spiritualism, and wrote and lectured on the subject. He was associated with Prof. A. J. Schem in the compilation of the "Encyclopædia of Education" (New York, 1876), for which the University of France made him an officer of the Academy; and he published a "Dictionary of Education," a series of "Educational Year-books," and works on astronomy, grammar, and physics.

Kimball, Charles T., manufacturer, born in Bethel, Me., in 1826; died in New York city, March 19, 1891. He was brought up on a farm, bought his time from his father when eighteen years old, went to Bridgeton, Me., where he attended school and learned carriage-making, and in 1847 established a carriage factory of his own in Norway, Me. He was prosperous from the start, and built up one of the largest carriage factories in New England. Settling in Portland, he became active in public affairs, and held several municipal offices; was a war Democrat in 1861-'65, and was twice defeated for governor, although he polled a larger vote than any other Democratic candidate for that office had ever received in Maine. In 1876 he was appointed a Centennial commissioner from New York; subsequently he removed to Chicago, and established the largest carriage factory in that city, and in 1885-'87 he was United States consul at Stuttgart.

King, Francis T., philanthropist, born in Baltimore, Md., Feb. 25, 1818; died there, Dec. 19, 1891. He was a member of the Orthodox Society of Friends, made a large fortune as a member of the firm of King, Carey & Howe, and for nearly twenty years had applied himself wholly to charitable work and to large administrative duties intrusted to him. He was President of the Board of Trustees of the Johns Hopkins Hospital, director of the Johns Hopkins University, executor of the estate of Thomas Wilson, the philanthropist, President of the Thomas Wilson Sanitarium, director of the Samuel Ready Orphan Asylum, President of the Maryland Bible Society, founder of the Central Savings Bank, President of the Board of Directors of Bryn Mawr College, and an official in many financial institutions. He gave liberally, but it is doubtful if any one knows the extent.

Kinlock, Robert Alexander, physician, born in Charleston, S. C., Feb. 20, 1826; died there, Dec. 23, 1891. He was graduated at the College of Charleston in 1845, and at the medical department of the University of Pennsylvania in 1848, and after spending two years in study in London, Edinburgh, and Paris, returned to Charleston and practiced there till his death. At the beginning of the civil war he entered the Confederate army as surgeon, and he remained in the field till the close of the war. He attended the wounded Confederates in the first Bull Run battle, was medical director on the staffs of Gens. Lee, Beauregard, and Pemberton, and inspector of hospitals in South Carolina, Georgia, and Florida; was captured near Wimsborough, S. C., while trying to reach the Confederate army in North Carolina, on Feb. 22, 1865, and was released soon afterward as a non-combatant. In 1867 he was elected Professor of Materia Medica and Therapeutics in South Carolina Medical College, soon afterward he was made Professor of Surgery

there; and subsequently he was chosen dean of the college, and he held the office till his death. Dr. Kinlock was the first surgeon of the Roper Hospital, attending surgeon of the City Hospital, and surgeon and gynecologist to the St. Xavier Infirmary. He was a member of many medical associations, was a delegate to the International Medical Congress in 1876, was elected Vice-President of the American Medical Association in 1883, and was a visitor to the Berlin Medical Conference in 1890. He is said to have been the first surgeon in the United States to make a resection of the knee joint for chronic disease, and the first to treat fractures of the lower jaw and other bones by wiring the fragments. He was also credited with being the first surgeon that ever performed laparotomy for gunshot wound of the abdomen without a protrusion of the viscera. Dr. Kinlock wrote surgical treatises and invented instruments that are now in general use.

Knight, Cyrus Frederick, clergyman, born in Boston, Mass., March 28, 1831; died in Milwaukee, Wis., June 8, 1891. He was educated at Burlington College and Harvard University, and was graduated at the General Theological Seminary in New York city in 1854. In the same year he was ordained deacon, and in 1856 took priest's orders. From 1857 to 1867 he was rector of St. Mark's Church, Boston, and from 1867 to 1877 ministered to St. James's Church, Hartford, Conn. In the latter year he removed to Lancaster, Pa., to become rector of St. James's Church there, which place he filled until he was consecrated Bishop of Milwaukee on March 26, 1889. The short period of his episcopate was one of constant activity on the part of Bishop Knight, his labors continuing up to the time of his last brief illness. His only published works are occasional sermons and "Charges in the Communion Office" (1886).

Koppernagel, Clement, clergyman, born in Westphalia, Germany, in 1839; died in Harrisburg, Pa., Nov. 27, 1891. He was ordained a priest in the Roman Catholic Church in 1865, and went to Harrisburg and organized the first German Catholic congregation in that section. He designed the present church building, the largest in the city, and built it mainly with his own hands, spending twelve years in the work, and attending to his growing congregation meanwhile. He carved or made and set the main altar, pulpit, oratorium, communion railing, St. Joseph's and the blessed Virgin's side altars, the baptismal font, the confessional box, and the fourteen stations of the cross. The stained-glass windows are the largest in the city, and one of them, designed, cut, and made by him, contains 223 pieces of glass, and represents the Virgin Mary. The church is an object of great interest in Harrisburg, and its pastor was widely known for his diversified gifts.

Lamport, William Henry, legislator, born in Pitts-town, N. Y., May 27, 1811; died in Canandaigua, N. Y., July 21, 1891. He received a district-school education, and became a farmer. In 1848-'49 he was supervisor of Gorham, N. Y.; in 1851 was elected sheriff of Ontario County; in 1854 a member of the State Assembly; in 1866-'67 trustee and president of the village of Canandaigua; and in 1870-'72 member of Congress from the 26th New York District, as a Republican. While in Congress he served on the committees on Agriculture and on Expenditures in the War Department.

Latrobe, John Haslehurst Boneval, lawyer, born in Philadelphia, Pa., May 4, 1803; died in Baltimore, Md., Sept. 11, 1891. He was a son of Benjamin H. Latrobe, the architect who designed the National Capitol at Washington, the Roman Catholic Cathedral at Baltimore, and the Bank of Philadelphia. He received a collegiate education; took part of the course at the United States Military Academy, resigning in 1820 on account of the death of his father; and was admitted to the bar in Baltimore in 1825. In 1828 he was engaged by the Baltimore and Ohio Railroad Company to secure the right of way for the road from Point of Rocks to Williamsport, and he re-

mained with the company as its counsel till his death. He was the sole survivor of the party that accompanied Peter Cooper on the trip with the first locomotive used in the United States, which undertook to run between Ellicott's Mills and Baltimore in competition with the English "Gray Mare" in 1830.

When Samuel F. B. Morse was making his early experiments with his system of magnetic telegraphy Mr. Latrobe was the first man in a place of influence to recognize the utility of the scheme, and from 1837 till the opening of the first telegraph line, between Baltimore and Washington, on May 24, 1844, he gave Prof. Morse substantial aid and encouragement. After Ross Winans had secured a contract from the Russian Government for the construction and equipment of a railroad from St. Petersburg to Moscow for \$3,000,000, Mr. Latrobe accompanied Mr. Winans's sons Thomas De Kay and William Lewis to Russia to begin the work, about 1842. In 1858, when the Winanses were unable to secure from the Russian Government a full settlement for their railroad work, they sent Mr. Latrobe to St. Petersburg as their attorney, and on his collection of the amount due they paid him the large fee, for those days, of \$60,000. About 1824 Mr. Latrobe became deeply interested in the movement to colonize the colored people of the United States in Africa. Subsequently he was elected President of the Maryland Colonization Society, and on the death of Henry Clay succeeded him as president of the national society. In connection with this work he became a founder of the Republic of Liberia, and prepared the first map of the region. He also induced the Maryland society to establish a Maryland colony at Cape Palmas, for which the State appropriated \$275,000. A form of government for the colony was prepared by him; and, after an independent, successful existence of more than twenty years, the colony was merged with the Liberian republic. Mr. Latrobe was the oldest student of the United States Military Academy, the oldest lawyer in Maryland, and the oldest railroad official in the country, and had been President of the Board of Visitors to the United States Military Academy, president of the American branch of the Association for the Exploration of Africa, and President of the Maryland Historical Society. With all his activity in legal, railroad, and public affairs, he found time to gratify a natural taste for invention, and to his genius is due the existence of the popular "Baltimore heater." To the city of Baltimore he gave largely of his time and thought. He was the originator of its admirable park system, and was a founder or director of its leading financial and charitable institutions. He was also an accomplished artist and a voluminous writer. Besides a series of juvenile books (1826, four novelettes, and an address in Washington on "The Capitol and Washington at the Beginning of the Present Century" (Baltimore, 1881), he published "Biography of Charles Carroll, of Carrollton" (Philadelphia, 1824); "Justices' Practice" (Baltimore, 1825; seventh edition, 1880); "Scott's Infantry and Rifle Tactics" condensed (1828); "Picture of Baltimore" (1832); "History of Mason and Dixon's Line" (Philadelphia, 1854); "Personal Recollections of the Baltimore and Ohio Railroad" (Baltimore, 1858); "Hints for Six Months in Europe" (Philadelphia, 1869); "Odds and Ends," a volume of poems (printed privately, Baltimore, 1876); "History of Maryland in Liberia" (Baltimore, 1885); and "Reminiscences of West Point in 1813 to 1822" (1887).

Lazarus, Jacob H., artist, born in New York city in 1825; died there, Jan. 11, 1891. He studied painting in his native city, principally with William Inman:

became a portrait painter of high merit, and was much esteemed as a restorer of old paintings and as an expert on the character and value of paintings in general. Among his patrons in portraiture were three generations of the Astor family, the Belmonts, Dr. Fordyce Barker, Gould Redmond, and many well-known citizens of New York, Boston, Brooklyn, and Philadelphia. He was for many years a member of the National Academy of Design.

Lea, Albert, civil engineer, born in Tennessee, in July, 1808; died in Corsicana, Tex., Jan. 17, 1891. He was graduated at the United States Military Academy in 1831, was assigned to duty at Fort Gibson, then on the extreme Western frontier, and was placed in command of a military surveying expedition to the region of Minnesota river in 1836. Soon after completing and reporting on the expedition, he resigned from the army and engaged in civil engineering. In 1841 he was appointed chief clerk in the War Department at Washington, and for a time during President Fillmore's administration he was acting Secretary of War. Subsequently he became Professor of Mathematics in the University of East Tennessee, and after seven years' service went to Texas in the interest of several railroad enterprises. During the civil war he served on the staff of Gen. Magruder, of the Confederate army, as chief of engineers. A railroad route and the town of Albert Lea, in Minnesota, were named for him. He had resided in Texas for more than thirty years, mainly in Galveston.

Learned, Amos F., journalist, born in Boston, Mass., in 1829; died in Poughkeepsie, N. Y., March 8, 1891. He was apprenticed to the printer's trade when a boy, in the office of the Boston "Transcript," and after working on the "Boston Shipping List," the "Chronotype," and the "Boston Atlas," became agent of the New England Press Association in New York in 1859. He held this office till 1882, when he resigned to take an editorial place on the New York "Mail and Express," with which he was connected for six years. He afterward engaged unsuccessfully in manufacturing. During his long service as press agent he became intimate with the principal public men of the country. He was an ardent admirer of Gen. Grant, and as a delegate to the National Republican Convention at Chicago in 1860 was one of the band of 306 who voted steadily to give the ex-President a third nomination. President Arthur appointed him United States consul at Melbourne, Australia, but he declined the office.

Le Conte, John, physicist, born in Liberty County, Ga., Dec. 4, 1818; died in Berkeley, Cal., April 29, 1891. He was the second son of Louis Le Conte, who followed the sciences with the ability of a scholar and the love of an enthusiast, undertaking an investigation for the pleasure it gave him, and freely giving the results to those who asked for them. His uncle, Major John E. Le Conte, of the United States Engineers, was an ardent botanist and a frequent visitor to the plantation home of Woodmanston. Under these influences young Le Conte grew to boyhood, and then passed to the care of Alexander H. Stephens, who prepared him for Franklin College, now the University of Georgia, where he was graduated in 1838. Choosing medicine as his profession, he was graduated at the College of Physicians and Surgeons, in New York, in 1841. He settled in Savannah, Ga., in 1842, and there began the practice of his profession, but in 1846 abandoned medicine to accept the chair of Natural Philosophy and Chemistry in Franklin College. This post he held until 1855, when he resigned to become lecturer on chemistry in the College of Physicians and Surgeons, in New York, but in 1856 accepted the chair of Natural and Mechanical Philosophy created for him at the South Carolina College, in Columbia. He continued in this place until the college was disbanded by the civil war, when he took charge of the Niter and Mining Bureau of South Carolina, but resumed his professorship in 1866, when the University of South Carolina was re-organized. In 1869 he was called to the chair of

Physics, Industrial Mechanics, and Physiology in the University of California, then recently created. He became its acting president, and drew up the first prospectus of the university. Subsequent to the arrival of President Daniel C. Gilman he returned to the charge of his chair, but again, when President Gilman was called to the Johns Hopkins University, Prof. Le Conte became, first, acting president, and then, from 1876 till 1881, president of the university, continuing in the mean while to discharge the duties of his chair, to which he retired in 1881 and continued to hold until his death. His scientific work extended over fifty years, and at first was in the line of medical investigation, but subsequently became confined almost exclusively to physical science. Mechanics, heat, sound, light, and electricity were among the subjects studied by him, but his first choice was sound, and to that department in 1857 he contributed his discovery of the sensitiveness of flame to musical vibrations, which has served as the starting-point in the exquisite applications that have since been worked out by the use of flame for the detection of sounds too delicate for the ear to perceive, and for the optical analysis of compound tones. His original papers were more than one hundred in number, and were published in scientific journals both in this country and abroad, also in the "Proceedings of the American Association for the Advancement of Science," to which organization he served as general secretary in 1857. During the same year he delivered a course of lectures on the "Physics of Meteorology" at the Smithsonian Institution in Washington, D. C., and in 1867 one of four lectures on the "Stellar Universe" at the Peabody Institute, in Baltimore, Md.

The degree of LL. D. was conferred on him by the University of Georgia in 1879, and in 1878 he was elected to the National Academy of Sciences. He was a member of the American Philosophical Society and a corresponding member of the Philadelphia and New York Academies of Science. A treatise on "General Physics," nearly completed by him, was destroyed in the burning of Columbia, S. C., in 1865.

Lee, William Henry Fitzhugh, military officer, born in Arlington, Va., May 31, 1837; died in Ravensworth, Va., Oct. 15, 1891. He was the second son of Gen. Robert E. Lee, was graduated at Harvard in 1857, and in the same year was appointed a 2d lieutenant in the 6th United States Infantry, and accompanied Col. Albert Sidney Johnston's military expedition to Utah. In 1859 he resigned his commission and applied himself to the care of his White House estate on Pamunkey river. At the beginning of the civil war he raised a company of cavalry for the Confederate

ate army, and during the war served successively in every grade from captain to major-general. In June, 1863, he was wounded at Brandy Station; later in the year he was captured in Hanover County, Va., and was confined as a hostage nearly a year in Fort Monroe and in Fort Lafayette, New York harbor; in 1864 was exchanged; and he afterward commanded a division till the final surrender at Appomattox. He resided on his plantation from 1865 till 1874, when he removed to Burke's Station. In 1875 he was elected to the State Senate, and in 1886, 1888, and 1890 was elected to Congress from the 8th Virginia District as a Democrat. He served as a member of the committees on the District of Columbia, on Expenditures in the State Department, on Accounts, and on Real-Estate Purchases by District Commissioners.

Lee, William Raymond, military officer, born in Marblehead, Mass., Aug. 15, 1807; died in Roxbury, Mass., Dec. 26, 1891. He was a grandson of Col. William Raymond Lee, of the Revolutionary army, and was educated at the United States Military Academy in the class of 1829, but was obliged to leave before graduation. Subsequently he became a civil engineer and Superintendent of the Boston and Providence Railroad. At the beginning of the civil war he tendered his services to Gov. Andrew, who appointed him colonel of the 20th Regiment of Massachusetts Volunteers. On Oct. 21, 1861, he was taken prisoner during the battle of Ball's Bluff, and for several months he was confined in Richmond as a hostage for Confederate privateersmen who had been captured by the national forces. After the Federal Government had agreed to treat the privateersmen as ordinary prisoners of war, Col. Lee was exchanged, and soon rejoined his regiment. He commanded it in the principal battles fought by the Army of the Potomac till that of Fredericksburg, distinguished himself at Fair Oaks, and at Glendale commanded three regiments, and was severely injured by a horse falling on him. After he had served through the Antietam campaign his injuries forced him to resign, and he retired with the brevet rank of brigadier-general, for gallantry at Antietam and during the war.

Leidy, Joseph, naturalist, born in Philadelphia, Pa., Sept. 9, 1823; died there, April 30, 1891. His ancestors were of German descent, and he was destined by his parents to be an artist, but an early fondness for botany and mineralogy led to his passing his leisure

in a wholesale drug store, where he further acquired a knowledge of pharmacy and chemistry, to which he added comparative anatomy. With this foundation he began in 1840 the study of medicine under Dr. Paul B. Goddard, and was graduated from the medical department of the University of Pennsylvania in

1844. Immediately he became assistant to Robert Hare and James B. Rogers in the chemical laboratories of the university, and also began the practice of medicine. The latter he discontinued in 1846 in order to devote himself exclusively to teaching. Meanwhile, in 1845, he became prospector to the chair of Anatomy in the University of Pennsylvania, then held by Dr. William E. Homer, and in 1846 was elected demonstrator of anatomy in the Franklin Medical College, but this he relinquished after a single term in order to return to Dr. Homer, with whom he gave a private course of anatomical lectures in 1847; also in 1848 he visited Europe with Dr. Homer, examining the museums and hospitals there. In 1849 he began a course of lectures on physiology at the Medical Institute, but failing health compelled him to give these up, and in 1850 he again visited Europe in order to aid Dr. George B. Wood in forming the collection of specimens and models used in the department of materia medica. Owing to Dr. Homer's illness in 1852, he was called to deliver the lectures in that department, and in 1853, on the death of his associate, he was elected to the full possession of the chair of Anatomy, which post, together with that of honorary dean of the medical faculty, he held until his death. During the civil war he entered the United States Volunteer Service and was contract surgeon in the Satterlee General Hospital in Philadelphia, Pa. His special duty was to report on the more important post-mortem examinations, and several of his reports with his own drawings were published in the "Medical and Surgical History of the Rebellion." In 1871 he was chosen Professor of Natural History to Swarthmore College, and in 1884, on the establishment of the department of biology and the auxiliary department of medicine in the University of Pennsylvania, he was made its director. He also held the chair of Zoology and Comparative Anatomy in the faculty of the college department in the University. Prof. Leidy was an accomplished draughtsman; and in 1844, when Dr. Amos Binney began the publication of his great work on the "Terrestrial Air-breathing Mollusks of the United States," he selected Prof. Leidy to dissect and draw the internal organs of the species that were to be described. The result was the production of 16 plates giving the anatomy of 38 species of native mollusks and the chapter entitled "Special Anatomy of the Terrestrial Mollusks of the United States." In 1847 he published his first paleontological paper, "On the Fossil Horse of America," in which he clearly established the existence of a species, for which he proposed the name of "*Equus americanus*." This subject, with later discoveries in the hands of Thomas H. Huxley and Othniel C. Marsh, has been largely used as a demonstration of the theory of evolution. His work in this direction included the determination of the former existence of a tropical climate on the Western slope in which lived varieties of lion, tiger, camel, rhinoceros, and other forms of animals having no living representatives in the United States. Many of the earlier specimens obtained on the various surveys under the United States Government were submitted to him for study and report. His earlier work in paleontology had to do with the larger forms, but in recent years he devoted himself to the lower orders. Prof. Leidy received the Walker prize of \$1,000 from the Boston Society of Natural History in 1880, and the Lyell medal with the sum of £25 from the Geological Society of London "in recognition of his valuable contributions to paleontology" in 1884, and the degree of LL. D. was conferred upon him by Harvard in 1886. He was elected to the Academy of Natural Sciences of Philadelphia in 1845, and from 1846 till his death held the office of chairman of curators and that of president, subsequent to 1882. In 1849 he was elected to the American Philosophical Society, and was an associate fellow of the American Academy of Arts and Sciences. He was chosen to the National Academy of Sciences in 1864, and was a member of other scientific societies in this country and abroad. The titles of his

published papers exceed 800 in number, and were all on biological subjects. Among them are "Memoir on the Extinct Species of the American OX" (1852); "A Flora and Fauna within Living Animals" (1853); "Ancient Fauna of Nebraska" (1853); "On the Extinct Sloth Tribe of North America" (1855); "The Cretaceous Reptiles of the United States" (1855); "The Extinct Mammalian Fauna of Dakota and Nebraska" (1869); "Contributions to the Extinct Vertebrate Fauna of the Western Territories" (1873); "Description of Vertebrate Remains from the Phosphate Beds of South Carolina" (1877); "Fresh-water Rhizopods of North America" (1879); "The Parasites of the Termites" (1881); "On Manayunkia Speciosa" (1883); and "Tape-worms in Birds" (1887). The foregoing were all issued by the Academy of Natural Sciences, the Smithsonian Institution, and under the auspices of the National Government as special monographs. He edited an edition of Sharpley and Quain's "Anatomy," and wrote "An Elementary Text-book on Human Anatomy" (Philadelphia, 1861; new edition 18). In his memory a fund of \$50,000 is being collected in order to establish a Leidy Memorial Museum as an independent part of the museum now forming at the University of Pennsylvania.

Leonard, William Henry, jurist, born in Amenia, Dutchess County, N. Y., June 11, 1812; died in Bedford, Westchester County, N. Y., May 30, 1891. In early life he went to Hudson, N. Y., where he studied law and was admitted to the bar, and was afterward a partner of John T. Hoffman, Gilbert M. Spier, Samuel M. Woodruff, and Chief-Justice Charles H. Van Brunt. On May 12, 1872, he was appointed a justice of the Supreme Court of New York, to fill a vacancy. Besides his service on this bench, he was a member of the Commission of Appeals, which had charge of the organization and prepared the calendar for the newly established Court of Appeals. For ten years he lived in retirement.

Lippitt, Henry, manufacturer, born in Providence, R. I., Oct. 9, 1818; died there, June 5, 1891. He received an academical education, became a clerk in a cotton-brokerage office in Providence in 1835, and afterward was a partner in several large manufacturing firms, including Walcott & Lippitt, Amory, Chapin & Co., and the Quinebaug Manufacturing Company, and in the Coddington, Social, and Harrison Cotton Mills. In 1858 he gave up the commission part of his business to confine himself to his manufacturing interests. He was a president or director of many financial and public institutions. In 1840 he aided in organizing the Providence Marine Corps of Artillery, and in 1842 commanded it during the Dorr "rebellion," protecting the State arsenal and first entering the Dorr fort at the capture of Acotes Hill. He was elected Governor of Rhode Island in 1875 and 1876 as a Republican.

Littlefield, Daniel M., manufacturer, born in North, Kingstown, R. I., Nov. 23, 1822; died in Pawtucket, R. I., May 31, 1891. He removed to Florence, Mass., and became interested in a new cotton mill in 1846 was chosen President of the Florence Sewing Machine Company in 1856, and went to Pawtucket and engaged in the manufacture of hair-cloth in 1863. In 1861-'62 he was elected to the Legislature of Massachusetts from the Northampton district; in 1878 he was an honorary commissioner from Rhode Island to the Paris Exposition, where he was appointed an American juror on fine machinery and mechanism; and in 1889 he was elected Lieutenant-Governor of Rhode Island, as a Republican.

Long, Armistead Lindsay, military officer, born in Campbell County, Va., Sept. 3, 1827; died in Charlottesville, Va., April 29, 1891. He was graduated at the United States Military Academy, and appointed a brevet 2d lieutenant of artillery in 1850; was first assigned to garrison duty at Fort Moultrie; was on frontier duty in New Mexico in 1852-'54; promoted 1st lieutenant in 1854; on garrison duty at Fort McHenry, Md., Barrancas Barracks, Fla., and Fort Wichita, Indian Territory, in 1854-'57, and in Kansas in

1857-'60. Early in 1861 he was appointed on the staff of Gen. Sumner, his father-in-law, in Washington; but on June 10 he resigned his commission. In July following he entered the Confederate service as major of artillery, and in 1862 he was promoted colonel, and appointed military secretary to Gen. Robert E. Lee. He participated in all the movements of the army under Gen. Lee, reaching the rank of brigadier-general in 1863. After the war he was engaged for three years in civil engineering, and subsequently in farming. He published "Memoirs of Gen. Robert E. Lee."

Loring, George Bailey, agriculturist, born in North Andover, Mass., Nov. 8, 1817; died in Salem, Mass., Sept. 14, 1891. He was graduated at Harvard College in 1838, and at its medical school in 1842; was surgeon of the 7th Regiment of State Militia in 1842-'44, and of the Chelsea Marine Hospital in 1848-'50; was appointed United States commissioner to revise the United States marine-hospital system in 1849; and was postmaster of Salem in 1853-'57. While employed with these duties he began a practical and scientific study of agriculture, established an experimental farm of 450 acres about equidistant from Salem, Marblehead, and Swampscott, and became widely known as a lecturer and authority on agricultural subjects. In 1866-'67 he was a member of the State House of Representatives, and in 1873-'76 was President of the State Senate. Early in life he was a Democrat in politics, and he attended the national convention in Baltimore in 1856; but he joined the Republican party in 1864, and acted with it till his death. He was a delegate to the National Republican Conventions of 1868, 1872, and 1876; was appointed Centennial commissioner from Massachusetts in 1872; and was elected to Congress from the 6th Massachusetts District in 1876, and re-elected in 1878. In 1881 President Garfield appointed him United States Commissioner of Agriculture, and he held the office till 1885. In 1889 President Harrison appointed him United States minister to Portugal, which office he resigned in 1890. Besides numerous addresses, he published "The Relations of Agriculture to the State in Time of War" (1862); "Classical Culture" (1866); "Eulogy on Louis Agassiz" (1873); "The Farmyard Club of Jotham" (1876); "The Cobden Club and the American Farmer" (1880); an "Address to the Atlanta Cotton Convention" (1881); and "A Year in Portugal, 1889-'90" (1891).

Lossing, Benson John, engraver and author, born in Beekman, Dutchess County, N. Y., Feb. 12, 1813; died near Dover Plains, in the same county, June 3, 1891. He was the son of a farmer, and was apprenticed to a watch-maker in Poughkeepsie, with whom, on the completion of his apprenticeship, he went into partnership. A little later he became one of the proprietors and editors of the Poughkeepsie "Telegraph." In 1836 they began the publication of a literary periodical called "The Casket." Mr. Lossing then learned the art of wood-engraving in New York, and in 1838-'40 was editor and illustrator of the "Family Magazine." Meanwhile he severed his business connections in Poughkeepsie and established himself as a professional engraver in New York. In 1848 he began work on his "Pictorial Field-book of the Revolution" (2 vols., 1850-'52), to make which he traveled all over that part of our country in which the War of Independence was fought, writing the history of the movements and engagements, and making accurate sketches of every object that remained at the scenes of strife, every battle-field, every famous document, and many relics preserved either in a museum or in a private house. All the sketches he engraved on wood with his own hand. This was his greatest service to the country; by it he preserved the likeness of many things that have already perished. Some years later he prepared in a similar way a "Pictorial Field-book of the War of 1812," 1869. For many years he contributed illustrated articles to "Harper's Magazine," and for the London "Art Journal" he prepared a series of articles descriptive

of the scenery, history, and legends of the Hudson river, which were published, with illustrations from his sketches, in that monthly in 1860-'61, and afterward in a volume entitled "The Hudson, from the Wilderness to the Sea" (1866). From the papers, letters, and orderly books of Gen. Philip Schuyler he prepared "The Life and Times of Philip Schuyler" (2 vols., 1860; new ed., 1880). Early in 1862 he began the compilation of a "Pictorial Field-book of the Civil War in the United States," which was issued in three illustrated volumes. In 1872-'75 he edited the "American Historical Record and Repository of Notes and Queries," published in Philadelphia. Mr. Lossing gathered a large and valuable library, and constructed a fire-proof building for it on his place at Dover Plains. He was for many years a member of the board of trustees of Vassar College. Besides the works mentioned above, he published an "Outline History of the Fine Arts" (1841); "Lives of the Presidents of the United States" (1847); "Seventeen Hundred and Seventy-six, or the War for Independence" (1847); "Life of Gen. Zachary Taylor" (1847); "Life of Gen. Winfield Scott" (1847); "The New World" (1847); "Lives of the Signers of the Declaration of Independence" (1848); an illustrated "History of the United States for Schools" (1854), which was followed by the other volumes of a graded series; "Biographies of Eminent Americans" (1855); "Mount Vernon and its Associations" (1859); "Life of Washington," illustrated (1860); "Vassar College and its Founder" (1867); "Pictorial Description of Ohio" (1869); an illustrated "Memoir of Dr. Alexander Anderson," the first engraver on wood in America, published by the New York Historical Society (1870); a "History of England" for schools (1871); a large history of the United States entitled "Our Country," with 500 illustrations by Felix O. C. Darley (3 vols., 1873); an illustrated work on the progress of industries in the United States between 1776 and 1876, entitled "The American Centenary" (1876); "Story of the United States Navy for Boys" (1880); "Cyclopædia of United States History," with 1,000 illustrations (1881); "Biography of James A. Garfield" (1881); an illustrated "History of New York City" (1884); "Mary and Martha Washington" (1886); "Two Spies: Nathan Hale and John André" (1886); and "The Empire State, a Compendious History of the Commonwealth of New York" (1887). Mr. Lossing annotated Francis Hopkinson's "Pretty Story," with a biography of the author of the allegory, which was published under the title of "The Old Farm and the New Farm" (1857). With Edwin Williams he compiled "The Statesman's Manual" (4 vols., 1858) and the "National History of the United States" (2 vols., 1858). He also edited and annotated the "Diaries of Washington" (1859), and the "Recollections and Private Memoirs of Washington," by George W. P. Custis (1860), edited the "Poems" of William Wilson, with a biography (1869), and prepared an edition of John Trumbull's "McFingal," with a life (1871).

Loughlin, John, first bishop of the Roman Catholic diocese of Brooklyn, N. Y., born in County Down, Ireland, Dec. 20, 1817; died in Brooklyn, Dec. 29, 1891. His father was a tenant farmer, who emigrated to Albany, N. Y., where the young man received his early education. He completed his classical course in a school at Chambly, near Montreal, and then went to Mount St. Mary's College, Emmetsburg, Md. On Oct. 18, 1840, he was ordained a priest for the diocese of New York. He was first sent as a missionary to Utica, where he remained two years, until the death of Bishop Dubois of New York, when Archbishop Hughes, who had been the coadjutor of Bishop Dubois, made him assistant at the cathedral. Subsequently he was promoted to pastor, and in 1849 was appointed vicar-general. Archbishop Hughes in 1852 selected Father Loughlin as his theologian to accompany him to the first plenary council, held in Baltimore. That council recommended the erection of new dioceses, including Brooklyn, and Father

Loughlin was named as bishop, and was consecrated Oct. 30, 1853, in the New York cathedral, Mgr. Cajetan Bedini, the papal nuncio, officiating. Bishop Loughlin chose as his cathedral St. James Church, on Jay Street, the oldest Catholic church in Brooklyn, and took up his residence in the present parochial house, where he lived for thirty-seven years. When he came to Brooklyn there were only 10 Catholic churches on Long Island; at his death there were 119, 70 being within the city limits. Thus he earned the title of "Church Builder." He also invited to Brooklyn several religious and charitable associations, whose advent was followed by the establishment of hospitals, homes, orphanages, convents, academies, and colleges, all directed to the education and elevation of the Catholic masses. He was a shrewd business man, and had the faculty of picking out the most valuable sites for religious institutions and purchasing the ground long in advance of the necessity for its use. In 1860 he conceived the project of building a new cathedral. A site was purchased for \$75,200, but the civil war delayed work, and it was not until 1868 that the foundation was begun, the corner-stone being laid on June 21 of that year. Bishop Loughlin made his first visit to Rome in 1869 to attend the Council of the Vatican, and was made domestic prelate to the Pope. After his return part of the new cathedral was finished and named St. John's Chapel. In 1880 he made a second journey to Rome. He was invited to attend Pope Leo's golden jubilee, but instead of going sent one of the priests of his diocese with a present consisting of an album containing photographs of all the Catholic churches and institutions in the diocese, with a detailed statement of the progress of the Church on Long Island. Adjoining the new cathedral a costly episcopal residence was erected in 1888, but it was not until May, 1890, that the bishop could be persuaded to leave his humble home in Jay Street. His golden jubilee occurred in October, 1890, the celebration lasting four days and including a public reception at the Rink and a civic parade. On this occasion he was presented with a purse of \$37,000, which he devoted to the endowment of a seminary for the education of priests. He was averse to introducing any disturbing questions in his diocese, and never interfered with the expressions by his clergy of their views on political or ethical subjects. Some of his friends in the hierarchy who disagreed with this policy suggested the appointment of a coadjutor, but Bishop Loughlin sent word to Rome that he was perfectly able to attend to all his duties. He was not an orator, but was never uninteresting in speech, and was humble-minded in spirit, shunning publicity as if it were a plague. On New Year's day, 1892, his body was transferred to the cathedral in Jay Street, and the next day was placed in a vault beneath, there to remain until the completion of the new cathedral.

Love, James M., jurist, born in Fairfax Court-house, Va., March 4, 1820; died in Keokuk, Iowa, July 3, 1891. He received a common-school education, studied law in Janesville, Ohio, was admitted to the bar in 1840, and practiced in Coshocton County till 1846. He then raised a military company for service in Mexico, and commanded it till the close of the war. In 1850 he removed to Keokuk and resumed law practice. In 1852 he served a term as State Senator. Four years later he was appointed judge of the United States District Court of Iowa, and he held the office till 1883, when the State was divided into two districts, and he was assigned to the southern. He was a Democrat in politics. It is said that in all his judicial career of more than thirty-four years but two of his decisions were reversed by the United States Supreme Court.

Lowell, Robert Traill Spence, clergyman, born in Boston, Mass., Oct. 8, 1816; died in Schenectady, N. Y., Sept. 12, 1891. His father, the Rev. Charles Lowell, was a Unitarian clergyman, and Hon. James Russell Lowell was his younger brother. He was graduated at Harvard in 1833, and studied at the Harvard Med-

leal School. In 1839 he prepared for orders under Dr. Alonzo Potter, and was invited to Bermuda by Bishop Spencer of Newfoundland. He was ordained deacon in 1842 and priest in 1843, and from 1843 to 1847 was in charge of the parish of Bay Roberts in Newfoundland. He returned to the United States in 1847, and founded Christ Church parish in Newark, N. J. From 1859 to 1869 he was rector of Christ Church, Duaneburg, N. Y., and from 1869 to 1873 was head master of St. Mark's School at Southborough, Mass. In 1873 he was appointed to the chair of Latin Language and Literature in Union College, Schenectady, which he filled for six years. He wrote much for magazines and literary journals, and was author of "The New Priest in Conception Bay" (Boston, 1858; revised edition, 1889); "Fresh Hearts that failed Three Thousand Years Ago, and Other Poems" (1860); "Antony Brade, a Story of School-boy Life" (1874); "Burgoyne's March," a poem (1877); and "A Story or Two from an Old Dutch Town" (1878). His work, both in verse and prose, evinces much individuality and the presence of very decided literary gifts as regards vigor of conception and delicacy of expression. His health, which for some time had been feeble, was not strong enough to withstand the shock of recent family bereavements, and his death followed that of his distinguished brother with but a month's interval.

Ludington, Harrison, merchant, born in Kent, Putnam County, N. Y., July 30, 1812; died in Milwaukee, Wis., June 17, 1891. He received a common-school education, began business life as a clerk, went to Milwaukee and opened a general store in 1838, and with his brothers James and Nelson engaged in the lumber business in 1842. Subsequently he withdrew from the firm and formed a partnership with D. Wells, Jr., and A. G. Van Schaick, of Chicago. The new firm bought several saw mills on Green Bay, and Mr. Ludington retained his interests in the lumber business till his death, and was active in it till within a few years. He took much pride in the development of Milwaukee, bought the first bag of wheat ever brought to market there, was an alderman and three times Mayor of the city, and was Governor of the State in 1876. He was a Republican in politics.

McAllister, Robert, military officer, born in Juniata County, Pa., June 1, 1813; died in Belvidere, N. J., Feb. 23, 1891. He spent the early part of his life in his native State, and at the beginning of the civil war he was engaged in iron mining at Oxford Furnace, N. J. On May 21, 1861, he was commissioned lieutenant-colonel of the 1st New Jersey Volunteers, and with it hastened to the defense of the national capital. On June 30, 1862, he was commissioned colonel of the 11th New Jersey Volunteers, then being recruited. This regiment was assigned to the 1st brigade, 2d division, 3d Army Corps, and Col. McAllister remained with it till June, 1864. In the second day's battle at Gettysburg he was wounded in the left leg and in the right foot, but, excepting a consequent retirement of three months, he served through the war, from the first Bull Run to the final surrender at Appomattox, and took part in forty engagements. In October, 1862, as senior colonel, he commanded the brigade to which his regiment was attached; on the consolidation of the 2d and 3d corps, and while a battle was in progress, he was placed temporarily in charge of the 2d brigade, 3d division, 2d Corps; and in June, 1864, he was given command of the 3d brigade (2d New Jersey brigade), 3d division, 2d Corps. For conspicuous gallantry at the first "bull pen," on Boynton Plank Road, Oct. 27, 1864, he was brevetted brigadier-general, and for meritorious services during the war was brevetted major-general March 13, 1865. After the war he was engaged in the mining and shipping of iron ore till age compelled his retirement.

McCurdy, Charles Johnson, jurist, born in Lyme, Conn., Dec. 7, 1797; died there, June 8, 1891. He was graduated at Yale College in 1817, studied law, and was admitted to the bar at New London in 1819.

He practiced there till 1850, and in the meantime was a member of the Connecticut House of Representatives in 1827, 1828, 1829, 1830, 1831, 1832, 1840, 1841, and 1844, and of the State Senate in 1832. He was Lieutenant-Governor in 1847-48; and United States minister to Austria in 1850-52. In 1855 he was elected a judge of the Superior Court of Connecticut; in 1863 was raised to the Supreme Court bench; and in 1867 he was retired. Judge McCurdy was a delegate to the Peace Convention in 1861, and at the time of his death was the last survivor of his class and the oldest living graduate of the college.

McDonald, Joseph Ewing, lawyer, born in Butler county, Ohio, Aug. 29, 1819; died in Indianapolis, Ind., June 21, 1891. He was removed to Indiana when seven years old, and educated by his mother till he was twelve; was then apprenticed to the saddler's trade, and worked at it for six years. He studied in Wabash College and in Asbury University; taught school, studied law, and was admitted to the bar in 1843. Soon after beginning practice, in Crawfordsville, he was elected prosecuting attorney of the county, and by re-election served till 1847. In 1848 he was elected to Congress from the 8th Indiana District as a Democrat, although the district was usually Whig; and in 1856 and 1858 he was elected Attorney-General of his State. He permanently settled in Indianapolis in 1859. In 1864 he was the unsuccessful Democratic candidate for Governor, against Oliver P. Morton. Under his direction, as chairman of the Democratic State Convention, the Democratic party in Indiana was so reorganized that it elected a majority of the Legislature in 1874, and early in 1875 he was chosen United States Senator to succeed Daniel D. Pratt, Republican. While in the Senate he served chiefly on the Committee on the Judiciary, and was a conspicuous advocate of hard money and a protective tariff. In 1876 he was appointed a member of the select committee to inquire into alleged frauds in the presidential election, and was specially charged with the investigation of the count in Louisiana. He visited that State, and made the principal argument before the electoral commission in behalf of the objectors to the count of the electoral vote of the State. He was succeeded in the United States Senate by Benjamin Harrison, and resumed his law practice.

McEnery, John, jurist, born in Virginia, in 1833; died in New Orleans, La., March 28, 1891. He was graduated at Hanover College, Madison, Ind.; was admitted to the bar in northern Louisiana, and practiced till the beginning of the civil war. He then raised the Ouachita Rifles, in the Confederate service, was commissioned lieutenant-colonel of the 4th Louisiana Regiment and, after distinguishing himself in action several times, received two severe wounds, which compelled him to retire from active service. After the war he was elected a district judge and member of the Legislature. In 1872 he received the Democratic nomination for Governor, against William Pitt Kellogg, Republican. The canvass was unusually exciting; many persons, especially colored voters, were killed; Federal troops were employed to preserve peace and allow the colored people to vote without violence or intimidation; and, although Judge McEnery received the majority of the votes that were cast, the office was awarded to Mr. Kellogg by Judge Durell's order. In 1874 Gov. Kellogg was driven from the State House by the "White League," after several men had been killed or wounded, and Judge McEnery was sent for to as-

sume the office. He and Gen. Emory, of the United States army, arrived at the State House at the same time, and Judge McEnery surrendered the office to the military, who reinstated Gov. Kellogg. Subsequently McEnery practiced law in New Orleans and Washington. He was a brother of Samuel D. McEnery, ex-Governor of Louisiana, now associate justice of the State Supreme Court.

McEntee, Jarvis, artist, born in Rondout, N. Y., July 14, 1828; died there, Jan. 27, 1891. He was educated

at the Liberal Institute, Clinton, Oneida County, N. Y., the beautiful village in which Hamilton College is situated, and which has long been noted for its schools. The principal of the institute was Dr. Thomas J. Sawyer, now Professor of Theology in Tufts College. With his wife, Caroline M. Sawyer, the author, he made a delightful home for the youths under his charge, and one of the most charming visitors there was young

McEntee, whom married Gertrude, eldest daughter of Dr. Sawyer. Mrs. McEntee was a woman of great beauty, as her portrait, painted from memory by her husband after her death, attests, and of the rarest charms of character, as the artists of the "Hudson River School," who had quarters in the familiar and famous studio building in West Tenth Street, New York city, remember. In the winters of 1850-'51 Mr. McEntee studied painting with Frederic E. Church, in New York, but he did not pursue that profession until three years later, when he opened a studio in the metropolis. His first contribution to the Academy of Design exhibition was sent in 1853, and he was elected associate of that organization in 1860, and academician one year later. In 1869, with his wife, he visited Europe, where he studied in the principal art galleries, and sketched in Italy and Switzerland. On his return he took the studio in West Tenth Street, and devoted himself to his art with an assiduity and success that soon placed him in the front rank of American painters. In delicacy and truth of delineation, in power to convey the depth of his own feeling toward Nature and to suggest her deeper charms, he is second to none in this country. Shy, sensitive, and quiet, but genial and warm-hearted, Mr. McEntee was as beloved by his friends as he was admired for his work among the larger circle of art lovers. He oftenest represented Nature in her autumn moods; but a grouping of the work of several years revealed the fact that there was no phase that he had not understood and interpreted. He made the snow of his Hudson river home as attractive as his babbling brooks, and the glimpses of ocean as strong in power to transport the lover of the sea, as his glades and leaf-strewn woods were restful and beautiful to those who knew them. He painted figure pieces somewhat in later life, and his treatment broadened with the change that a study of foreign work brought to our youthful art. Among Mr. McEntee's more important pictures are: "The Melancholy Days have come" (1860); "Indian Summer" (1861); "Late Autumn" (1863); "October Snow" (1870); "Sea from Shore" (1873); "A Song of Summer" (1876); "Virginia in 1863" (1867); "Venice" (1870); "Scribner's Mill" (1871); "Autumn," "Old Mill in Winter," "Autumn Day," "Wood Path," "Cape Ann" (1874); "Winter in the Mountains"

(1876); "Clouds" (1879); "Edge of a Wood," "November" (1880); "Kaatskill River" (1881); "Autumn Memory" (1883); "Valley of the Humboldt" (1882); "Uplands in Autumn," "Wintery River" (1883); "Yellow Autumn Woods" (1884); "Christmas Eve," "Sundown in Winter" (1885); "Ashokan—November," "Glimpse of Hunter Mountain," "Shadows of Autumn," and the "Winter Morning" (1886); "A Cliff in the Catskills" (1888). In the autumn of 1888 there was a sale in New York of seventy-five of his pictures, representing what he considered his best work for the preceding ten years, and in March, 1892, a sale of more than 100 paintings left by him.

McGowan, John, naval officer, born in Philadelphia, Pa., Dec. 3, 1805; died in Elizabeth, N. J., Jan. 18, 1891. He went to sea when thirteen years old, and was appointed a 3d lieutenant in the United States revenue marine service on May 14, 1831. On July 11, 1834, he was commissioned 2d lieutenant; on Feb. 17, 1841, 1st lieutenant; and on Dec. 3, 1852, captain. During the war with the Seminole Indians he was attached to the revenue cutter "Jackson," which vessel, in May, 1836, went to the relief of the defenseless people along the coast, and protected the citizens of St. Mark's till the arrival of a military force. He was the executive and, during a portion of the time, commanding officer of the revenue cutter "Forward" while that vessel co-operated with the navy in the war with Mexico, and was present and rendered efficient service in the attack on Tobasco and in the capture of the enemy's vessel in the river and harbor. In 1853 he resigned from the navy to take command of one of George Law's merchant vessels plying between Panama and San Francisco. On Jan. 5, 1861, he left New York city in command of the merchant steamer "Star of the West," with reinforcements and provisions for Major Anderson's garrison in Fort Sumter. He reached Charleston bar at 1.30 A. M. on the 9th, and expected to land his cargo before daybreak; but as the Confederates had removed all the harbor buoys and lights, he was obliged to grope about in the darkness till early dawn. His presence was soon reported, and armed vessels were sent from Charleston to intercept him. He continued on his course up the channel till, when opposite Fort Moultrie, he was fired on by a masked battery on Morris Island. As he was unprepared to resist, and received no support from the besieged garrison in Fort Sumter, he had to turn about and head to sea to avoid capture. This was the first shot fired in the civil war, and the failure of the attempt to relieve Fort Sumter was apparently due to the treasonable elements in President Buchanan's Cabinet. On Aug. 21, 1861, Capt. McGowan re-entered the naval service with his former rank, and he was active till his retirement in 1871. During the civil war he held several important commands, and organized and directed the famous little "Mosquito fleet" on Chesapeake Bay, for which he was highly commended. After the war and till his retirement he sustained an advisory relation to the Treasury Department.

Mackenzie, George Henry, chess player, born near Aberdeen, Scotland, March 24, 1837; died in New York city, April 13-14, 1891. He received a collegiate education, was appointed an ensign in the 60th Rifles in 1856, and served two years with his regiment at the Cape of Good Hope and in India; was promoted lieutenant, but, returning to England, sold his commission in 1861. He had gained considerable fame as a chess player, and after leaving the army he applied himself wholly to the game. For a year he played privately against some of the best players in London. In 1862 he made his first professional appearance in the London tournament, in which he defeated Herr Anderson, the Prussian champion, who had given him the odds of pawn and move, and won two games each with Medley and Deacon. In 1865 he came to New York city, joined its chess club, and won first prize in the tournaments of 1865, 1866, 1867, and 1868, also defeating Reschhelm, the Philadelphia champion, in 1866 and 1867.

He won first prize in the second American Chess Congress in Cleveland in 1871, and in the third in

Chicago in 1874, and first prize in the international tournament in New York city in 1876. In 1878 he opposed the best players of the world in the international congress of Paris and won fourth prize; in 1880 he again won first prize in the American congress; in 1882 he tied Zukertort for fourth prize in the interna-

tional congress in Vienna; and in 1883 he tied Mason and English for fifth prize in the London congress. Four years afterward he distinguished himself by winning first prize and the title of chess champion of the world in the international congress in Frankfort. In 1888 he won the second prize at Bradford, and the championship of Scotland; afterward defeated Golmay, the Cuban champion, in Havana. In the international tournament in Manchester, England, in 1890, he broke down from illness, but tied for fourth and fifth prizes. During the intervals of the national and international games he gave exhibitions in several American cities of playing blindfolded and of playing several games at once. Capt. Mackenzie was found dead in bed.

Mackenzie, Philip Wallace, inventor, born in Springfield, Mass., in 1824; died in New York city in June, 1891. He removed to New York in early life, and applied himself to improving the methods of manufacturing iron goods. In 1855 he patented the blower, cupola, and blasting furnace bearing his name for smelting iron, and followed this invention with that of the Mackenzie gas-exhauster. He spent several years in manufacturing his inventions, and in recent years occupied himself with the manufacture of gas, for which he invented many improvements.

McNeil, John, military officer, born in Halifax, Nova Scotia, Feb. 4, 1813; died in St. Louis, Mo., June 8, 1891. In early life he removed to Boston, Mass., where he learned the hatter's trade; was subsequently in business in New York city; and in 1836 went to St. Louis, and engaged in the hating business there for about twenty years. In 1844-'45 he was a member of the Missouri Legislature, and from 1855 till 1861 was President of the Pacific Insurance Company. At the beginning of the civil war he was elected colonel of the 2d regiment, United States Reserve Corps, and served for some time under Gen. Lyon. On July 17, 1861, he defeated a Confederate force under Gen. David B. Harris at Fulton, Mo.; subsequently was placed in command of the city of St. Louis by Gen. Frémont; and later was appointed colonel of the 19th Missouri Volunteers. In 1862 he was ordered to the northeastern part of the State to operate against the Confederates under Gen. Sterling Price. In October of that year a party of Confederate guerrillas captured and carried off Andrew Allsman. Col. McNeil demanded Allsman's release of the Confederate Gen. Porter, and on his refusal to surrender him, McNeil ordered the arrest and execution of ten of the most prominent Confederate sympathizing citizens of Palmyra. As soon as the Confederate Government was informed of the act, it ordered ten Federal colonels held as hostages, and demanded of the national authorities the surrender of McNeil to be tried for inhuman warfare. This demand was refused, and after a time the hostages were released. Although McNeil claimed to have acted under orders from Gens. Halleck and Schofield, he lost much prestige among Union soldiers, and was called by the

Confederates "the butcher of Palmyra." He served till the close of the war, resigning in 1865. In 1866 and 1870 he was sheriff of St. Louis County, and in 1876 was clerk of the criminal court; in 1876 was one of the Centennial commissioners from Missouri. In 1878 and 1882 was an inspector of the United States Indian Service; and at the time of his death he was superintendent of St. Louis branch post-office.

Maeder, Frederick George, actor and playwright, born in New York city, Sept. 11, 1840; died there, April 9, 1891. He received a commercial education, and for several years was a member of the boys' choir in Trinity Church. From early boyhood he had a strong desire to go upon the dramatic stage, and on leaving school and failing to become interested in business, he began studying to be an actor. When seventeen years old he secured an engagement with George Pauncefort, and made his first appearance in Portland, Me., on Nov. 8, 1858, as Bernardo in "Hamlet." In the season of 1860-'61 he played with John E. Owens's company, in the Varieties Theatre, New Orleans. About this time he began applying himself to dramatic composition, and his earliest successes were dramatizations of Dickens's "Great Expectations" and Miss Braddon's "Nobody's Daughter," both completed in 1861, and both given a good run on the stage. In 1861 he was a member of the Wallack-Davenport combination; in 1862 he leased the old Washington Theatre, in New York city, and dramatized "Les Misérables"; and soon afterward he took a panorama of the "American War" to Europe, and played in several English cities. On returning to the United States, he appeared in the "Ticket-of-leave Man" in Boston, and in 1864 played an engagement at the Broadway Theatre, New York, in "Solon Shingle." Immediately prior to his fatal illness he was traveling with McKee Rankin's party. Mr. Maeder dramatized or wrote many popular works, and played the leading characters in the most important. His best known plays include "Help," "Griffith Gaunt," "Shamus O'Brien," "Buffalo Bill," "The Runaway Wife" (in conjunction with Mr. Rankin), and "The Canuck."

Marthon, Joseph, naval officer, died in Shanghai harbor, China, Nov. 18, 1891. He entered the United States navy as a common seaman Oct. 1, 1861, was drafted to the "Pocahontas" at Hampton Roads Oct. 21, took part on her in the engagements at Port Royal, Stono Inlet, on Black river, and on blockading duty off Charleston; was appointed acting master's mate May 20, and acting ensign Oct. 26, 1863; served on the "Princess Royal" in the engagements at Donaldsonville and Fort Butler, La.; and was in charge of the howitzers in the tops of the "Hartford" during the passage of the forts at Mobile, Aug. 5, 1864, and for gallantry was promoted acting master, and was mentioned by Admiral Farragut in his report. On Dec. 18, 1868, he was promoted master; March 21, 1870, lieutenant; July 1, 1882, lieutenant-commander; and on Nov. 13, 1890, he was ordered to command the "Palos," on the China station. The "United Service Gazette," of London, in expressing regrets on account of his death, paid him this compliment: "The deceased was reckoned an energetic officer, a reputation he deserved, when we consider the late troubles on the river. The little 'Palos' was always on hand when wanted, and she was the first man-of-war to reach Wusueh after the massacre of the two Englishmen at that station."

Mathushek, Frederick, manufacturer, born in Mannheim, Germany, June 9, 1814; died in New York city, Nov. 9, 1891. Having in early youth a strong desire to learn piano making, he was apprenticed to a manufacturer in his native city, and when seventeen years old he made a tour of the principal cities in Germany, Austria, and Russia, studying the methods of foreign manufacture. He also displayed large inventive skill, and on visiting London was soon employed in the celebrated piano house of Erard. In 1849 he removed to New York city, worked for some time with John B. Dunham, in 1854

went with the Wallace Piano Company, and afterward established a factory of his own. His inventions include the first overstrung piano made in the United States, the double sounding-board piano, the lifting hammer rail for soft pedals, the mammoth grand piano for Gilmore's peace jubilee in Boston, the orchestral equalizing scale, the little Colibri which took the American Institute's highest diploma in 1864, and the equiliber system of piano-forte patented in 1879.

Maynard, Edward, inventor, born in Madison, N. J., April 26, 1813; died in Washington, D. C., May 4, 1891. He was appointed an cadet in the United States Military Academy in 1831, but, having a naturally delicate constitution, he was obliged to resign in the following year. In 1835 he was graduated in dental surgery, and, removing to Washington in 1836, he practiced there till March, 1890. He won high rank in this profession, invented many instruments now used by dentists generally, and discovered the diversity in the form, situation, and capacity of the maxillary alveolus. Emperor Nicholas I of Russia appointed him court dentist, and he was for many years Professor of Theory and Practice of Dentistry in the Baltimore College of Dental Surgery and in the dental department of the National University at Washington. It was through his inventions in ammunition and fire-arms that Dr. Maynard was most widely known. In 1845 he patented the tape system of primers, to take the place of the percussion cap; in 1851 he patented a breech-loading rifle, which subsequently bore his name, was widely used, and was the forerunner of the metallic cartridge breech-loader of to-day; in 1860 he devised the method for converting muzzle-loading muskets into breech-loading rifles; in 1868 he patented a plan for joining two rifle or shot barrels together by a device that would allow either barrel to expand or contract endwise independently of the other; and in 1886 he perfected his last invention, a contrivance for indicating the number of cartridges in the magazine of a repeating fire-arm at any time. The Maynard rifle was adopted by the United States Government, and by several foreign countries, and for his inventions in the line of fire-arms he received high honors from Prussia, Belgium, and Sweden.

Merrill, William E., military officer, born in Fort Howard, Wis., Oct. 11, 1837; died on a railroad train near Edgefield, Ill., Dec. 14, 1891. He was graduated at the United States Military Academy and appointed brevet 2d lieutenant of engineers in 1859, was promoted 2d lieutenant, Feb. 20, and 1st lieutenant, Aug. 6, 1861; captain, March 3, 1863; major, March 7, 1867; and lieutenant-colonel, Feb. 20, 1883. In the volunteer service he was colonel of the 1st United States Veteran Engineers from Aug. 30, 1864, till Sept. 26, 1865. During the civil war he was brevetted captain, April 16, 1862, for gallantry in an engagement before Yorktown; major, Sept. 19, following, for the battle of Chickamauga; and lieutenant-colonel and colonel, March 13, 1865, for the battles of Lookout Mountain and Missionary Ridge, and for those of Resaca and New Hope Church. At the time of his death he was United States engineer in charge of work on the Ohio river and navigable tributaries.

Messersmith, John S., physician, born in Lancaster, Pa., in 1810; died there Feb. 16, 1891. He was graduated at Jefferson Medical College, and was appointed an assistant surgeon in the United States navy Feb. 9, 1837. In 1839-'40 he was attached to the sloop "Fairfield," in the Brazilian squadron; in 1842-'43 to the brig "Dolphin," in the home squadron; in 1845 to the steamer "Col. Harney"; during the Mexican War to the bomb brig "Etna"; and in 1850-'54 to the store ship "Southampton," in the Pacific squadron. He was promoted surgeon, July 13, 1853; was on the steam frigate "Susquehanna," in the East India squadron, in 1855; at the Mare Island Navy Yard, Cal., in 1857-'59; on the steam sloop "San Jacinto" in 1861; and on the "Constellation," in the Mediterranean squadron, during the

civil war. In 1866 he was on duty at the Norfolk Navy Yard; in 1867-'68 at the Philadelphia Navy Yard; and in June, 1872, he was retired.

Milhan, John J., physician, born in France, Dec. 28, 1828; died in New York city, May 9, 1891. He was born during a visit of his parents to southern France. In 1850 he was graduated at the College of Physicians and Surgeons, and in 1851 was appointed an assistant surgeon in the United States army. His service till the beginning of the civil war was in California and the West, and comprised participation in the expedition against the Snake Indians in 1855, the Yakima expedition to Washington Territory, the Red River Indian campaign, the Kansas border troubles, and the Utah expedition in 1858. In 1861 he was appointed medical inspector of the Army of the Potomac; in 1862 he became medical director of the 3d Army Corps, and also of the hospital at Frederick, Md.; and in 1863-'64 he was medical director of the 5th Army Corps. In November, 1864, illness compelled him to retire from field service, and he was ordered on duty in New York city. He was medical director of the 3d military district, Department of the South, in 1867-'69, and resigned his commission in the army Oct. 1, 1876. During the war he was on duty at Yorktown, Williamsburg, Seven Pines, the seven days' peninsular fight, the second Bull Run, Gettysburg, Rappahanock station, in the Mine Run expedition, and at Spotsylvania and Petersburg. He was brevetted lieutenant-colonel for the Richmond campaign Dec. 2, 1864; colonel for gallant services during the war, March 13, 1865; and brigadier-general for special merit in alone attending the sick on Hart's Island, New York, during the cholera epidemic, Sept. 28, 1866. After the war he returned to New York city, where he gave the greater part of his attention to the estate left by his father, and to duties connected with numerous associations of which he was a member. He was one of the State commissioners of charities in 1882-'90.

Mines, John Flavel, journalist, born in Paris, France, Jan. 27, 1835; died in New York city, Nov. 5, 1891. He was a son of Flavel Scott Mines, D. D., and grandson of John Mines, D. D., and was graduated at Trinity College, Hartford, in 1854, and at Berkeley Divinity School, in 1857. Soon afterward he was ordained deacon and priest in the Protestant Episcopal Church, and held pastoral charges in Bound Brook, Conn., and in Bath, Me. In May, 1861, he became chaplain of the 2d Maine Volunteers; was subsequently commissioned colonel of the 1st Maine Volunteers, was taken prisoner and confined in Libby Prison, and, after being released on parole, went to Washington and engaged in journalism. After the war he was employed at various times on the New York "Tribune," Troy "Times," New York "Commercial Advertiser," Utica "Republican," "Frank Leslie's Illustrated Newspaper," New York "World," "Sunday Mercury," and "Evening Post." A series of sketches on old New York written by him and published under the pen-name "Felix Oldboy" attracted much attention. During the summer of 1891, he revived the "Felix Oldboy" sketches in the "Commercial Advertiser." He published "The Heroes of the Last Luster," a poem (New York, 1858), and "A Tour Around New York (1888).

Moen, Philip Louis, manufacturer, born in Wilna, N. Y., Nov. 13, 1824; died in Worcester, Mass., April 23, 1891. He became a clerk in a hardware store in New York city, whose proprietors were the selling agents for the wire manufactured by Ichabod Washburn, in Worcester. In 1846 he married a daughter of Mr. Washburn, soon afterward removed to Worcester, and in 1850 entered into partnership with his father-in-law, under the firm name of I. Washburn & Moen. In 1868 the firm name was changed to the corporate name of the Washburn & Moen Manufacturing Company, and in 1870, on the death of Mr. Washburn, Mr. Moen became president of the corporation. He was also President of the Washburn Memorial Hospital, a trustee of the Worcester Polytechnic Institute, and

a Republican presidential elector in 1884. About 1875 he became the subject of a mystery that has not yet been explained. Between that year and 1882 he paid to "Doc" Levi Wilson, in sums ranging from \$500 to \$50,000 at a time, between \$300,000 and \$400,000, and when in the latter year he stopped payments Wilson brought suit against him to recover a further sum for what he called a breach of contract. The case reached the United States court in Boston in November, 1886, and instead of giving Wilson the verdict of \$113,000 against Mr. Moen that he had expected, the jury gave Mr. Moen a verdict of \$96,522 against Wilson. Mr. Moen testified that he had been blackmailed, and that Wilson had told him he was cognizant of a crime the particulars of which he threatened to publish unless paid to keep silent. He also said the crime did not concern him personally, but he declined to repeat Wilson's story. On the other side, Wilson swore that he had never threatened to publish the story, and when pressed for the narrative he would only declare "Moen can best tell you." The case attracted wide attention, and soon after the verdict Wilson went West and dropped out of public notice.

Monroe, John Albert, civil engineer, born in Swansea, Mass., in 1837; died in Providence, R. I., June 11, 1891. He was a student in Brown University at the beginning of the civil war. Giving up his studies, he entered the national army, and won distinction in the artillery. He was chief of artillery in the divisions of Gens. McDowell and Doubleday and in the corps of Gen. Hooker; commanded for more than a year the artillery camp of instruction in Washington, commanded the artillery brigade of the Army of the Potomac, and had charge of the entire artillery force at the battle of the Mine. He received high commendation for his skill and efficiency in the orders and reports of Gen. McDowell, King, Patrick, Doubleday, Hooker, Burnside, Gibbon, and Heintzelman. After the war he became a civil engineer, and was engaged in important works. In 1879 he was appointed United States assistant engineer, under the Mississippi convention, and made hydrographic, topographical, and geodetic surveys of the Mississippi river from Cairo to Memphis. Subsequently he was employed in constructing a section of the West Shore Railroad, in which he had charge of the difficult work about Rondout; in building the water works at Bismarck, N. Dak.; and as resident engineer in charge of the construction of the Thames river bridge at New London, Conn.

Morehouse, Albert Prickett, lawyer, born in Delaware County, Ohio, July 11, 1835; died in Marysville, Mo., Sept. 23, 1891. He was brought up on a farm, received a good village-school education, began teaching when eighteen years old, removed to Missouri in 1856, and was admitted to the bar in Montgomery County, Iowa, in 1860. When the civil war broke out he became 1st lieutenant in Col. Kimball's regiment. In 1862 he entered into law partnership with Col. Amos Graham in Marysville, and in 1871 relinquished active practice. He was a delegate to the National Democratic Convention in Baltimore in 1872, and to that in St. Louis in 1876; was in the State Legislature in 1877-'78 and 1883-'84; was elected Lieutenant-Governor of Missouri on the ticket with John S. Marmaduke in 1884; and on the death of the Governor in 1887, succeeded him and held the office till January, 1889.

Morgan, George Denison, financier, born in Hartford, Conn., in 1818; died in Irvington, N. Y., June 13, 1891. In 1847 he removed to New York city and engaged in the banking business, in partnership with his cousin Edwin D. Morgan, John T. Terry, and Solon Humphreys, under the firm name of E. D. Morgan & Co. He retained his connection with the firm till about 1876, when he retired to private life. During the civil war he was appointed Government agent for purchasing vessels needed for war purposes, and, applying his business methods to this duty, he saved the Government many millions of dollars. He was

officially connected with several banking, insurance, and trust companies, and was a liberal promoter of charitable enterprises.

Morris, Ernest, explorer, born in Georgetown, Texas, July 22, 1856; died in Minnesota, April 29, 1891. While a child he removed with his parents to Indianapolis, Ind., where he received a limited education, and distinguished himself by making unique collections of natural-history specimens and becoming skilled in taxidermy. When seventeen years old he set out with two companions on his first exploring expedition, intending to make his way in a skiff to New Orleans, and thence to Florida. An accidental upsetting of the boat discouraged his companions so that they returned home, leaving him to pursue his journey alone. He reached Florida, collected many interesting specimens, and, returning to Indianapolis, sold them for more than enough to pay his expenses. For his second trip he selected South America, with the intention of exploring the Amazon. He had no knowledge of the language, did not follow the routes familiar to pleasure-seekers, and went alone. He visited many of the great lakes, gathered valuable specimens of the flora and fauna, and on his return sold his collections in Brooklyn. In 1876 he delivered the first lecture on his travels, in Indianapolis. In September of that year he set out to explore Topajes river, which flows into the Amazon, about 600 miles from the sea, with articles for trading with the natives. He returned in the spring of 1877 with several thousand dollars' worth of specimens. On June 7, 1877, in response to an invitation from the Long Island Historical Society, he delivered an impressive narrative of his journey, in Brooklyn, giving much information about sections of Brazil previously unexplored, and exhibiting the heads of ten South American Indians that had been preserved by the Mundurucu nation as trophies of war. In the autumn of 1877 he made another journey to Brazil, and while there executed commissions for naturalists, colleges, and others. On this trip he explored the region of the Rio Negro, the Tefe, and the Jefura; visited several of the upper tributaries of the Amazon; and spent considerable time in the region of the lowlands of the Rio Ampiao, and in the country bordering on the Rio Napo, in Peru. While on this trip he corresponded frequently with the New York "World" in 1879 and 1880. He became widely known as the "boy explorer" and the "boy naturalist."

Morrow, Henry A., military officer, born in Virginia, July 10, 1829; died in Hot Springs, Ark., Jan. 31, 1891. He first entered the army as a private in a Maryland regiment of infantry, which was mustered for service in the Mexican War, and served from May 18, 1846, till May 30, 1847. On Aug. 15, 1862, he was commissioned colonel of the 24th Michigan Infantry; on Aug. 1, 1864, he was brevetted brigadier-general of volunteers for gallantry in the campaign before Richmond; on March 13, 1865, he received the brevet of major-general for conspicuous gallantry and for good conduct before Petersburg; and on July 19 following he was mustered out of the volunteer service. During the civil war he commanded expeditions to Port Royal, Va., in April, and to Westmoreland Court-house, Va., in June, 1863; and took part in the battles of Fredericksburg, Fitchburg Crossing, Chancellorsville, Gettysburg (wounded), the Wilderness (wounded), Dabney's Mills, Va. (severely wounded), and before Petersburg. On the reorganization of the regular army he was appointed lieutenant-colonel 36th United States Infantry, on July 28, 1866; was brevetted colonel, March 2, 1867; was transferred to the 13th Infantry, March 15, 1869; and was promoted colonel 21st Infantry, April 27, 1879. In 1885 he commanded a brigade at Crisfield, Kansas, during the Indian hostilities. He was officially stationed at Fort Sidney, Neb., at the time of his death.

Morton, Marcus, jurist, born in Taunton, Mass., April 8, 1819; died in Andover, Mass., Feb. 16, 1891. He was graduated at Brown University in 1841, studied law two years in the Cambridge Law School, and in

the office of Sprague & Gray, in Boston; and was admitted to the bar of Suffolk County in 1841. He practiced in Boston till 1850, and then settled permanently in Andover. In 1853 he was a member of the State Constitutional Convention, and in 1858 was a member of the Massachusetts House of Representatives and chairman of the Committee on Elections. In April, 1858, he was appointed a justice of the Superior Court of Suffolk County, and in the following year, on the reorganization of the judicial system of the State, he was appointed a justice of the Superior Court. After a service of ten years he was promoted to the bench of the Supreme Court, succeeding his father, who had sat on the same bench for fifteen years. In January, 1882, on the resignation of Chief Justice Gray, Judge Morton was appointed chief justice, and he held the office till November, 1890, when failing health led him to resign.

Mowbray, George W., inventor, born in Lewes, England, in 1815; died in North Adams, Mass., June 21, 1891. He was educated for a chemist, and came to the United States in 1853. After spending five years at the California gold mines, he was employed as chemist in the Pennsylvania oil region till 1868, and then removed to North Adams. There he invented the commercial form of nitro-glycerin and superintended its manufacture and use for the construction of the Hoosac Tunnel. After the completion of the tunnel he continued the manufacture of the explosive at North Adams, and made experiments that resulted in the invention of a smokeless powder, the improvement of nitro-glycerin for general blasting, and of an improved method of insulating electric wires. For several years he had been consulting chemist of the Maxim and Nordenfeldt Arms Company of London, and since 1885 had been chemist of the Zylonite Company of North Adams.

Murdock, Samuel K., actor, born in Philadelphia, Pa., in February, 1816; died there, Dec. 15, 1891. He was a younger brother of James E. Murdock, the actor, was graduated at Jefferson Medical College, and was elected brigadier-general of Pennsylvania militia in 1849. In 1850 he went to California, and for a time practiced medicine, then became a miner, and afterward a merchant in San Francisco. While there he adopted the stage as a profession, and on Jan. 16, 1852, he made his first appearance as Pierre in "Venice Preserved," at the Jenny Lind Theatre. During Anna Bishop's operatic engagement he supported her in the German language. In 1855 he appeared as Pierre to his brother's Jaffier, at the Baltimore Museum, and on April 23 of the same year he made his first appearance in Philadelphia as St. Pierre in "The Wife," at the City Museum. He served in the national army through the civil war, then resumed his profession, and, retiring from the stage in 1867, established a school of elocution in Philadelphia.

Mulford, Prentice, journalist, born in Sag Harbor, Long Island, N. Y., in 1834; died in Sheepshead Bay, N. Y., in May, 1891. After attending the village school, he aided his father, who owned the Sag Harbor Hotel, on whose death he succeeded to the business and held it till 1853. In 1856 he shipped as a common sailor on a clipper ship bound for China, but left it on reaching San Francisco, and, after remaining there a short time, again went to sea in a whaling schooner as cook. This trip was of short duration, and, returning to California, he spent several years in placer mining in the wildest part of the gold fields. Not meeting the success he desired, he opened a school in a Tuolumne County mining camp, but in the early part of the copper excitement in Stanislaus County, in 1862-'63, he joined the throng and staked a claim in the short-lived town of Cop-peropolis. Thence he followed the rush to the Nevada silver mines, where he again failed of success, and determined to return to the Sonora region. On the way he was lost and nearly perished in the Sierra mountains. Failing in all his mining schemes, he became an itinerant comic lecturer, till he deter-

mined to try journalism. He had written for the "Union Democrat" in 1860, and now began following it more closely. In 1864 he was defeated as a candidate for the Legislature; in 1865 he became associate editor of the San Francisco "Golden Era"; in 1867-'68 he was editor of a daily paper in Stockton, and also wrote for various publications; and about 1870 he came to New York. He then made a trip on foot through the French provinces, wrote for several newspapers and magazines from the Philadelphia, Paris, and Vienna exhibitions; returned to San Francisco and edited the "Overland Monthly" and the San Francisco "Chronicle"; and about 1886 came to New York again, and held editorial places on the "Daily Graphic" and the "Star." In the last few years of his life he was interested in the study of spiritualism and metaphysics. He built himself a lonely hut on the shore of Staten Island, where he lived winter and summer; spent much time in pleasant weather in his canoe "White Crow," on Sheepshead Bay, and became editor of "The White Cross Library." He was found dead and alone in his canoe in the lower part of Sheepshead Bay on May 30, with several sheets of manuscript beside him, dated May 25, which read as if dictated by a spiritual medium, but which was claimed by his publisher as part of an expected article for the "White Cross Library." Mr. Mulford was the author of several books, including "The Swamp Angel" (New York, 1888) and "Life by Land and Sea" (1889).

Nelson, Homer Augustus, lawyer, born in Poughkeepsie, N. Y., Aug. 31, 1829; died there, April 25, 1891. He received a public-school education, was admitted to the bar in 1855, and practiced his profession till his death. He was elected county judge of Dutchess County in 1855, and served till November, 1862, when he was elected to Congress as a Democrat. He sat in that body one term, and also served as a member of the committees on Indian Affairs and on Unfinished Business. At the close of his term, during which he was known as a war Democrat, he declined a diplomatic appointment. In 1867 he was a delegate-at-large to the State Constitutional Convention, where he opposed the form adopted, which was rejected by the people; and in the same year he was elected Secretary of State of New York, serving till the close of 1871. He then declined a nomination for the State Senate, and confined himself wholly to his law practice till 1881, when he accepted a nomination for the State Senate and was elected. In 1890 he was appointed a member of the commission to report a revision of the judiciary article in the State Constitution. Judge Nelson was engaged as counsel in notable suits, including the Vassar will contest and the trial of Jacob Sharp.

Norman, Helen, singer, born in London, England, in 1858; died in New York city, Jan. 5, 1891. She studied singing with Garcia and Mori in London, made her first public appearance in one of the Schubert Society's concerts in that city, and after further study became a popular opera singer. After singing with success in the Royal Albert Hall, the London Opera House, and Covent Garden, she made a tour through the provinces with Charles Santley. She then returned to the Royal Albert Hall and appeared in "Parsifal," and at the close of that engagement made a tour with the Grand English Opera Company. After coming to the United States she sang in the concerts of the New York Symphony and Oratorio Societies, the Archer concerts, and others, and also traveled with her husband, John H. Norman, the organist, assisting him in his organ recitals with vocal selections.

Norton, Charles B., journalist, born in Hartford, Conn., July 1, 1825; died in Chicago, Ill., Jan. 29, 1891. In 1850 he came to New York city and established himself in the publishing and book-selling business, subsequently making a specialty of collecting for libraries. In 1852 he began publishing fortnightly "Norton's Literary Gazette and Publishers' Circular," and he did much to establish book-trade journalism. He removed to Clinton Hall in 1855, and

his store soon became the resort of librarians, literary people, and book collectors. He published a large number of books, including the first issue of Poole's "Index to Periodical Literature," inspired many more, and wrote several. On the formation of the Book Publishers' Association, in 1855, he became its assistant secretary and librarian, and turned over to it his periodical, the name of which was changed to "The American Publishers' Circular and Literary Gazette." In July of that year Mr. Norton relinquished the editorial management of the publication, and thereafter was more particularly employed in matters pertaining to world's fairs. He was a commissioner to the World's Fair in London in 1851; a juror in that of New York in 1853; the first to propose the Centennial Exhibition; a commissioner to the Paris Exposition in 1867; superintendent of the press bureau in the Centennial Exhibition in 1873-'76; the inspirer and manager of the foreign exhibition in Boston in 1883; and an influential official in the American Exhibition in London in 1887. A few days before his death he went to Chicago, on the invitation of the promoters of the Columbian Exposition, to aid in organizing that enterprise. He served in the national army through the civil war, and at its close he was brevetted brigadier-general. On his return from the American Exhibition in London he became editor of the "Civil Service Chronicle." Gen. Norton was the author of an official report on "Rifled Guns and Munitions of War"; a "History of the Centennial Exhibition"; and a pamphlet on "World's Fairs" (1891).

Norton, George Salmon, physician, born in Great Barrington, Mass., Dec. 8, 1851; died in New York city, Jan. 31, 1891. He was graduated at the New York Homeopathic Medical College in 1872, and had since practiced in New York city. He made a specialty of diseases of the eye, and became surgeon and a director of the New York Ophthalmic Hospital in 1875, Professor of Ophthalmology in the New York Homeopathic Medical College in 1888, President of the County Medical Society of New York in 1886, and editor of the "Journal of Ophthalmology, Otolaryngology" in 1889. Dr. Norton was a member of the 9th International Homoeopathic Medical Congress, and President of the American Homoeopathic Ophthalmological and Otolaryngological Society.

O'Beirne, Richard F., military officer, born in Canada, Oct. 25, 1833; died in New York city, Feb. 24, 1891. He was a son of Judge O'Beirne, of Detroit, Mich., who was the private secretary of Lewis Cass when the latter was Secretary of State in President Buchanan's Cabinet. Richard was appointed from civil life 1st lieutenant in the 14th United States Infantry on May 31, 1861; was promoted captain, Oct. 25 following; transferred to the 22d Infantry, Sept. 21, 1866, and to the 21st Infantry, April 19, 1869; promoted major, March 20, 1879; and lieutenant-colonel of the 15th Infantry, April 18, 1864. He served through the war with the Army of the Potomac; was brevetted major for gallantry at North Anna, Va., and lieutenant-colonel for the battle on the Weldon Railroad, both brevets dating from August, 1864; served for nine years in Oregon and Arizona, taking part in several Apache and Ute Indian campaigns; and was on Gen. Schofield's staff when the latter was superintendent of the United States Military Academy.

Olmstead, John W., clergyman, born in Saratoga County, N. Y., Nov. 13, 1816; died in Manchester, Mass., Aug. 31, 1891. He received an academic education, entered the ministry of the Baptist Church, and held pastorates of five years each in Little Falls, N. Y., and in Chelsea, Mass., and for the rest of his life, or for more than forty years, he was connected with religious journalism. His first editorial appointment was on the "Christian Reflector," and when that was consolidated with the "Christian Watchman" he remained in editorial control. Subsequently the "Christian Era" was merged in the combination, and he then became associate editor with the Rev. Franklin Johnson, D.D., and the Rev.

George C. Lorimer, D.D. In 1877 failing health forced him into a temporary retirement, and on returning to editorial work he established and conducted for three years "The Watch Tower," in New York city. In 1881 he returned to his former place on "The Watchman," and remained there till within two months of his death.

Packer, John B., lawyer, born in Sunbury, Pa., March 21, 1824; died there, July 7, 1891. He was educated for a civil engineer, and when fifteen years old was employed on the survey of the Wicomico Canal, and afterward on the State's exploration of the route between Harrisburg and Pittsburg on which the Pennsylvania Railroad was subsequently built. He was admitted to the bar in 1844, and continued in practice till his death. He was elected to the State Assembly in 1849 and 1850, after serving two years as district-attorney of his county, and was elected to Congress from the 14th Pennsylvania District as a Republican in 1868, 1870, 1872, and 1874, declining a unanimous renomination in 1876.

Paddock, Benjamin Henry, clergyman, born in Norwich, Conn., Feb. 29, 1828; died in Boston, Mass., March 9, 1891. He was graduated at Trinity College, Hartford, Conn., in 1848, and the year following taught in the Episcopal Academy in Cheshire, Conn. He then entered the General Theological Seminary in New York city, and was graduated there in 1852. While in deacon's orders he was an assistant in the Church of the Epiphany in New York city, and in 1854 he succeeded his father as rector of Trinity Church, Norwich, where he remained until called in 1860 to the rectorship of Christ Church, Detroit, Mich. In 1869 he left Detroit to become rector of Grace Church, Brooklyn, N. Y., which office he held until 1873, when he was consecrated Bishop of Massachusetts on Sept. 17, 1873, in his own church at Brooklyn. The period of his episcopate was marked by a decline of party feeling in the diocese and the substitution therefor of a spirit of harmony between opposite schools of thought, a result due in great measure to the amiable wisdom and skillful administration of Bishop Paddock.

Parrish, Joseph, physician, born in Philadelphia, Pa., Nov. 11, 1818; died in Burlington, N. J., Jan. 15, 1891. His parents were members of the Society of Friends, who educated him at home and in the schools of the Friends. He was graduated at the medical department of the University of Pennsylvania in 1844, and settled in Burlington to practice. Within a short time he established the New Jersey "Medical Reporter," which was afterward removed to Philadelphia, and was appointed physician to Burlington College and St. Mary's Hall. Within ten years he was appointed to a professorship in the Philadelphia Medical College, but he was compelled to resign at the close of his first term by failing health. Threatened with a pulmonary trouble, he sought relief in Alabama, in travel through England, France, and Germany, and finally in mountain climbing in Switzerland. The latter proved beneficial, and he prolonged his travels for the purpose of studying the hospital systems of Europe. On his return to Philadelphia he was appointed superintendent of the newly chartered State training school for idiots, now at Media. He remained here till 1863, when he accepted an office in the Sanitary Commission, and, besides other duties, edited its "Bulletins." In 1866 he organized a movement that resulted in a "society for the reformation of inebriates and for the moral and social elevation of the ignorant and neglected classes," of which he became president, and which, under his direction, established the Pennsylvania Sanitarium, also at Media. Of this institution he was appointed superintendent. In 1870 he aided in forming, and became secretary of, the American Association for the Study and Cure of Inebriety, of which Dr. Williard Parker was elected president. Two years afterward Dr. Parker resigned, and Dr. Parrish, succeeding him, held the office till his death. The success of the Media institution attracted the at-

tention of English specialists. Parliament appointed a commission to investigate the subject of inebriety and its cure, and by special invitation the American association delegated Dr. Parrish and Dr. Dodge, of Binghamton, N. Y., to explain the American system before the commission. The result of this commission's work was the establishment of the Dalrymple Home on the general American plan. In 1872, while retaining his office at Media, Dr. Parrish took temporary charge of the Maryland Inebriate Asylum, and in two years restored its effectiveness; in 1876 he resigned the superintendency of the sanitarium and opened a private home for invalids at Burlington; and in 1885 he was elected President of the New Jersey Medical Society. A "Memoir" on the life-work of Dr. Parrish was presented to the New Jersey Historical Society, by Dr. Samuel H. Pennington, on May 21, 1891.

Parton, James, author, born in Canterbury, England, Feb. 9, 1822; died in Newburyport, Mass., Oct. 17, 1891. He came to the United States when five years old, and was educated in the public schools of

New York city and in a private one at White Plains, N. Y. A legacy enabled him to continue his studies in Europe, and on his return he established a high-grade school in Philadelphia. While teaching he began literary work, and was soon afterward induced to take a place in the office of the "Home Journal," New York city, with which he was regularly connected for three years, and to which he contributed for many more. His success in literature caused him to abandon teaching. He became a regular contributor to the New York "Ledger," wrote for magazines, and published many books, notably biographies.

In January, 1856, he married Sara Payson Willis Eldredge, sister of Nathaniel P. Willis, widow of Charles H. Eldredge, who was popularly known by her pen-name "Fannie Fern." She died in October, 1872, and two years afterward he married Ellen W. Eldredge, his wife's daughter by her first husband. This marriage was shown to be illegal under the Massachusetts law, and Mr. Parton and his wife lived apart till the Legislature, on his petition, amended the law. His numerous publications include: "Life of Horace Greeley" (New York, 1855; new edition, Boston, 1885); "Humorous Poetry of the English Language, from Chaucer to Saxe" (1856); "The Life and Times of Aaron Burr" (1857; new edition, 1864); "Life of Andrew Jackson" (3 volumes, 1859-'60); "Gen. Butler in New Orleans" (1863; new edition, 1882); "Life and Times of Benjamin Franklin" (1864); "Famous Americans of Recent Times" (Boston, 1867); "The People's Book of Biography" (Hartford, 1868); "Triumphs of Enterprise, Ingenuity, and Public Spirit" (Hartford, 1871); "The Words of Washington" (1872); "Fanny Fern; a Memorial Volume" (New York, 1873); "Life of Thomas Jefferson" (Boston, 1874); "Le Parnasse Français. A Book of French Poetry from A. D. 1550 to the Present Time" (Boston, 1877); "Caricature and other Comic Art, in all Times and Many Lands" (New York, 1877); "Life of Voltaire" (Boston, 1881); "Noted Women of Europe and America" (Hartford, 1883); "Captains of Industry, or Men of Business who did Something besides making Money" (Boston, 1884); and "Captains of Industry" (second series, Boston, 1891).

Pattison, Thomas, naval officer, born in Troy, N. Y., Feb. 8, 1822; died in New Brighton, Staten Island, N. Y., Dec. 17, 1891. He entered the United States navy as a midshipman March 2, 1839; was promoted passed midshipman July 2, 1845, master Feb. 17, 1854, lieutenant Sept. 19 following, lieutenant commander July 16, 1862, commander March 3, 1865, captain July 3, 1870, commodore Dec. 11, 1877, and

rear-admiral Nov. 1, 1883; and was retired Feb. 8, 1884. During his naval career he was on sea service twenty years eleven months, on shore or other duty fourteen years six months, and was unemployed sixteen years five months. He served in the Mexican War on the steamers "Scorpion" and "Princeton," the frigates "Raritan" and "Cumberland," the ordnance ship "Electra," and the gunboat "Referee." In the civil war he was executive officer of the "Perry," which captured the Confederate privateer "Savannah"; commanded the "Philadelphia," the heaviest-armed vessel in the Potomac flotilla, in 1861; and commanded the naval station at Memphis from 1863 till March 3, 1865. He was commandant of the naval station at Port Royal, S. C., in 1878-'80, and of the navy yard at Washington, D. C., in 1880-'83.

Perry, Horace Justus, diplomatist, born in Keene, N. H., Jan. 23, 1824; died in Lisbon, Portugal, Feb. 23, 1891. He was graduated at Harvard College in 1844; became a volunteer aid on the staff of Gen. Shields in Mexico in 1847, and was secretary of the United States legation in Spain from 1849 till 1869, excepting a period of five or six years, when he was engaged in telegraph construction. While in Spain he rendered the United States most important service. In 1854 he settled satisfactorily the difficulties growing out of the "Black Warrior" affair, which had seriously threatened the peaceful relations of the two countries; and at the same time he nearly concluded a treaty for commercial reciprocity between the United States and Cuba. In 1861 he secured from the Spanish Government a proclamation of neutrality, under which the Confederate cruiser "Sumter" was allowed to remain at Cadiz only twenty-four hours, and was forced thereby to take refuge at Gibraltar, where she was effectually blockaded by American war vessels. During the civil war he discharged the duties of *chargé d'affaires*, in addition to those of secretary of legation. Mr. Perry married a daughter of Don Nicholas Coronado, of Badajoz, in 1852, a lady widely known in Spain as a lyric poet.

Phelan, James, lawyer, born in Aberdeen, Miss., Dec. 7, 1856; died in Nassau, West Indies, Jan. 30, 1891. He removed to Memphis in 1867; was educated in the Kentucky Military Institute, the University of Leipsic, and the Gymnasium of St. Thomas; received the degree of Ph. D. in 1878, and, returning to Memphis, studied law and was admitted to the bar in 1881. In 1886 and 1888 he was elected to Congress from the 10th Tennessee District as a Democrat, and he served on the committees on Commerce and on Reform in the Civil Service. He was seeking relief from consumption at the time of his death.

Piatt, Donn, journalist, born in Cincinnati, Ohio, June 29, 1819; died in Cleveland, Ohio, Nov. 12, 1891. He was educated at St. Xavier's College; studied law, and was admitted to the bar; was appointed judge of the Court of Common Pleas of Hamilton County in 1851, and at the close of his term was appointed secretary of the United States legation at Paris, under John Y. Mason, and served during the administrations of Presidents Pierce and Buchanan. On the death of Minister Mason, Mr. Piatt was *chargé d'affaires* for nearly a year. Returning to the United States, he entered the presidential canvass, and, with Robert E. Schenck, stamped Southern Illinois for Mr. Lincoln. On the appointment of Mr. Schenck to a high military command, Mr. Piatt was made a member of his staff and received a colonel's commission. During his military service he issued an order to Gen. Milroy to evacuate Winchester, Va., and fall back on Harper's Ferry, which was countermanded by Gen. Halleck, and three days afterward Gen. Milroy had to cut his way through a surrounding Confederate force, which caused a loss of 2,000 men. Later, in the absence of Gen. Schenck, Col. Piatt ordered Gen. Birney to recruit a negro brigade in Maryland. This order aroused the extreme indignation of President Lincoln, who threatened to dismiss its author from the army in disgrace. He was judge-advocate of the commission that investigated the charges

against Gen. Don Carlos Buell, and favored his acquittal. After the war Col. Piatt became Washington correspondent of the Cincinnati "Commercial," joined George Alfred Townsend in establishing the "Capital" at Washington, and in 1888 became editor of "Belford's Magazine," New York. At the time of his death he was engaged with Gen. Charles M. Cist, of Cincinnati, in preparing a life of Gen. George H. Thomas. His principal publication was "Memoirs of the Men who saved the Nation" (1887).

Pike, Albert, lawyer, born in Boston, Mass., Dec. 29, 1809; died in Washington, D. C., April 2, 1891. He

entered Harvard College in 1825, but left before completing the course to become principal of the Newburyport Grammar School. In 1831 he set out on a tedious journey to Santa Fé, New Mexico, making considerable distances on foot, and spending the greater part of the year in the trip. Dur-

ing a part of 1832 he was a clerk in Santa Fé, and in September he joined a party of 45 men in an exploring expedition down Pecos river, across the "staked plains," and to the head waters of Brazos river, reaching Fort Smith, Ark., with four companies, in December. He then taught school, became associate editor of the "Arkansas Advocate" in 1838, and its proprietor soon afterward, and sold it to engage in law practice in 1836. As a lawyer he soon became widely known, and, besides having much business as counsel for the Indians in their sale of lands to the Federal Government, he was commissioned to revise the statutes of Arkansas. During the Mexican War he commanded a squadron of Arkansas volunteer cavalry, took part in the battle of Buena Vista, and received the surrender of Mupini in 1847. At the outbreak of the civil war he was appointed Indian commissioner by the Confederate Government, negotiated treaties of alliance between the Confederacy and several powerful Indian tribes, commanded the Department of the Indian Territory and all the Indian regiments, and held the rank of brigadier-general. He resigned from the army before the close of the war, and became a judge of the Supreme Court of Arkansas. In 1866 he removed to Memphis to resume the practice of law, but in the following year bought an interest in, and took the editorship of, the "Memphis Appeal." In 1868 he sold this interest and settled in Washington, where he practiced till 1880, when he retired from professional work. Gen. Pike was a Freemason, and prepared for the Masonic order nearly 30 volumes. He published "Prose Sketches and Poems" (1834), and contributed to "Blackwood's Magazine" a series of "Hymns to the Gods."

Pineo, Peter, physician, born in Cornwallis, Nova Scotia, in 1825; died in West Somerville, Mass., Sept. 10, 1891. At the beginning of the civil war he was practicing medicine in Boston, and also was Professor of Medical Jurisprudence and Clinical Medicine at the Castleton (Vt.) Medical College. He was commissioned surgeon of the 9th Massachusetts Volunteers early in 1861, and was appointed brigade-surgeon of volunteers by President Lincoln in August. In the Virginia campaign of 1861-'62 he served on the staffs of Gen. James S. Wadsworth and Gen. Rufus King; in Gen. Pope's campaign he was on the staff of Gen. McDowell; and in the battles of Antietam and South Mountain he was medical director of the 1st Army Corps on the staff of Gen. Meade. In December, 1862, he was ordered to take charge of the Douglas General Hospital in Washington; in March, 1863, he was pro-

moted to be lieutenant-colonel and medical inspector United States army; and in 1863-'65 he inspected all the armies on the Atlantic and Gulf coasts, between Washington and Texas, and also the general hospitals at Fort Monroe, Norfolk, and Portsmouth. Dr. Pineo was assigned to duty at Fort Monroe as consulting surgeon to Jefferson Davis while he was confined there. In late years he lived in comparative retirement, though occasionally serving as an expert in medical legal cases.

Pineton, Charles Adolphe, Marquis de Chambrun and d'Aufreville, lawyer, born in Marvejols, department of Lozère, France, Aug. 10, 1831; died in New York city, Sept. 14, 1891. He was educated in the Ecole des Chartres and in the University of Paris, receiving the degree of LL. D. from the latter, and for several years was an officer of the household of the Comte de Chambord. In 1865 he was sent to the United States by Drouyn de Lhuys, then French Minister of Foreign Affairs, to study and report on the causes of the American civil war. He was cordially received by President Lincoln, who invited him to be present at the surrender of Richmond. In 1871 he was appointed legal adviser to the French legation in Washington, and he held the office at the time of his death. He was the author of "Le Régime Parlementaire" (1856); "Le Pouvoir Exécutif" (1872); and "Droits et Libertés aux Etats Unis" (1890). His wife was a granddaughter of Lafayette.

Pitkin, Perley Peabody, military officer, born in Marshfield, Vt., March 9, 1826; died in Montpelier, Vt., July 28, 1891. He received a common-school education, and spent three years in California in the early days of the gold discovery. Returning to Vermont, he settled in East Montpelier, which he represented in the Legislature in 1859 and 1860 and at the extra session at the beginning of the civil war. On June 6, 1861, he was commissioned quartermaster of the 2d Vermont Volunteers; Feb. 21, 1862, was promoted assistant quartermaster of volunteers, with the rank of captain; Aug. 2, 1864, promoted quartermaster, with the rank of colonel; and in November following he resigned from the army to become Quartermaster-General of Vermont, on election by the Legislature. While in the army he had charge of the entire wagon train of the Army of the Potomac, which would have stretched out forty miles in a straight line, during the Wilderness campaign, and was also in charge of the base of supplies for the army in Gen. Grant's campaign in 1864. The transportation, too, of many thousands of recruits and prisoners, and the care of an army of sick and wounded soldiers, were a part of his executive duties. In 1865-'69 he was re-elected Quartermaster-General of Vermont, thus holding the office during the time the State was guarding its frontier against the Fenians. In 1872 he represented Montpelier in the Legislature, and since 1865 had been engaged in manufacturing.

Plumb, Preston B., legislator, born in Delaware County, Ohio, Oct. 12, 1837; died in Washington, D. C., Dec. 20, 1891. He was brought up on a farm, received a district-school education, and was apprenticed to the printer's trade in Gambier. In 1856 he removed to Leavenworth, Kansas, and in 1857 founded the town of Emporia and established the "Emporia News." In the latter year he was secretary of the Free State Convention in Lawrence, which repudiated the Lecompton Constitution, and in 1859 he was a delegate to the Leavenworth Constitutional Convention and a signer of the Constitution there framed. He was admitted to the bar in 1861, elected to the Kansas Assembly in 1862, where he was chairman of the Judiciary Committee, and was appointed a 2d lieutenant in the 11th Kansas Infantry in August of the latter year. By promotions he served as captain, major, and lieutenant-colonel of his regiment, and was commissioned its colonel, but was not promoted in through lack of a proper officer. After the war he resumed law practice, but in 1867 reentered public life as member of the Assembly. He served there two years, in the last one as Speaker. In 1888 he

formed a law partnership with Judge Ruggles, but in 1872 he was compelled to retire from practice by failing health, and then engaged in banking. In January, 1873, he was elected President of the Emporia National Bank, and he held the office till 1877. He advocated the election of Horace Greeley in 1872, and was President of the State Republican Convention in 1876. In 1877 he was elected United States Senator, and in 1883 and 1888 was re-elected, the last time for the term ending March 3, 1895. At the time of his death he was chairman of the Committee on Public Lands and member of the standing committees on Agriculture and Forestry, on Appropriations, and on the Organization, Conduct, and Expenditures of the Executive Departments, and of the select committees on transportation and sale of meat products and on inquiry into the administrative service of the Senate. Senator Plumb was an indefatigable worker and his death was at least hastened by his intense activity.

Poillon, Richard, shipwright, born in New York city in 1818, died there, July 4, 1891. He was a member of an old French Huguenot family that had been engaged in boat building at the foot of Bridge Street for more than a century, and entered the firm in 1840. During the civil war he built several gunboats for the Federal Government, and in 1872 he built the first foreign-made naval cruisers for the Japanese Government. Since 1864 he had given special attention to the construction of yachts, his first noted success being the "Sappho," which was built on original lines, and one of his last was the ocean prize winner "Coronet," which defeated the "Dauntless."

Polk, Sarah Childress, mistress of the White House, born near Murfreesborough, Tenn., Sept. 4, 1803; died in Nashville, Tenn., Aug. 14, 1891. She was the daughter of Joel and Elizabeth Childress, was educated at the Moravian Institute, Salem, N. C., and married James Knox Polk, afterward eleventh President of the United States, in 1824. In the year following his marriage Mr. Polk was elected to Congress, and Mrs. Polk accompanied him to Washington. On March 4, 1845, on the inauguration of her husband as President, she became

mistress of the White House. It was soon observed that she had determined to manage the presidential mansion according to her own ideas of propriety and the dignity of the place. She began holding weekly receptions, but, to the surprise of those accustomed to participating in the formal life of the White House, she abolished the custom of giving refreshments to all guests and forbade dancing at the receptions, saying that neither custom comported

with the dignity of the official residence of the nation's Chief Executive. In spite of these innovations she maintained her popularity, and, being a brilliant conversationalist, she was particularly esteemed by the representatives of foreign governments. Since the death of her husband she had lived quietly in Polk Place, Nashville (see engraving), in the foreground of which is the tomb of the ex-President, and for several years had been receiving a pension of \$5,000 per annum from the Federal Government.

Pomeroy, Samuel Clarke, legislator, born in South-ampton, Mass., Jan. 3, 1816; died in Whitesville, Mass., Aug. 27, 1891. He was educated at Amherst College, and after spending several years in New York returned to Massachusetts and held various public offices, including that of member of the Assembly in 1852-'53. He was one of the organizers of the New England Emigrant Aid Society, became its financial agent, and in 1854 established a New England colony at Lawrence, Kansas, of which city he was elected mayor in 1859. Politically, he was a member of the Free State Convention at Lawrence in 1859, and was a delegate to the National Republican Conventions of 1856 and 1860. During the famine in Kansas, in 1860-'61, he was president of the relief committee. In 1861 he was elected United States Senator as a Republican, in 1867 was re-elected, and in 1873 was defeated. In the Senate he was chairman of the standing Committee on Public Lands and of the select Committee on Revision of the Rules, was a member of the Committee on Post-Offices and Post-Roads, and, from his general advocacy of subsidy measures, received the sobriquet of "Subsidy Pomeroy." While he was a candidate for a third term, charges of bribery were preferred against him in the Legislature, which sent them to the United States Senate. There a special committee reported that they were not sustained, and in the State courts a *nolle prosequi* was entered on the ground that there was not sufficient evidence to secure a conviction. But the affair cost him a second re-election, and he afterward spent the most of his time in Washington.

Potter, Platt, jurist, born in Galway, Saratoga County, N. Y., April 6, 1800; died in Schenectady, N. Y., Aug. 11, 1891. He was graduated at Schenectady Academy in 1820, and was admitted to the bar in 1824. He practiced in Minerville till 1833, then returned to Schenectady and formed a law partnership with Alonzo C. Paige, his former preceptor. In 1830 he was elected to the Assembly, from 1839 till 1847 he was district attorney of Schenectady County and, for many years prior to the abolition of the Court of Chancery, in 1847, he was also a master and examiner in that court. He was elected a justice of the New York Supreme Court in 1857, and was re-elected without opposition in 1865. During his service on this bench he was also a judge of the Court of Appeals. In 1870 he caused the arrest of Henry Ray, a member of the Assembly, for failing to answer a subpoena, for which Judge Potter was charged with a high breach of privilege and summoned before the Assembly to answer. He there defended his course with such clearness that he was acquitted of the charge and his argument was published in a pamphlet. In the same year he was elected President of the State Judicial Convention in Rochester. Judge Potter was chosen a trustee of Union College in 1865. He published "Potter's Dwaris" (1871); an enlargement of John Willard's "Equity Jurisprudence" (1875); and "Potter on Corporations" (1879).

Pottle, Emory B., lawyer, born in Naples, Ontario County, N. Y., July 4, 1815; died there, April 18, 1891. He received a common-school and academical education; studied law in Springfield, Ill., and was admitted to the bar; was elected to the New York Assembly as a Free-soil Whig in 1847, and was elected to Congress in 1856 and 1858. In the latter body he was a member of the committees on Naval Affairs and on Expenditures in the Navy Department. In 1867 he aided in preparing the wool and woolen schedule incorporated in the tariff law of that year. Mr. Pottle was for many years actively interested in the vineyard and wool-growing interests of the country, and was President of the State Grape Growers'

with the dignity of the official residence of the nation's Chief Executive. In spite of these innovations she maintained her popularity, and, being a brilliant

Society and secretary of the National Wool Growers' Association.

Pratt, Charles, philanthropist, born in Watertown, Mass., Oct. 2, 1830; died in New York city, May 4, 1891. When but ten years of age he left home to

work on a farm in his native town, where he remained about three years, attending school a few months during the winter. He then spent a year in Boston as clerk in a grocery, at the end of which time he began to learn the machinist's trade, which he afterward followed in Newton. At the age of eighteen he entered Wesleyan Academy, Wilbraham. Here he boarded himself, struggling in every way to get an edu-

cation. The year spent here completed his school life. On leaving the academy he entered the employ of a paint and oil firm in Boston, and while here he became much interested in the Mercantile Library; and his connection with this, and later with the Mercantile Library in New York, had a marked influence upon him. In 1851 he went to New York as clerk for Messrs. Schenck & Downing, who were in the oil, paint, and glass business, and for twenty-five years he continued at the same place, but not in the capacity of clerk, for in 1854 he, with two others, bought the paint and oil part of the concern. In 1867 his firm was dissolved, the oil portion of the business coming into the hands of Charles Pratt & Co. Mr. Pratt was among the first to perceive the possibilities of the petroleum trade when it began to be developed in the Pennsylvania oil fields in 1860, and he early devoted himself to the refining of the crude product, endeavoring to put upon the market the best grade of oil; to this he attached his own name, and Pratt's astral oil became known the world over. He was also an officer of the Standard Oil Company, and was interested in many other business enterprises. As his fortune increased, his sense of responsibility for the use of his riches increased also, and he gave liberally and discriminatingly to religious, educational, and charitable causes, not only in Brooklyn, which was for many years his home, but throughout the country. He contributed nearly half the cost of the Emmanuel Baptist Church of Brooklyn, of which he was a member. Although denied the advantages of extended school education, he appreciated keenly its importance, and was a life-long friend of education. For nearly twenty-five years he was a trustee, and during most of this period President of the Board of Trustees of the Adelphi Academy, Brooklyn, contributing at different times \$200,000 for its use. But while greatly interested in existing institutions, he came to feel that they did not meet the requirements of that large class of young people who wish to fit themselves for usefulness among the world's workers. Accordingly, after mature thought and thorough study of schools at home and abroad, he determined to establish an institution that should embody his ideas, and Pratt Institute—by which its founder will always be best known to the world—came into existence. The charter for this was granted in 1886, and in the autumn of 1887 the buildings were so far completed that class work was begun. As Mr. Pratt incorporated into the institute so much of himself, a brief statement of its aims and scope forms an essential part of a sketch of his life. The institute is founded upon an appreciation of the dignity and value of skilled manual labor, and aims to give its students harmonious and complete development by

the training of eye, hand, and mind. The work of the institute is done in the following departments: The library, covering the general field of literature, though especially strong in art, scientific, and technical books which are of direct use in the various departments; the privileges of the library are free to all residents of Brooklyn. The technical high-school department giving a high-school or academic education, which is made to include drawing and graded courses in manual work. The art department, with classes in free-hand, mechanical, and architectural drawing, design, clay modeling, wood carving, life work; also classes for the training of teachers. The department of domestic science, giving instruction in sewing, dress-making, millinery, hygiene, and home nursing, cooking, laundering, household economy, as well as special instruction for those wishing to become teachers of cooking. The department of commerce, which includes phonography, type-writing, arithmetic, book-keeping, English, Spanish, commercial geography, and commercial law. The department of mechanic arts, offering courses in carpentry, wood turning, pattern making, metal spinning, foundry practice, forging, machine-shop work, plastering, plumbing, painting, electrical construction, steam, strength of materials, etc. The music department, aiming to give to all classes of people, through the medium of the tonic sol-fa notation, ability to sing correctly and understandingly. The technical museum, containing choice collections of pottery, glassware, and textile fabrics, also many collections of objects arranged to show the steps in the process of manufacture from the crude material to the finished product. The Thrift, combining the features of an institution of saving and of a building-and-loan association. Diverse as the work of these departments appears, a single purpose pervades them all—to fit those who avail themselves of the opportunities offered to become self-respecting, honest, thrifty, and intelligent citizens. The institute began its work in the autumn of 1887 with a single class of twelve students; at the time of the founder's death about 3,000 were enrolled, not including the several thousands who were members of the library. In addition to the ample buildings with their splendid equipment, and the grounds, Mr. Pratt gave to the institute a large endowment in the shape of "the Astral," an enormous model tenement house, and other buildings, the income from which is to be used for the benefit of the school, and at his death he left a further endowment of \$2,000,000. Mr. Pratt, although emphatically a public-spirited citizen, declined to hold public office. He was a member of numerous clubs and other organizations, spending, however, only so much time with them as was necessary for a proper discharge of his duties, preferring that home life in which he was especially happy. He was twice married, leaving at his death a widow, two daughters, and six sons. The foundation of his large fortune—estimated at \$20,000,000—was laid while he was young, in the honesty of purpose, frugality, fidelity to trusts, and untiring energy that always characterized him as much as did his kindness and interest in others' welfare. The sentiment that he uttered at the Founder's Day celebration of Pratt Institute, a few months before his death, "The giving that counts is the giving of one's self," well expressed one of the controlling beliefs of his life.

Pratt, Thomas Tart, physician, born in Mobile, Ala., in 1839; died in London, England, Aug. 29, 1891. He received his medical education in New York city, served with the Confederate army during the civil war, and after the war settled in Paris and became assistant to Dr. James Marion Sims, whose daughter he subsequently married. On the death of Dr. Sims he took sole charge of his practice. During the Franco-German War he was first assistant surgeon of the American Ambulance Corps, and for his service to the wounded of both armies he was decorated with the cross of the Legion of Honor by President Thiers and with the Iron Cross by Emperor William. He

was one of the organizers of the Washington Club in Paris, composed chiefly of Americans.

Preston, Thomas Scott, a Roman Catholic prelate, born in Hartford, Conn., July 23, 1824; died in New York city, Nov. 4, 1891. His parents were Episcopalians, and he inherited religious tendencies that were strengthened by education. He was graduated at Washington (now Trinity) College, Hartford, in 1845. He determined to enter the ministry, and, the more fully to devote himself to religious work, decided never to marry. Naturally a ritualist, he adopted the high-church principles of the English Tractarians. In 1843 he entered the Protestant Episcopal Theological Seminary in New York, where he was graduated in 1846, and was ordained deacon. He was first assigned to Trinity Church, and afterward to the Church of the Annunciation in 14th Street, and the Church of the Holy Innocents at West Point. Bishop De Lancey, of Western New York, ordained him priest. He was next called to be assistant rector of St. Luke's Church, New York city, of which Dr. John Murray Forbes was rector, and remained there two years. Doubts as to the legitimate succession of the Episcopalian hierarchy led him to the Catholic Church. Wishing to enter the priesthood, he was sent by Archbishop Hughes to St. Joseph's Seminary, Fordham, to complete his studies, and was ordained priest at St. Patrick's Cathedral, New York, Nov. 16, 1850. He acted for a short time as assistant at the cathedral, and then took charge of the mission at Yonkers, where he remained two years. In 1853 the dioceses of Brooklyn and Newark were erected, and Dr. Loughlin was consecrated bishop of the former and Father Bayley of the latter. This left the New York diocese without a chancellor and Archbishop Hughes without a secretary, and Father Preston was recalled from Yonkers to take these places. Dr. Forbes, who had been converted to Catholicism and ordained priest, and was then pastor of St. Ann's, Church, in 1861 returned to the Episcopal Church, and Father Preston was appointed to the vacant rectorship of St. Ann's, which he held until his death. The church, which was then in 8th Street, becoming too small for the wants of the congregation, he purchased a Jewish synagogue in 12th Street, and thither the congregation removed, the new church being consecrated on New Year's day, 1871. On the death of Vicar-General Starrs in 1873, Father Preston had part of the duties of vicar-general added to those of the chancellorship. He was a firm supporter of the parochial-school system, believing that the education of the young should devolve upon the Church, and to exemplify his belief he built a commodious school-house on 11th Street. Seton Hall College, in 1880, conferred upon him the degree of S. T. D., and Pope Leo XIII created him a monsignor, Dec. 13, 1881. Monsignor Preston vigorously opposed the land and labor movement of Henry George in 1886, and declared the principles of the Labor party to be unsound and opposed to Catholic belief. When Dr. Edward McGlynn espoused the cause of Henry George, Monsignor Preston was one of the first to move against that priest, and, by representing Mr. George's doctrines as an attack on the rights of property, he did much to procure the defeat of the latter and the excommunication of Dr. McGlynn. Monsignor Preston was created protonotary apostolic Aug. 21, 1888, which gave him the title of right reverend. He was an ardent advocate of the temporal power of the Pope, and wrote many controversial and devotional works.

Prime, Edward Dorr Griffin, clergyman, born in Cambridge, N. Y., Nov. 2, 1814; died in New York city, April 7, 1891. He was a son of the Rev. Nathaniel S. Prime, and a brother of the Rev. Samuel Irenæus Prime, and was graduated at Union College in 1832 and at Princeton Theological Seminary in 1838. In 1839-'51 he was pastor of a Presbyterian church in Scotchtown, N. Y.; in 1852 became pastor of the 86th Street Church in New York city; in 1853-'54 was editorially connected with the New York "Ob-

server"; in 1854-'55 was chaplain of the American embassy in Rome, Italy; and subsequently was an editor on the "Observer" till the death of his brother in 1885. He received his degree from Jefferson College, Canonsburg, Pa., in 1857. Besides his editorial and special writings he had published "Around the World" (New York, 1872); "Forty Years in the Turkish Empire," (1875; 6th ed 1883); "Calvinism and Missions," "Civil and Religious Liberty in Turkey," and "Notes, Genealogical, Biographical, and Bibliographical of the Prime Family" (1888).

Quinby, Isaac Ferdinand, soldier and educator, born near Morristown, N. J., Jan. 29, 1821; died in Rochester, N. Y., Sept. 18, 1891. He was graduated at West Point in 1843, standing sixth in his class on the

general score, and first in engineering. Ulysses S. Grant was his classmate. He was appointed brevet 2d lieutenant of artillery, and served in garrison at Fort Mifflin, Pa., in 1843-'44. He was an instructor at West Point in 1845-'47, and in 1847-'48 served with the army in Mexico. He was next in garrison at Fort Monroe and at Fort Adams, R. I., as quartermaster, as adjutant, and as assistant adjutant-general, with the rank of 1st lieutenant. In March, 1852, he resigned his commission, and became Professor of Mathematics in the newly founded University of Rochester, N. Y. At the beginning of the civil war, in the spring of 1861, he accepted the colonelcy of the 13th New York Infantry (a Rochester regiment), and with it passed through Baltimore a little while after the bloody attack on the 6th Massachusetts Regiment in that city. Col. Quinby ordered the muskets to be loaded before the men left the cars, and immediately on alighting the first and last companies were thrown across the street from curb to curb, with the other companies by fours between, and in this order it crossed the city, defying molestation from the mob. The same soldierly precaution might have saved the lives that were lost by the mismanagement of the 6th Massachusetts. Col. Quinby led his regiment gallantly at the battle of Bull Run, where it formed a part of Sherman's brigade; but his resignation two weeks later was one of the results of the demoralization that had lost the battle. He returned to his professorship, and retained it until the spring of 1862, when, on March 17, he was commissioned brigadier-general of volunteers. This appointment is said to have followed from Gen. Grant's inquiry where he was, and why so valuable an officer was allowed to remain uncommissioned. How well, on the other hand, Quinby understood Grant, is shown by an incident that took place between the capture of Fort Henry and that of Fort Donelson. A group of college boys were discuss-

ing the news, when one exclaimed: "That amounts to nothing; he has only driven the Confederates out of Fort Henry." At that moment Prof. Quinby came along, and said: "Don't be impatient, young gentlemen. I know that Grant; he is a determined fellow, and will never let go till he gets them." A few days later came news of the unconditional surrender of Fort Donelson with 14,000 men, which made Grant famous. In April Gen. Quinby was assigned to the command at Columbus, Ky. In October, 1862, he was relieved, to take command of the 7th division of the Army of the Tennessee. The division was sent to take part in the movement to turn the Confederate right flank at Vicksburg by Yazoo pass, the Coldwater, Tallahatchie, and Yazoo rivers. Amid great difficulties Gen. Quinby pushed on to Fort Pemberton, where he arrived on March 23. Finding no ground suitable for camping or moving a large body of troops, and the fire of the small gunboats being ineffectual, he conceived the idea of going around to the east side of Fort Pemberton, crossing Yallahusha river on a pontoon bridge, cutting the communications of the fort and compelling its surrender; but he also constructed works for a direct attack, and sent back to Helena for heavy guns. The boat that carried them brought orders from Gen. Grant to abandon the movement by Yazoo pass, and Gen. Quinby withdrew his force from before Fort Pemberton on April 5. The fatigues and anxieties of this expedition in a malarious region brought on a severe illness, and he was ordered home on sick-leave May 1, 1863. But learning, a few days after reaching home, the progress of Grant's movement to the rear of Vicksburg, he hastened back, assuming command of his division on the 17th, and taking part in the assault of the 19th, and the subsequent movements. On June 5 illness again rendered him unfit for duty in the field, and he went to the North under Grant's orders, remaining in Rochester until July 1. He then commanded the rendezvous at Elmira till Dec. 31, 1863, when, convinced that he would not again be able to go to the front, he resigned his commission and resumed his chair in the university. In May, 1869, he was appointed United States marshal for the Northern District of New York, and he held that office during Grant's two presidential terms, holding his professorship also till September, 1884. In 1886-'90 he was city surveyor of Rochester. He was a trustee of the Soldiers' Home at Bath, N. Y., and vice-president of the board from the foundation of the institution, in 1879, till his resignation, in 1886. In addition to his official duties, he was frequently employed as a consulting engineer. Gen. Quinby married Elizabeth G. Gardner, daughter of Gen. John L. Gardner, U. S. A., and she and nine children survive him. He revised and rewrote several of the works in the Robinson course of mathematics, and the treatise on the calculus is wholly his.

Redpath, James, journalist, born in Berwick-on-Tweed, England, Aug. 14, 1833; died in New York city, Feb. 10, 1891. He received a common-school education, removed with his parents to Detroit, Mich., in 1848, and became connected with the New York "Tribune" in 1852. He soon imbibed the spirit of the antislavery agitation, and in 1855 went to Kansas, where he took part in the Free-soil movement, and corresponded regularly with several Northern newspapers. After two years' residence in Kansas he determined to make a personal investigation of slavery in the Southern States, and in doing so he associated as closely as possible with the actual daily life of the slaves. This tour made him more than ever an abolitionist, and prompted him to join with others in organizing a scheme for the colonization of slaves in Hayti. He made two trips to Hayti to facilitate this object, and was appointed by the Haytian Government its emigration agent in the United States, and also its consul at Philadelphia. The breaking out of the civil war prevented the consummation of his purpose. He was one of the earliest war correspondents at the front, and remained in the field, principally

with the armies of Gen. Sherman and Thomas, till the close of the war. He then, under official appointment, settled in Charleston, S. C., as superintendent of education, and reorganized the educational system of the city and established schools for colored youth. In 1868 he removed to Boston and established the Lyceum Bureau, through the agency of which he introduced several well-known lecturers and readers to the American public. After several successful seasons he sold his business to Major J. B. Pond, by whom it is still continued. In 1872 he made a tour of the South in advocacy of the re-election of President Grant, and in 1876 became secretary of the Teller Senate Committee on Investigation of Alleged Election Frauds in Louisiana, Mississippi, and other Southern States. In 1877 he established a newspaper syndicate in Washington, which proved a failure, after which he resumed editorial work on the New York "Tribune," by which he was sent to Ireland to report on the famine of 1879-'80. While in Ireland he became strongly attached to the Land League party and to the principle of home rule, and after a short visit to the United States he returned to aid the promoters of the Irish movement. His efforts with voice and pen aided in swelling materially the famine relief fund collected in the United States. Soon after his return he established a weekly newspaper in New York city, which lived two years. He then was employed on the "North American Review," and became an advocate of Henry George's land theories. In 1887 he had a stroke of paralysis, but he continued his literary work till the accident that caused his death. He made another trip to Ireland in 1888, and afterward assisted Jefferson Davis in preparing his history of the Southern Confederacy, and Mrs. Davis in compiling the memoirs of her husband. Mr. Redpath published "Hand-book to Kansas" (New York, 1859); "The Roving Editor, or Talks with Slaves in the Southern States" (1859); "Echoes of Harper's Ferry" (Boston, 1860); "Southern Notes" (1860); "Guide to Hayti" (1860); "The John Brown Invasion" (1860); "The Public Life of Capt. John Brown" (1860); "John Brown, the Hero" (London, 1862); and "Talks about Ireland" (New York, 1881).

Elco, Harvey, lawyer, born in Conway, Mass., June 11, 1800; died in Cleveland, Ohio, Nov. 7, 1891. He was graduated at Williams College in 1824; removed to Cleveland, and opened a classical school in the old St. Clair Academy the same year; studied law, and was admitted to the bar in 1826; and purchased the newspaper now known as the "Cleveland Plain-dealer" in 1828. After spending two years in editorial work, he was elected to the Ohio Assembly, and soon afterward he was appointed agent for the sale of the Western Reserve school lands, of 50,000 acres, in the Virginia military district. In three years he sold all the lands and turned nearly \$150,000 into the State treasury. In 1833 he was appointed clerk of the Common Pleas and the Supreme Courts in Cleveland, and he held the office for seven years; in 1834 and 1836 he was an unsuccessful Democratic candidate for Congress; in 1851 he was elected to the State Senate, where he advocated the reorganization of the common-school system of Ohio and the establishment of school libraries; and in 1867 he planned and erected at his own expense a beautiful marble monument in Mission Park, Williamstown, Mass., commemorative of American foreign missions. He published "Mount Vernon, and other Poems" (1858; 4th edition, 1864); "Nature and Culture" (Boston, 1875); "Pioneers of the Western Reserve" (1882); "Select Poems" (1885); and "Sketches of Western Life" (1888).

Richardson, Charles A., editor, born in Franklin, Mass., Oct. 9, 1829; died in Boston, Mass., Jan. 18, 1891. He was educated at the State Normal School at Westfield, and, after teaching for several years, became managing editor of the "Congregationalist" in 1856, and held the office till his death. He was also Vice-President of the Congregational Club, a director of the Congregational Association, and a

member of various committees engaged in religious and missionary work.

Ritter, Frederic Louis, musical composer, born in Strasburg, Germany, in 1834; died in Antwerp, Germany, July 6, 1891. He was descended from a Spanish family named Cabellero; first studied music with Hauser and Hans Schletterer, then with George Kastner, in Paris, and afterward with masters in Germany; and in 1852 became Professor of Music in the Protestant Seminary of Fenestrange, Lorraine. Thence he went to Bordeaux, where he conducted a series of concerts. In 1856 he removed to Cincinnati, where he organized the Cecillia (choral) and Philharmonic (orchestral) societies, produced works new to this country, and did much to promote the cause of music in the West. He became conductor of the Sacred Harmonic Society and of the Arion Singing Society in New York in 1861, and organized and conducted at Steinway Hall the first purely musical concert held in New York city, in 1867. He was appointed director of music at Vassar College in 1867, and held the office till his death, resigning his offices in New York city and removing to Poughkeepsie in 1874. In 1878 he received the degree of Mus. Doc. from the University of the City of New York. His publications and compositions include: "A History of Music in the Form of Lectures" (1870-'74); "Music in England" (1883); "Music in America" (1883); "Manual of Musical History from the Epoch of Ancient Greece to our Present Time" (1886); "Musical Dictation" (1888); "Practical Method for the Instruction of Chorus Classes"; "The Realm of Tones," edited (1883); "The Woman's College Hymnal," compiled with the Rev. J. Ryland Kendrick; and sacred music compositions, the 4th Psalm, the 23d and 95th Psalms for female voices, "O Salutaris," and an "Ave Maria." He also composed the music for more than 100 German songs; many hymns and songs for children; and instrumental works, as symphonies, overtures, septet for flute, horn, and string quintet, string quartet, and music for the piano and organ.

Robinson, Lucius, lawyer, born in Windham, Greene County, N. Y., Nov. 4, 1810; died in Elmira, N. Y., March 23, 1891. He was a lineal descendant of John Robinson, the celebrated Puritan clergyman; was educated at Delaware Academy, Delhi, N. Y.; and was admitted to the bar in 1832. He settled in Catskill to practice, was district attorney of Greene County in 1837-'40, when he removed to Elmira and resumed practice. He was appointed a master in chancery in 1843, and served continuously till the abolition of that court in 1847. Almost immediately after retiring from this court he received the Democratic nomination for judge of the Superior Court, but was defeated. He was employed chiefly with referee cases till 1855, and then retired to a farm in Chemung County for rest. In 1859 he was elected to the State Assembly as an independent candidate, by a combination of Republicans and Democrats, and he was re-elected in the following year. In 1861 he was defeated as candidate for Speaker, but the same year he was elected Comptroller of the State by the largest majority that had ever been given a candidate for a State office in New York (108,201). In the convention of 1863 he was a candidate for renomination, but the party managers chose another, and when this nominee declined, Mr. Robinson was nominated by the State committee, and was again elected by a majority greater than that of the general ticket. He was a candidate for a third election in 1865, but his conservative administration and his opposition to refunding plans caused his defeat. During the civil war period he had acted with, and been the candidate of, the Republican party, but at its close he returned to the Democratic party, and as its candidate for Comptroller was again defeated. In 1870 he was defeated for Congress; in 1875 was re-elected Comptroller; and in 1876 he was elected Governor. Tammany Hall opposed his candidacy for re-election in 1879, and he was defeated. During his administration as Governor he was vigilant in regard to public ex-

penditures, freely used the veto power against special legislation, and recognized and promoted the doctrine of home rule for the large cities. His personal integrity was beyond question.

Robinson, Moncure, civil engineer, born in Richmond, Va., in 1802; died in Philadelphia, Pa., Nov. 10, 1891. He was educated at William and Mary College, and began his professional work when sixteen years old in connection with a topographical survey of the State from Richmond to the Ohio river. While engaged in this work he made detailed reports on the coal fields of West Virginia, and made an independent expedition into the northwestern part of the State. In 1821 he critically examined the Erie Canal, and the same year was asked to superintend the extension of the James River Canal to Covington. But he had become convinced of the general superiority of railroads over canals, and urged the building of a railroad instead, but as his views were not entertained he declined the undertaking. In 1823 he went to Europe; studied civil engineering and important public works in France, England, Wales, and Holland, and, becoming acquainted with George Stephenson, then building the Liverpool and Manchester Railroad, received ample confirmation of his own views on the relative merits of railroads and canals. He returned home in 1827, and in the following year began surveys for the Pottsville and Danville Railroad, designed to develop the anthracite coal fields of Pennsylvania. Afterward he made a survey and plans for the Alleghany Portage Railroad, which, in competition with the plans of other engineers, were finally adopted. His plan involved a tunnel one mile long and the transportation of loaded boats from the canal at Hollidaysburg by rail over the Alleghany mountain, and their launching again into the canal basin at Johnstown, to proceed thence to Pittsburgh. In 1830 he built a thirteen-mile railroad in Virginia to reach the coal fields, the novelty of which consisted of an inclined plane or gravity road, now a common affair. In the following year he was engaged in the construction of the Petersburg and Roanoke and the Richmond and Petersburg railroads, and for the latter he built the long bridge over James river at Richmond. Next he undertook the construction of the Richmond and Fredericksburg and the Winchester and Potomac railroads. In 1834 he began the principal work of his life, the building of the Philadelphia and Reading Railroad. In this work he was not only successful as an engineer but also as a financier, for on him was placed the duty of securing in England a loan with which to complete the road. Subsequently he invented and built the Gowan and Marx engine, and for the Federal Government selected the Wallabout basin as the best site in New York harbor for a great dry-dock. He retired from active field work in 1847, but till the time of his death he was frequently consulted on large engineering works.

Rouckendorf, William, naval officer, born in Philadelphia, Pa., Nov. 9, 1812; died in New York city, Nov. 27, 1891. He was appointed a midshipman in the United States navy, Feb. 17, 1832; was promoted passed midshipman, June 23, 1838; lieutenant, June 28, 1843; commander, June 29, 1861; captain, Sept. 27, 1866; commodore, Feb. 12, 1874; and was retired Nov. 9, 1874. During his naval career he was on sea service twenty-two years eight months; on shore or other duty, ten years ten months; and was unemployed twenty-five years four months. In 1845 he was bearer of dispatches from the Navy Department to the commander-in-chief of the Pacific squadron, with which he served through the Mexican War; in 1847 was on the "Savannah" at the capture of Monterey, and in 1859 commanded the steamer "M. W. Chapin" in the Paraguay expedition. In the civil war he took part in the fight with the "Merrimac" as commander of the "San Jacinto" in the attack on Sewell's Point, and in the capture of Norfolk; was employed in searching for privateers in 1863; and commanded the "Monadnock" in the James river operations, and made a cruise in search of the

"Stonewall" in 1864. In 1870-'72 he was in charge of the ironclads at New Orleans.

Royce, Homer Elihu, jurist, born in Berkshire, Vt., June 14, 1820; died in St. Albans, Vt., April 24, 1891. He received an academical education; was admitted to the bar in 1844; was prosecuting attorney for the State in 1846-'47; and was State Senator in 1849-'51. In 1856 and 1858 he was elected to Congress, where he served as a member of the Committee on Foreign Affairs; and in 1870 he was chosen an associate justice of the Supreme Court of Vermont. He held this office till 1882, when he was appointed chief justice, and served as such till impaired health caused him to resign in 1890.

Safford, Mary Jane, physician, born in Vermont, about 1840; died in Tarpon Springs, Fla., Dec. 8, 1891. For several years she resided with her brother in Cairo, Ill., where she established a free school and taught till the beginning of the civil war. Through personal acquaintance with President Lincoln and Gen. Grant she secured permission to go to the seat of war as soon as hostilities began, and was credited with being the first woman to administer relief to the wounded on the field of battle in the war. Before its close her strength gave way and she went to Europe for rest. On her return she spent three years studying medicine in New York city, and was graduated at the College and Hospital for Women. Receiving permission to enter the medical department of the University of Vienna—the first ever granted to a woman—she spent nearly three years studying there and in various hospitals in Europe. She then settled in Chicago to practice, but soon removed to Boston. In 1873, on the establishment of the Boston University School of Medicine, she was appointed a Professor of Diseases of Women, and held the chair till 1888, when she settled in Tarpon Springs.

St. John, Charles, merchant, born in Mount Hope, Orange County, N. Y., Oct. 8, 1818; died in Port Jervis, N. Y., July 6, 1891. He received a common-school education, engaged in lumbering on Delaware river, subsequently carried on a general mercantile business, and afterward established a lumbering plant on Susquehanna river near Williamsport, Pa., and became the second largest individual operator in lumber in the world. In 1870 and 1872 he was elected to Congress from the 12th New York District as a Republican, and he served on the committees on Public Lands and on Expenditures in the State Department. In 1880 he was a presidential elector.

Sands, Samuel, publisher, born in Annapolis, Md., in 1800; died in Baltimore, Md., July 28, 1891. In 1811 he was apprenticed to the printer's trade, and in 1814, while working in the office of the Baltimore "American," he put into type, fresh from the author's hands, the song of "The Star-spangled Banner." When sixteen years old he was foreman of the "American's" composing-room, and he remained there till he went into business for himself as publisher of "The American Farmer" in 1819, one of the first agricultural papers in the United States. He also established "The Morning Chronicle," a daily newspaper; in 1836 published "The Freeman's Banner," in which he advocated the election to the presidency of William Henry Harrison; in 1869 established "The Real Estate Register," and in 1872 "The Rural Register." He had been a staunch Whig, a war Democrat, and a zealous Republican. With his son, Samuel B. Sands, he remained an editor and publisher of "The American Farmer" till the time of his death.

Sanford, Henry Shelton, diplomatist, born in Woodbury, Conn., June 15, 1823; died in Healing Springs, Va., May 21, 1891. He received a partial collegiate education in the United States, and studied at Heidelberg University; first entered the United States diplomatic service in 1847 as an *attaché* to the legation at St. Petersburg, under Ralph J. Ingersoll; was acting secretary of legation in 1848 at Frankfurt under Andrew J. Donelson, and was secretary of legation at Paris from 1849 till 1854. In 1861 he was ap-

pointed minister to Belgium, where he remained eight years, became an intimate acquaintance of the King, and rendered such important service to the Federal Government during the civil war that Secretary Seward pronounced him "the minister of the United States in Europe." President Johnson nominated him for a second term in Belgium, President Grant for the Spanish mission, and President Hayes renewed the nomination for Belgium, but the Senate rejected him each time. He negotiated the first postal convention with France, and the celebrated Scheldt treaty of commerce and navigation; founded the city of Sanford, Fla., in 1870; was United States commissioner on the Congo River Colony in 1883, and delegate to the International Congo Conference in 1885; and was a delegate to the Antislavery Conference at Brussels in 1889.

Sawyer, Charles Carroll, song writer, born in Mystic, Conn., in 1832; died in Brooklyn, N. Y., Oct. 3, 1891. He accompanied his parents to New York city in boyhood; began writing sonnets when twelve years old, and during the civil war composed many songs, which, from the absence of sectional sentiments, became very popular among the soldiers of both armies. His best known songs are "When this Cruel War is over," "Who will care for Mother now?" and "Mother would comfort me."

Sawyer, Frederick Adolphus, Senator, born in Bolton, Mass., Dec. 12, 1822; died in Sewanee, Tenn., July 31, 1891. He was graduated at Harvard College in 1844, taught for several years in Maine, New Hampshire, and Massachusetts, and in 1859 took charge of the Normal School in Charleston, S. C. In 1864 he and his family were allowed to pass through the lines and return North, and the same year he took the stump in New England in advocacy of President Lincoln's re-election. He returned to Charleston in 1865, and became active in advancing reconstruction measures. In May of that year he was appointed collector of internal revenue in the 2d South Carolina District. He was elected to the State Constitutional Convention under the reconstruction acts of Congress, but declined to serve, and was elected United States Senator in 1868. In the Senate he was a member of the committees on Private Land Claims, Education, Pensions, and on Appropriations. At the close of his term, in 1873, he was appointed assistant secretary of the treasury, and he held the office about a year. Soon after the appointment of Gen. Benjamin H. Bristow to be Secretary of the Treasury, Mr. Sawyer and other Treasury officials were charged with having procured the payment of a fraudulent cotton claim while employed in the department. The officials were convicted and sent to jail; but on a second trial it was shown that Mr. Sawyer had received none of the money, and he was acquitted.

Sawyer, Lorenzo, jurist, born in Jefferson County, N. Y., in 1820; died in San Francisco, Cal., Sept. 7, 1891. He was brought up on a farm till sixteen years old, taught school, and attended for a short time the Western Reserve College. Studied law, was admitted to the bar, and in 1850 went to California as a member of the "Badger Train." He practiced at different times in Sacramento, Nevada City, and San Francisco, was elected city attorney of the latter city in 1854, and lacked only six votes to secure the nomination for judge of the Supreme Court in 1856. In 1862 he was appointed judge of the 12th Judicial District of California to fill a vacancy, and after serving five months was elected for a full term, having the support of both parties. Subsequently, on the reorganization of the State courts, he was again elected for a full term, in the two last years of which he was chief justice. In 1869 he was appointed judge of the United States District Court for the Northern District of California, and he held the office till his death. While a State judge he attracted wide attention by overruling a decision denying Chinamen the right to testify in courts, on the ground that such prohibition conflicted with the fourteenth amendment to the Federal Constitution.

Schultz, Jackson S., manufacturer, born in Hyde Park, N. Y., Nov. 9, 1815; died in New York city, March 1, 1891. He was the son of a tanner, with whom he learned the trade, and early in life became a clerk in the leather house of Smith, Schultz & Co., New York city, of which his father was a partner. In 1838 this firm was dissolved; and after young Schultz had conducted the business alone for a year, he organized the firm of Young & Schultz, which continued in that form till 1854, when a third member was admitted, and the name became Young, Schultz & Co. Further changes were made in 1857 and 1867, the firm becoming Schultz, Southwick & Co. in the latter year and remaining so till 1884, when Mr. Schultz retired, and the firm of Schultz, Innes & Co. was formed. Mr. Schultz always took a keen interest in the public affairs of the city, but it was in the movement that resulted in the exposure of the Tweed ring and the arrest and successful prosecution of William M. Tweed that he particularly earned the thanks of the community. He was a member of the Committee of Seventy which was appointed in September, 1871, and which, after the ring exposure, reported a reform charter for the city; and, later, he was conspicuous in the agitation of New York merchants against the moiety system of the Federal Government enforced against the importers. In 1873 he was appointed United States Commissioner to the World's Exhibition in Vienna. He discovered or invented many improvements in the art of tanning, and he also published a work on the history and art of that industry.

Scotfield, Glenni William, jurist, born in Chautauqua County, N. Y., March 11, 1817; died in Warren, Pa., Aug. 30, 1891. He was graduated at Hamilton College in 1840, and was admitted to the bar in Warren, Pa., in 1843. In 1850 and 1851 he was a member of the Pennsylvania Assembly, in 1857-'59 was in the State Senate, and in 1861 was appointed president judge of the 18th Judicial District of the State. He was elected to Congress from the 19th Pennsylvania District as a Republican in 1862, and was re-elected five consecutive times. There he was chairman of the standing Committee on Naval Affairs and of the select committee to investigate the legislative troubles in Louisiana. In the latter part of his congressional service his name was unfavorably connected with the Crédit Mobilier scandal. In March, 1878, he was appointed Register of the Treasury, and he held the office till 1881, when he was appointed a judge of the United States Court of Claims. He retired from his last office a few weeks before his death.

Scott, William Lawrence, capitalist, born in Washington, D. C., July 2, 1828; died in Newport, R. I., Sept. 19, 1891. He received a common-school education, and when twelve years old was appointed a page in the national House of Representatives, where he served for six years. Near the close of his last term he attracted the attention of Representative Reed, then engaged in the lake trade at Erie, Pa., who gave him a place as clerk in his shipping office. In 1850 he engaged in the coal and shipping business on his own account, soon afterward bought and ran several vessels on the Great Lakes, and subsequently, becoming interested in coal mining, iron manufacturing, and railroad operations, attained large wealth. At one time he was president or director of railroad companies owning or controlling more than 22,000 miles of completed road, and was the confidential manager of many enterprises in which Samuel J. Tilden was interested. At the beginning of the civil war he organized and equipped, at an expense of \$30,000, the Scott Battery. In 1868 he was a delegate to the National Democratic Convention in New York; in 1880, delegate-at-large from Pennsylvania to the convention in Cincinnati; in 1876-'84 was a member of the Democratic National Committee; in 1866 and 1871 was Mayor of Erie; and in 1884 was elected a member of the House of Representatives, in which he had served as a page forty-four years previously. He was re-elected from the 27th Pennsylvania Dis-

trict as a Democrat in 1886, and in his second term served as a member of the Committees on Ways and Means and on Expenditures in the Navy Department. Mr. Scott bought many noted horses, and established a great breeding farm on the old Tazewell estate in Virginia.

Scoville, Jonathan, manufacturer, born in Salisbury, Conn., July 14, 1830; died in New York city, March 4, 1891. He was educated in the public schools and in Yale Scientific School, established a blast furnace in Oneida County, N. Y., in 1850, and car-wheel factories in Toronto, Canada, and Buffalo, N. Y., in 1860, and with a brother made the Buffalo factory one of the largest of its kind in the country. In 1881 he was elected to Congress as a Democrat from the Erie District to fill a vacancy, and in the following year he was elected for a full term. His only other public office was that of Mayor of Buffalo, to which he was elected in 1884. Mr. Scoville bequeathed \$25,000 to the Buffalo General Hospital for the establishment of a training school for nurses, \$5,000 each to the Buffalo Orphan Asylum, Buffalo Fine Arts Academy, Buffalo Historical Society, the Home of the Friendless, and St. Vincent's Female Asylum, \$3,000 to the Roman Catholic Church Society in Lakeview, Ontario, the interest of \$5,000 in perpetuity to St. John's Episcopal Society of Salisbury, Conn., and \$500 per annum to the Methodist Episcopal Union Chapel of Chapinville.

Searles, Mary Frances Sherwood, capitalist, born in New York city about 1821; died in Methuen, Mass., July 25, 1891. She was one of several daughters of William Sherwood, removed with the family to Great Barrington, Mass., in early life; married Mark Hopkins in 1848, and accompanied him to California in the following year. They settled in Sacramento, and soon afterward Mr. Hopkins formed a partnership with Collis P. Huntington, and the firm began dealing in the various commodities needed by the miners. Subsequently the firm united with another, composed of Leland Stanford and Charles Crocker, and the four men began building a railroad from Sacramento to Placerville. They then proposed the construction of a railroad across the Rocky mountains, and, when Congress passed the bill giving a subsidy of \$48,000 for every mile in the mountainous country and \$30,000 for every mile on the plains they organized the Central Pacific Railroad Company and divided the four principal offices between themselves, Mr. Hopkins taking that of treasurer. The four men built the road in about five years, and it was supposed they each cleared nearly \$50,000,000 by the transaction. Mr. and Mrs. Hopkins then removed to San Francisco, where they built a residence on Nob Hill that cost \$1,250,000. Mr. Hopkins died in April, 1878, leaving an estate variously estimated at from \$30,000,000 to \$60,000,000. His widow then left San Francisco, and for several years lived alternately in New York city, Paris, London, and Great Barrington, building a costly residence at each place, as well as in Methuen and on Block Island. About 1885 she determined to erect at Great Barrington a residence that should surpass in size and beauty her Nob Hill estate, and cost about \$5,000,000. Edward F. Searles, who had been engaged to go to San Francisco to re-decorate the mansion there, executed his commission so satisfactorily that on its completion he was placed in charge of her contemplated palace in Great Barrington. While prosecuting this work he became architect, superintendent, financial manager, and confidential adviser, and on Nov. 9, 1887, he married his wealthy employer. Excepting occasional trips to Europe and to Mr. Searles's home in Methuen, they lived in the Kellogg Terrace palace at Great Barrington till her fatal illness. Mrs. Searles had no children, but many years ago had adopted a youth, who took the name of Timothy Hopkins. She bequeathed all her property to her husband, and after a sensational hearing in the courts all opposition suddenly ceased and by a compromise Mr. Hopkins received about \$3,000,000.

Seton, Catharine, philanthropist, born in New York city, June 28, 1800; died there, April 3, 1891. She was the only surviving daughter of Mrs. Elizabeth Seton, founder of the Roman Catholic order of Sisters of Charity in the United States, and after the death of her mother, in 1821, she was a member of the family of Gen. Harper, of Baltimore, till she became a sister. Returning to New York city, she applied herself almost exclusively to the care and instruction of the poor and to befriending prisoners. For twenty-five years she was a constant visitor to the New York city prison (the Tombs). At the time of her death she was the oldest member of the Order of Mercy, of which she was one of the first members.

Seward, Sara Cornelia, physician, born in Florida, N. Y., June 8, 1833; died in Allahabad, India, June 12, 1891. She was the daughter of George W. Seward, youngest brother of William H. Seward, and a sister of the late Rev. S. S. Seward, D. D., and of George F. Seward, ex-United States minister to China. She was graduated at Miss Willard's Troy Female Seminary, and at the Woman's Medical College in Philadelphia in 1860, and in 1861-'65 was in China with her brother. While she was studying medicine Sir William Muir, Governor of the Northwestern Provinces of India, suggested to the Zenana Missionary Society the desirability of having women physicians to practice among the women of India, whom male practitioners were never allowed to see. In response to an appeal from the society, Dr. Seward volunteered to go to India, and left New York in December, 1871. She established herself at Allahabad, and labored there with great success till her death, at first under the jurisdiction of the British Government, but for many years under that of the Presbyterian Board of Foreign Missions of the United States. She had two dispensaries in the city, both of which were visited every day and showed an attendance of from forty to eighty patients, and also a large practice in private houses and in missionary families.

Seymour, Truman, military officer, born in Burlington, Vt., Sept. 25, 1824; died in Florence, Italy, Oct. 30, 1891. He was graduated at the United States Military Academy and appointed brevet 2d lieutenant 1st Artillery, July 1, 1846; was promoted 2d lieutenant March 3, and 1st lieutenant Aug. 26, 1847; captain, Nov. 22, 1860; was transferred to the 5th Artillery, May 14, 1861; promoted major, Aug. 13, 1866; and was retired, Nov. 1, 1876. In the volunteer army he was commissioned brigadier-general, April 26, 1862; brevetted major-general, March 13, 1865; and was mustered out of the service, Aug. 24 following. During his military career he was brevetted 1st lieutenant, April 18, 1847, for gallantry at Cerro Gordo; captain, Aug. 20 following, for Contreras and Churubusco; major, April 14, 1861, for the defense of Fort Sumter; lieutenant-colonel, Sept. 14, and colonel, Sept. 17, 1862, for South Mountain and Antietam; and brigadier-general and major-general, March 13, 1865, for Petersburg, for services during the war, and for "ability and energy in handling his division and for gallantry and valuable services in action." In his long service he distinguished himself in the Mexican, the Seminole, and the civil wars. He was a member of Major Anderson's staff in the defense of Fort Sumter. Among his brilliant feats in the civil war were his leading in the unsuccessful assault on Fort Wagner, where he was severely wounded, and his three hours' battle with the Confederates under Gen. Joseph E. Johnston, near Olustee, Fla., whence he was forced to retire to Jacksonville. He was taken prisoner in the battle of the Wilderness, May 6, 1864, and, by order of Gen. Samuel Jones, was placed in the line of fire of the Federal batteries on Morris Island. After his release, on Aug. 9, he commanded a division in the Shenandoah valley and Richmond campaigns, and was conspicuous in the siege of and final attack on Petersburg. After the war he commanded forts in Florida, Fort Warren, Mass., and Fort Preble, Me., till his retirement. Since his retirement he had lived in Europe, most of the time in Florence.

Sibley, Henry Hastings, pioneer, born in Detroit, Mich., Feb. 20, 1811; died in St. Paul, Minn., Feb. 17, 1891. He was graduated at Detroit Academy, took a special course in Greek and Latin, and read law, but in 1829 became clerk to the sutler at Sault Ste. Marie. Soon afterward he took a local agency of John Jacob Astor's fur company, and, after being in 1832-'34 a purchasing agent, he was given an interest in the company, and took charge of its business in the territory north of Lake Pepin extending to the British line, and west to the head waters of the tributaries of Missouri river. In 1834 he reached the mouth of Minnesota river, on a trip for the company, and, establishing his headquarters at St. Peter's (now Mendota), built the first stone house within the present limits of Minnesota. Two years afterward he was appointed by Gov. Chambers, of Iowa, a justice of the peace. In 1848 he was elected a delegate to Congress from Wisconsin Territory, and there secured the passage of a bill for the creation of Minnesota Territory. He was re-elected to Congress for two terms; in 1857 took part in the constitutional convention and was elected to the Territorial Legislature; and on the admission of Minnesota as a State, in 1858, he was elected its first Governor, as a Democrat. In 1862, at the time of the Sioux Indian outbreak, he organized and commanded the troops raised for the protection of the frontier settlers, and was commissioned a brigadier-general. During this campaign he took about 2,000 Indian prisoners, tried more than 400 of them by court-martial, and on Sept. 29, 1862, executed thirty-eight at one time, only President Lincoln's direct orders preventing the execution of many more. Gen. Sibley was promoted major-general, Nov. 29, 1865; was relieved of his command in Minnesota in August, 1866; and was detailed as a member of a commission to negotiate treaties with the Sioux and other hostiles along the upper Missouri river. In 1871 he served another term in the Legislature, and afterward lived quietly in St. Paul. He was a regent of the State University, President of the State Normal School Board, and a member of the United States Board of Indian Commissioners.

Smith, John Gregory, lawyer, born in St. Albans, Vt., July 22, 1818; died there, Nov. 6, 1891. He was graduated at the University of Vermont in 1842, and at Yale Law School soon afterward, and began practicing with his father before the Franklin County bar in his native State. In 1849 he became counsel for the Vermont Central (projected by his father) and the Vermont and Canadian railroads; in 1858-'73 he was one of the receivers of the former road; in 1866-'72 he was President of the Northern Pacific Railroad; and since 1873 he had been President of the reorganized Vermont Central Road. He was a Republican, and had held many public offices. In 1859 and 1860 he was a State Senator; in 1861 and 1862 he was an assemblyman; in 1863 and 1864 he was Governor of Vermont; and in 1872, 1880, and 1884 he was delegate-at-large to the National Republican Convention and chairman of the delegation. He was also several times President of the State Republican Convention, and several times declined nomination and appointment to the United States Senate. Gov. Smith bequeathed \$10,000 to his native city for a public library, \$5,000 for a soldiers' monument, and \$3,000 to the 1st Congregational Church of St. Albans.

Smith, Thomas Ludington, physician, born in Orange, N. J., Aug. 13, 1800; died in Brooklyn, N. Y., Aug. 13, 1891. He was graduated at the College of Physicians and Surgeons in New York city in 1822, and at the Eye and Ear Infirmary in 1823; established himself in practice in New York in 1824; and was appointed a surgeon's mate in the United States navy in March, 1828. In 1830 he accompanied the frigate "Hudson" to Brazil; in 1831-'34 was on duty on the receiving ship "Franklin"; in 1837 was promoted surgeon; in 1838 was attached to the "Macedonian" in the West India squadron; in 1842 to the "Congress" in the Mediterranean; in 1843-'46 to the "Pennsylvania"; and in 1847-'49 to the Brooklyn

Navy Yard. He was fleet-surgeon of Commodore Perry's expedition to Japan in 1854, and, after serving at the Brooklyn Navy Yard and on the "Constellation" in the African squadron, he had charge of the Naval Hospital at New York in 1861-'65. After the war he was on leave orders for several years, and in 1871 he was appointed medical director, with the rank of commodore, and was retired.

Spear, Samuel T., clergyman, born in Ballston Spa, N. Y., March 4, 1812; died in Brooklyn, N. Y., April 1, 1891. He was graduated at the College of Physicians and Surgeons in New York city, had his attention drawn to the ministry soon afterward, studied theology in Troy, N. Y., and was ordained in the Presbyterian Church, in 1835. He was first settled over the 2d Presbyterian Church in Lansingburg, N. Y. In 1843 he was called to a church in Brooklyn, N. Y., and served it uninterruptedly for twenty-seven years, resigning in 1870 to accept an editorial place on "The Independent." Excepting occasional preaching, he passed the remainder of his life in editorial and other literary work. His publications included books on "Family Power," "Bible Heroes," "Church and State," and "The Federal Judiciary." Dr. Spear defended the Rev. T. De Witt Talmage in the trial before the Brooklyn Presbytery.

Spinola, Francis B., legislator, born in Stony Brook, Long Island, N. Y., March 19, 1821; died in Washington, D. C., April 14, 1891. He received an academical education, was admitted to the bar in New York city in 1844, and served five years as alderman, six years as assemblyman, and four years as State Senator. He was a delegate to the National Democratic Convention in Charleston in 1860. In the early part of the civil war he recruited and organized the "Empire" brigade of four regiments, which he accompanied to the front, and on Oct. 2, 1862, he was commissioned brigadier-general of volunteers. He served till the close of the war, and in leading a charge at Wapping Heights, Va., he was twice wounded. Returning to New York city, he engaged in the banking and insurance business and resumed political life. In 1886 and 1888 he was elected to Congress from the 10th New York District, as a Democrat, where he served as a member of the committees on Military Affairs and on War Claims.

Staples, Hamilton Barclay, jurist, born in Mendon, Mass., Feb. 14, 1829; died in Worcester, Mass., Aug. 2, 1891. He was graduated at Brown University in 1851, studied law with Chief-Justice Ames, of Rhode Island, and Peter C. Bacon, of Worcester, and was admitted to the bar in 1854. He began practicing in Milford with Gen. A. P. Underwood, and in 1869 returned to Worcester. Soon afterward he was elected district-attorney for the Middle District of Massachusetts, and he held the office for eight years. He was appointed a judge of the Superior Court of Massachusetts, in 1881, and held that office till his death.

Starr, Samuel H., military officer, born in Leyden, N. Y., July 31, 1810; died in Philadelphia, Pa., Nov. 25, 1891. He entered the United States army as a private in the 4th Artillery, Oct. 27, 1832, was promoted corporal and sergeant within two years, and, after serving in the Creek and Seminole wars, was discharged from the service honorably, Oct. 26, 1837. At the declaration of war with Mexico he re-entered the service as a private in the battalion of engineers, was soon promoted corporal and sergeant, and for bravery in action was brevetted 2d lieutenant 2d Dragoons, June 28, 1848. In the following month he was advanced to the full rank. On Nov. 10, 1851, he was promoted 1st lieutenant; June 14, 1858, captain; April 25, 1863, major of the 6th Cavalry; and Dec. 15, 1870, was retired with the rank of colonel. In the civil war he was commissioned colonel of the 5th New Jersey Infantry, Aug. 24, 1861; served with the Army of the Potomac and with Sheridan in the Shenandoah valley till 1864, excepting a short period of mustering duty in Ohio; and was afterward a special inspector of cavalry in the armies of the Potomac and the James. He was brevetted major, lieutenant-colonel,

and colonel, for services at Williamsburg and Upperville, Va., and in the Gettysburg campaign.

Stewart, George W., inventor, born in Atlanta, Ga., in 1843; died in New York city, Dec. 9, 1891. He had invented several useful contrivances in the line of agricultural implements, and had come to New York to interest capitalists in his last invention—the aquaphone—an apparatus for signaling between ships at sea. After spending a day in explaining his invention to a company of interested capitalists, he returned to his hotel and fell dead.

Storer, David Humphreys, educator, born in Portland, Me., in 1804; died in Boston, Mass., Sept. 10, 1891. He was a son of Judge Woodbury Storer, and a grandson of Gov. John Langdon, of New Hampshire, and was graduated at Bowdoin College in 1822, and at the Harvard Medical School in 1825. For twenty-two years he was dean of the Harvard Medical School, besides filling in it the chair of Obstetrics and Legal Medicine, and he was also President of the American Medical Association, a member of the Massachusetts Medical Society, and of the American Academy of Arts and Sciences, and author of "A History of Massachusetts." For many years Dr Storer was a collaborator with Prof. Agassiz in natural history research.

Strong, William E., lawyer, born in Granville, Washington County, N. Y., Aug. 10, 1840; died in Florence, Italy, April 10, 1891. He was educated in Racine, Wis., and was admitted to the bar there in 1861. At the beginning of the civil war he raised a company, which was incorporated in the 2d Wisconsin Infantry, and with it he went to the front as captain. He took part in the battle of Bull Run, was promoted major of the 12th Wisconsin Infantry, Sept. 12, 1861, and during the remainder of the war served with the armies in the West. In October, 1862, he was attached to the staff of Gen. McKean as inspector-general of the 6th division of the right wing of the Army of the Tennessee, and two months afterward he was promoted to the staff of Gen. McPherson as inspector-general of the right wing of that army. He was commissioned lieutenant-colonel and inspector-general of the 17th Army Corps in February, 1863, and from April 20, 1864, till the close of the war he was inspector-general of the Department of the Tennessee. For gallantry at Atlanta he was promoted colonel, to date from July 22, 1864, and for meritorious conduct during the war he was brevetted brigadier-general March 21, 1865. Gen. Strong was inspector-general of the Freedman's Bureau from May, 1865, till September, 1866, and then retired to become secretary of the Peshtigo Lumber Company, belonging to the estate of William B. Ogden, of Chicago, whose niece he had married. In 1873 he was elected president of the company.

Stuart, Alexander Hugh Holmes, lawyer, born in Staunton, Va., April 2, 1807; died there, Feb. 13, 1891. He was graduated at the University of Virginia in 1828, and was admitted to the bar the same year. In 1832 he was a delegate to the Young Men's Convention in Washington, held in the political interests of Henry Clay; in 1836 he was elected to the Virginia House of Delegates, where he was conspicuous for his advocacy of a liberal system of internal improvements, and where he served three terms; and in 1840 and 1842 he was elected to Congress. He was a Clay presidential elector in 1844, and a Taylor elector in 1848. In September, 1850, he was appointed Secretary of the Interior, and he held the office till March, 1853. From 1857 till 1861 he was a member of the Virginia Senate, where he made a strong fight against the secession movement, and on the passage of the ordinance of secession announced his retirement from public life, to which he returned after the war. He was re-elected to Congress in 1865, but was not admitted. In 1876-'82 and 1884-'86 he was rector of the University of Virginia; in 1872 he succeeded Admiral Farragut as a trustee of the Peabody Educational Fund; and for many years was President of the Virginia Historical Society.

Stuart, Mary Maoro, philanthropist, born in New York city, in 1810; died there, Dec. 30, 1891. She was the daughter of Robert Maoro, one of the wealthiest merchants of New York in his day, and married Robert L. Stuart, head of the well-known firm of sugar refiners, R. L. & A. Stuart, about 1840. The Stuart brothers were noted for their gifts to charitable and educational institutions. In 1852 they began applying a certain percentage of their annual income to some form of charity, and their first gifts aggregated \$14,000. In 1879, on the death of Alexander, it was estimated that their joint gifts had amounted to \$1,391,000, and from the time of his brother's death till his own, in December, 1882, Robert gave more than \$500,000. Robert L. Stuart, having no near relatives, bequeathed his whole property absolutely to his widow, an estate valued at nearly \$6,000,000. The greater part of the benefactions of the brothers went to institutions connected with the Presbyterian Church, and after Robert's death his widow supplemented these gifts with others believed to aggregate \$1,500,000. By her will, executed Jan. 18, 1887, and three codicils, dated respectively Nov. 15, 1887, Nov. 25, 1889, and April 26, 1890, she made special bequests to relatives and personal friends, but she gave the bulk of her property to charitable and educational institutions. To the Lenox Library she gave her fine-art collections, valued at \$500,000, her collections of shells, minerals, and other natural-history specimens, a large portion of her library, and a residuary share in her estate, on conditions that the collections should be placed in a separate fire-proof structure and should never be exhibited on the Lord's Day. Other public bequests were \$5,000 each to nine charitable societies and institutions in New York city; \$10,000 to Cooper Union; \$25,000 to the New York Cancer Hospital; half of all the residue of her estate to the American Bible Society, the Board of Foreign Missions of the Presbyterian Church in the United States of America, the Board of Home Missions of the same Church, the Presbyterian Hospital in New York city, the Lenox Library, the Theological Seminary of the Presbyterian Church at Princeton, and the Board of Church Erection of the Presbyterian Church in the United States of America; and the other half to the Trustees of the Presbyterian Board of Publication, the Board of Education of the Presbyterian Church in the United States of America, the Presbyterian Board of Relief for Disabled Ministers and the Widows and Orphans of Deceased Ministers, the Board of Missions for Freedmen of the same Church, the American Sunday-school Union, the Trustees of the Presbytery of New York for church extension in the city, the New York Bible Society, the American Tract Society, the New City Mission and Tract Society, the Young Men's Christian Association of New York city, the Presbyterian Home for Aged Women, the Association for the Relief of Respectable Aged Indigent Females, the Home for Incurables, the Association for the Benefit of Colored Orphans, the Colored Home, the Children's Aid Society, the New York Juvenile Asylum, the Protestant Half-orphan Home, the Society for the Relief of Poor Widows with Small Children, the Society for the Relief of Destitute Children of Seamen, the New York Eye and Ear Infirmary, the New York Society for the Prevention of Cruelty to Children, the Manhattan Eye and Ear Hospital, the Society for the Relief of Ruptured and Crippled, the Woman's Hospital, and the Orphan Asylum at Bloomingdale. A computation of the value of her estate, \$5,000,000, would enable her executors to pay to each of the seven institutions to whom the first half of the residuary estate was given more than \$300,000, and to each of the twenty-six specified under the second half more than \$80,000, besides paying the specific bequests, which amounted to \$705,000. She originally intended giving \$50,000 to the American Museum of Natural History for its maintenance fund and her natural-history specimens and books relating thereto and \$50,000 to the Metro-

politan Museum of Art; but a fear that these institutions might be thrown open to the public on Sundays led her to make the disposition of the articles and money above noted by codicils.

Swift, John Franklin, lawyer, born in Bowling Green, Ky., Feb. 28, 1829; died in Tokio, Japan, March 10, 1891. When eighteen years old he removed to St. Louis, Mo., where he learned the tinsmith's trade. In 1852 he went to San Francisco and engaged in the produce business, till he began studying law, and in 1857 he was admitted to the bar. He soon became widely known as a constitutional lawyer and as an eloquent speaker, and was successful in managing large cases. In 1862 he began taking an active part in politics; in 1862, 1873, and 1877 he was a member of the Legislature; in 1875 was defeated as an independent candidate for Congress; in 1877 was elected to Congress as a Republican; and in 1880 he accompanied James B. Angell and William H. Trescott to Peking, where they negotiated a treaty between the United States and China. In 1886 he was defeated as the Republican candidate for Governor of California, and in March, 1889, he was appointed minister to Japan.

Taft, Alphonso, jurist, born in Townshend, Vt., Nov. 5, 1810; died in San Diego, Cal., May 21, 1891. He was graduated at Yale College in 1833, taught two years in the high school in Ellington, Conn., was a tutor and law student at Yale in 1835-'37, and was admitted to the bar in New Haven in 1838. In 1840 he removed to Cincinnati, where he acquired a large practice. He was a delegate to the National Republican Convention in 1856, and was defeated as Republican candidate for Congress the same year. In 1865 he was appointed judge of the Superior Court of Cincinnati to fill a vacancy, and on the expiration of the term he was twice elected to the office, once by the unanimous vote of both parties. From 1871, when he resigned, till 1876 he practiced law in partnership with two of his sons, and in 1875 he was defeated as candidate for the Republican nomination for Governor because of a judicial opinion he had rendered concerning the Bible in the public schools. In March, 1876, he was appointed Secretary of War, and in May following he was transferred to the office of Attorney-General, which he held till March, 1877. He then practiced law in Cincinnati till April, 1882, when he was appointed United States minister to Austria, whence he was transferred to Russia in 1884, where he served till August, 1885.

Talcott, Alvan, physician, born in North Bolton, Conn., Aug. 17, 1804; died in Guilford, Conn., Jan. 17, 1891. He was graduated at Yale College in 1824, and at the Yale Medical School in 1831; practiced in Vernon, Conn., till 1841, and in Guilford till about 1880, and was one of the best Greek scholars in the State. He spent much of his leisure for many years in preparing genealogies of the descendants of Guilford's forty original settlers; published a "Genealogy of the Chittenden Family" (1882); gave \$25,000 to Yale College to endow the Talcott professorship of Greek in 1888; and bequeathed his medical and surgical books and all his instruments to the medical department of the college.

Talmage, Goy, clergyman, born in Somerville, N. J., Dec. 7, 1821; died there, June 24, 1891. He was a brother of the Rev. Thomas De Witt Talmage, D. D., was graduated at Rutgers College in 1842, and then took a three years' course at the Theological Seminary in New Brunswick, N. J. After holding pastorates in several places in New York and New Jersey, he was chosen secretary of the Board of Domestic Missions of the Dutch Reformed Church in 1863. He was President of the General Synod of the Reformed Church of America in 1874. Dr. Talmage published numerous sermons and tracts, and was a frequent contributor to religious periodicals.

Taunt, Emory H., naval officer, born in New Jersey, about 1845; died in Bona, Congo Free State, Africa, Jan. 18, 1891. He was appointed a midshipman in the United States navy in 1865; was promoted ensign July 12, 1870, master Dec. 28, 1872, and lieu-

tenant Aug. 8, 1876; and resigned June 30, 1888. In 1884 he was attached to the "Thetis" on the Greeley relief expedition to the polar regions, and in the following year he went to Africa, and made the passage of the Congo river from its mouth to Stanley Falls. It is believed that the exposures during this trip affected his mind; for in October, 1887, while serving on the "Yantic," in New York harbor, he absented himself from his vessel for several days, for which he was tried and sentenced to be dismissed from the service; but he was allowed to resign. In December, 1888, he felt strong enough to make another trip to Africa, and was appointed United States consular agent at Boma, where he died.

Taylor, Alfred, naval officer, born in Fairfax County, Va., May 23, 1810; died in Washington, D. C., April 19, 1891. He was appointed a midshipman in the United States navy in 1825; was promoted passed midshipman June 4, 1831, lieutenant Feb. 3, 1837, commander Sept. 14, 1855, captain July 16, 1862, commodore Sept. 27, 1866, and rear-admiral Jan. 29, 1872; and was retired May 23, 1872. During his naval career he was on sea service eighteen years three months, on shore or other duty eighteen years three months, and was unemployed twenty-nine years six months. During the Mexican War he served on the "Cumberland" in the blockade of Vera Cruz; in 1855 he accompanied Commodore Perry on his expedition to Japan; in 1862-'65 he was attached to the navy yard at Boston; and in 1869 he was a light-house inspector.

Taylor, David, jurist, born in Carlisle, Schoharie County, N. Y., March 11, 1818; died in Milwaukee, Wis., April 3, 1891. He was graduated at Union College in 1841, and admitted to the bar of his native county in 1846. Soon afterward he removed to Sheboygan, Wis., and engaged in practice. He was district attorney of the county one term, was a member of the State Assembly in 1853 and of the State Senate in 1855-'56, and was elected judge of the 4th Judicial Circuit in 1857. He held this office till 1869, and just before the expiration of his second term he was again elected to the State Senate, where he served in 1869-'70. At the close of his term he removed to Fond du Lac. In 1876 he was appointed a commissioner to revise the statutes of Wisconsin, and on the enlargement of the State Supreme Court he was chosen without opposition one of the additional associate justices in 1878, in which capacity he served until his death.

Taylor, Julius S., geologist, born in Saratoga, N. Y., in 1808; died in Kankakee, Ill., April 11, 1891. He received a classical education in New York city, spent four years as a sailor before the mast, was graduated at Jefferson Medical College, Philadelphia, in 1835, and, after practicing for three years in Cape May, N. J., removed to Dayton, Ohio, whence he went to Kankakee in 1864. He became successful as a physician, but will doubtless be best remembered because of his researches and collections in geology. His many years spent in the Miami valley in Ohio afforded him opportunities to gratify his scientific tastes in a field then exceedingly rich and unbroken. He investigated with great care and patience every part of this region, and did much to establish the glacial-drift theory as a geological fact. His latter years were spent almost wholly in the field of paleontology. In 1880 he gave his collection of geological specimens, one of the most complete in the West, to Blackburn University, Carlinville, Ill., where, arranged by himself, it forms an important feature of the museum to which his name has been given.

Thatcher, James Kingsley, physician, born in New Haven, Conn., Oct. 19, 1847; died there, April 20, 1891. He was a son of Prof. Thomas A. Thatcher, was graduated at Yale College in 1868, was tutor in physics and zoölogy there in 1871-'79, and was appointed Professor of Physiology in the Yale Medical School in 1879, and in 1887 the subject of clinical medicine was added to his professorship. He made original investigations in comparative anatomy and

physiology, the results of which when published in 1877 attracted much attention in England and Germany, as they involved a criticism of Huxley and Gegenbauer on vertebrate evolution.

Thompson, John, financier, born in Peru, Berkshire County, Mass., Nov. 27, 1802; died in New York city, April 19, 1891. He was brought up on a farm, attending school in the winter; taught in Hampshire County, Mass., when nineteen years old; and began his business career in Poughkeepsie, N. Y., as agent of a lottery company authorized by the Legislature for the benefit of Union College. After working there three years he removed to New York city with a capital of \$2,000 and opened a broker's office in Wall Street. He soon recognized the necessity for a publication that would warn the business community against the counterfeit bank bills that were being widely circulated, and established "Thompson's Bank-note Reporter," the pioneer in its line, which at one time had a circulation of 100,000 copies a week. Early in the civil war he made the acquaintance of Secretary Chase, and for many years thereafter his advice was frequently sought by the financial officers of the Government. On June 17, 1861, he wrote to President Lincoln and Secretary Chase, urging that specie payments should be maintained and proposing a board of currency commissioners, whose duties he minutely outlined. Subsequently he proposed and strongly advocated the establishment of a national banking system, and, after the project had received congressional sanction, he founded the First National Bank of New York city in 1863. Owing to general opposition to the scheme, this bank was owned by the Thompson family almost exclusively; but the public came to its support and it flourished. In 1878 he severed his connection with this bank and organized the Chase National Bank, of which he was vice-president till 1884, and subsequently for a short period president. Mr. Thompson published a pamphlet on "Free Silver Lunatics" (New York, 1889), and had nearly completed at the time of his death a book on "Sixty Years in Wall Street."

Todd, Lemuel, lawyer, born in Carlisle, Pa., July 29, 1817; died there, May 12, 1891. He was graduated at Dickinson College in 1839, and was admitted to the bar in 1841. In 1854 he was elected to Congress from the 15th Pennsylvania District as a Republican; in 1856 was defeated for a second term; in 1857 was defeated by David Wilmot as candidate for the gubernatorial nomination; and in the same year was chairman of the Republican State Committee. He was president of the State conventions in 1863, 1868, and 1888; was major of the 1st Regiment, Pennsylvania Volunteer Reserve Corps during a part of the civil war, and was inspector-general of the State under Gov. Curtin. In 1872 he was again elected to Congress as one of the three Congressmen-at-large, and there served as a member of the Committee on Expenditures in the Post-office Department.

Tourgee, Eben, musical director, born in Warwick, R. I., June 1, 1834; died in Boston, Mass., April 12, 1891. He began business life as a helper in a calico-printing factory, studied in East Greenwich Academy, and in 1847-'51 worked in the cotton mills at Harrisville, R. I. During the latter period he found time to study music. In 1851 he opened a small music store in Fall River, and in 1853 began teaching music in the public schools and to private classes. Six years afterward he established a musical institute at East Greenwich; in 1863 he went to Europe to study; in 1864 he founded a conservatory in Providence, and in 1867 this school was removed to Boston and became the New England Conservatory of Music. Wesleyan University gave him the degree of Mus. Doc. In 1869 he organized the chorus of the Peace Jubilee. In 1872 the College of Music of Boston University was founded, and Dr. Tourgee was elected its dean. He gathered nearly 20,000 singers for the chorus of the World's Peace Jubilee in 1874, and organized and conducted the large chorus choir of the Music Hall Society in 1876.

Trimble, Joseph McDowell, clergyman, born in Hillsborough, Ky., in 1807; died in Columbus, Ohio, May 6, 1891. He removed to Ohio in childhood, was graduated at Ohio University, Athens, in 1828, and joined the Ohio Conference of the Methodist Episcopal Church in 1829. In 1834-'65 he was secretary of the Ohio Conference; from 1844 till his death he was a delegate to every General Conference of his Church; in 1848 and 1852 he was secretary of the General Conference; for five years he was a professor in Augusta College, Kentucky; in 1864-'68 he was assistant missionary secretary in the West; and for nearly forty years he was a trustee of Ohio Wesleyan University. Dr. Trimble discharged the duties of forty-eight appointments, gave his first dollar to aid in establishing Ohio Wesleyan University, founded the Preachers' Relief Society of his conference, and gave it in all \$65,000.

Tripp, Alonso, educator, born in Harwich, Mass., March 14, 1818; died in Newton, Mass., Dec. 20, 1891. He was bred to the sea, and visited Europe several times, his trip in 1847 being for the purpose of studying the principal educational systems. On his return he was engaged by the Massachusetts Board of Education to lecture before teachers' institutes, and subsequently he taught in New England academies, and delivered lectures on "France and Europe since 1848" before the principal educational institutions in the United States and Canada. In 1848 he published a book on his European travels, of which sixty editions were printed.

Tufta, Gardner, executive officer, born in Lynn, Mass., July 3, 1828; died in Boston, Mass., Nov. 23, 1891. He entered public life in 1861 as member of the State Assembly, and the same year became connected with the Post-office Department in Washington. In 1862 he was appointed by Gov. Andrew Massachusetts State agent at Washington, the first appointment of the kind by any governor, and he held the office till 1876. During this time he had the care of the sick, wounded, and dead soldiers of Massachusetts in the Army of the Potomac; established a free bureau for the collection of the pay, bounties, and pensions of soldiers from his State; collected more than \$1,000,000 on these accounts; and by appointment of Secretary Stanton served as a member of the board for the inspection of military hospitals and prisons in the Department of Washington. He was appointed a paymaster in the army in 1863, but at the request of the State authorities he resigned his commission and remained State agent. Under Gov. Claflin's administration he was appointed visiting agent for the Board of State Charities and agent for juvenile offenders in 1869, and held the office for ten years. He then became steward and treasurer of the State Reformatory for Women, and after five years' service there he was elected superintendent of the new State Reformatory at Concord in 1884, and held this office till his death.

Turney, Jacob, lawyer, born in Greensburg, Pa., Feb. 18, 1825; died there, Oct. 4, 1891. He received an academical education and was admitted to the bar in 1849. In 1850 he was elected district attorney for Westmoreland County, in 1853 was re-elected, in 1856 was a Democratic presidential elector, in 1857 was elected State Senator, in 1871 was defeated for the same office, and in 1874 and 1876 was elected to Congress from the 21st Pennsylvania District as a Democrat. He also served as a member of the committees on Elections and on Territories.

Twedy, John H., pioneer, born in Danbury, Conn., in 1814; died in Milwaukee, Wis., Nov. 12, 1891. He was graduated at Yale College, studied law and was admitted to the bar, and removed to Wisconsin in 1836. He was one of the earliest promoters of railroad extension in that State, having presented the draft of a proposition for the city to loan from \$100,000 to \$250,000 to aid the construction of any railroad that would connect Milwaukee with the Mississippi river at a public meeting in Milwaukee on Feb. 1, 1849. The adoption of his proposition was the first

step in the creation of the present great system of the Chicago, Milwaukee and St. Paul Railroad Company. In 1841-'42 he was elected to the Territorial Council, in 1846 to the Constitutional Convention, in 1847 to Congress as Territorial delegate, and in 1848 was defeated as the first Whig candidate for Governor. While in Congress he drew the enabling act for the admission of the Territory into the Union as a State. After serving in the Legislature in 1853 he withdrew from political life, and was afterward interested in financial corporations.

Usher, James M., clergyman, born in 1814; died in Medford, Mass., Dec. 31, 1891. He was apprenticed to the baker's trade, but when seventeen years old began preparing for the Universalist ministry, in which he was ordained in 1839. From 1839 till 1844 he lived in Lexington, Mass. He established the first Universalist paper in the United States in 1841, and remained its sole owner till 1863. In 1861 he acquired the "Trumpet," and in 1863 the "Christian Freeman." He was elected to the General Court from Lynn in 1848, and, at the request of Horace Mann, was appointed to the Committee on Public Education, and in 1851, 1857, and 1858 he was elected to the State Senate from Middlesex County. In 1858 he was also a presidential elector on the Democratic ticket. Afterward he became a Republican, an anti-slavery advocate, and founder of the Massachusetts Total Abstinence Society. In 1867 he was principal agent of the State at the Paris Exhibition.

Van Cleave, Horatio Phillips, military officer, born in Princeton, N. J., Nov. 23, 1809; died in Minneapolis, Minn., April 24, 1891. He was educated at Princeton and at the United States Military Academy, being graduated at the latter in 1831; served on frontier duty in the army from 1831 till 1836; resigned and engaged in farming near Monroe, Mich., till 1839; and, after teaching in Cincinnati, Ohio, one year, followed farming near Ann Arbor, Mich., till 1854. In 1855 he was a civil engineer in the State service, and in 1856 was appointed United States Surveyor of Public Lands in Minnesota. He was appointed colonel of the 2d Regiment of Minnesota Volunteers early in 1861, took part in the operations in Kentucky, was promoted brigadier-general of volunteers March 21, 1862, and with the Army of the Ohio was at the siege and capture of Corinth. At the battle of Stone River, Tenn., he was disabled by a wound, but he soon recovered and commanded his brigade at Chickamauga. From December, 1863, till Aug. 24, 1865, he was in command at Murfreesborough. He was brevetted major-general of volunteers March 13, 1865, and after the war, by special act of Congress, he was restored to the regular army and retired. In 1866-'70 and 1876-'82 he was Adjutant-General of Minnesota.

Van Dyke, Henry Jackson, clergyman, born in Abington, Pa., March 3, 1822; died in Brooklyn, N. Y., May 26, 1891. He was graduated at the University of Pennsylvania in 1843, and at Princeton Theological Seminary in 1845; was called to pastorates in Bridgeton, N. J., in 1845, Germantown, Pa., in 1852, and Brooklyn, N. Y., in 1853; and was moderator of the General Assembly of the Presbyterian Church in Brooklyn in 1876. For nearly forty years he had been pastor of the 2d Presbyterian Church in Brooklyn. He was active in the movement for the reunion of the old and new schools of the Church in 1870. He was a Calvinist of the Princeton school, and was a member of the General Assembly's Committee on Revision of the Westminster Confession of Faith. A few days before his death he was elected Roosevelt Professor of Systematic Theology in the Union Theological Seminary.

Vibbard, Chauncey, capitalist, born in Galway, Saratoga County, N. Y., Nov. 11, 1811; died in Macon, Ga., June 5, 1891. He was educated at Mott's Academy, in Albany, N. Y., became a grocery clerk when fifteen years old, afterward entered a wholesale dry-goods store in New York city, and in 1834 went to Montgomery, Ala., as a book-keeper. In 1836 he began his career in railroad work as chief clerk of the

newly opened Utica and Schenectady Railroad, of which Erastus Corning was president. In 1848 he was appointed general superintendent, and, on the consolidation of the various roads between Albany, Buffalo, and Niagara Falls, under the name of the New York Central, he was given a similar office in that corporation, which he held until 1865, having full charge of the reorganization and management of the road. He was elected to Congress from the 18th New York District as a Democrat in 1860, and there served on the committees on Post-offices and Post-roads and on Expenditures in the War Department. In 1862, at the request of the Secretary of War, he accepted temporarily the office of director and superintendent of the military railroads of the United States. After resigning the superintendency of the New York Central Railroad, Mr. Vibbard settled in New York city and applied himself to interests with which he had been connected for several years. He was one of the principal owners of the Day Line of steamers plying between Albany and New York, and was the capitalist in a large mercantile establishment in New York doing business almost exclusively with the Southern States. He was a director in the original Greenwich Street Elevated Railroad Company and in the central branch of the Union Pacific Company. In recent years he had been interested in railroad and other enterprises in the Southern States and in South America.

Wadhams, Edgar Philip, Roman Catholic Bishop of Ogdensburg, N. Y., born May 21, 1817; died Dec. 5, 1891. He was a native of Lewis, Essex County, N. Y., whence his family removed in 1822 to Westport. His parents were Episcopalians, and destined their son for the ministry. He was graduated at Middlebury College in 1838, entered the General Theological Seminary, New York city, where he received deacon's orders, and was sent to take charge of the missions at Port Henry and Ticonderoga. The tractarian movement in England was then at its height, and was beginning to be reflected in this country by numerous conversions from Anglicanism to Roman Catholicism. Of these converts, Mr. Wadhams was one of the first, being received into the Church in June, 1846. He went to St. Mary's Seminary, Baltimore, as a student, and was ordained priest Jan. 15, 1850, by the Rt. Rev. John McCloskey (afterward Cardinal), then Bishop of Albany, and was immediately appointed assistant in the Albany cathedral. Here he remained for many years, his genial social qualities and his sterling honesty endearing him to all the citizens, both Catholic and Protestant. In the latter part of 1865 he was made pastor of the cathedral and vicar-general of the diocese. In 1872 the diocese of Ogdensburg was created, Father Wadhams was unanimously recommended for its first bishop, and he was consecrated at Albany, May 5, 1872, by Archbishop McCloskey. He devoted himself to building churches and parochial schools in his diocese, and founded a college at Watertown, under the care of the Fathers of the Sacred Heart. He never indulged in controversy, and his administration was marked by his modest and unostentatious efforts to extend the sphere of influence of his Church. All his financial obligations were promptly met, and the affairs of the diocese were brought to a very prosperous condition. Feeling the increasing weight of years, some months before his death he caused steps to be taken looking to the appointment of a coadjutor, and the matter was under consideration at Rome.

Wadleigh, Bainbridge, lawyer, born in Bradford, N. H., Jan. 4, 1831; died in Boston, Mass., Jan. 24, 1891. He received an academical education, was admitted to the bar in 1850, and settled in Milford, N. H. In 1855, 1856, 1859, 1860, 1869, 1870, 1871, and 1872 he was a member of the State House of Representatives, and in 1872 was elected United States Senator as a Republican. He was a member of the committees on Patents, on Military Affairs, and on Elections. In 1880 he removed to Boston and resumed practice.

Walker, David S., jurist, born in Logan County, Ky., in 1815; died in Tallahassee, Fla., July 20, 1891. He removed to Florida about 1840, was the first State Senator from Leon and Wakulla Counties after Florida was admitted to the Union, and for many years was the leader of the Whig party in that State. He was elected Governor in 1865, and held the office till 1868. He held several offices of trust at different times, was once a candidate for the United States Senate, and at the time of his death was judge of the 2d Judicial Circuit Court.

Walling, George Washington, ex-Superintendent of police in New York city, born in Middletown township, Monmouth County, N. J., May 1, 1823; died in Holmdel, Monmouth County, N. J., Dec. 31, 1891. He was a son of Leonard Walling, a member of the Legislature of New Jersey, and a grandson of Daniel Walling, a soldier of the Revolutionary War. The first years of his manhood were spent as a sailor on the steamboats plying the harbor and rivers of New York city. In 1845 he was employed on the revenue steamer "Spencer"; was appointed a policeman of the city of New York on Dec. 22, 1847; was promoted captain in October, 1853, inspector Nov. 21, 1866, superintendent July 23, 1874; resigned June 9, 1885, and was granted a pension for his long and faithful services. He was engaged in suppressing the Astor Place riots in 1849; had command of a portion of the police force in the draft riots of July, 1863, when his services were especially conspicuous and effective; and was in command of the police in the Orange riots of July, 1871. After his retirement he returned to the county of his birth. At the time of his death he was a resident of Keyport, Monmouth County, N. J., one of the directors of the Keyport Banking Company, and chief of the fire department of that town.

Waterman, Robert Whitney, capitalist, born in Fairfield, N. Y., Dec. 25, 1826; died in San Diego, Cal., April 12, 1891. He removed to Sycamore, Ill., while a youth, worked in a country store till 1846, then engaged in business for himself in Belvidere, Ill., and in 1850-'52 was an unsuccessful miner in California. In 1853 he established the "Independent" in Wilmington, Ill.; in 1856 was active in the Fremont presidential canvass; and in 1858 took the stump in the Lincoln-Douglas senatorial contest. He returned to California in 1860 and purchased a ranch, which proved an unsuccessful venture; and, greatly reduced in funds, he went on an extensive prospecting tour and ultimately struck a rich silver ledge in Mohave Desert, which became the famous Calico mining district. From that time his career was prosperous, and besides his mining holdings he acquired large ranch properties. In 1868 he made his permanent residence in California; in 1886 was elected Lieutenant-Governor of the State on the Republican ticket; and in September, 1887, on the death of Gov. Bartlett, he became Governor, and held the office till 1891.

Watterson, Harvey Magee, journalist, born in Bedford, Tenn., Nov. 23, 1811; died in Louisville, Ky., Oct. 1, 1891. He received a classical education in Princeton, Ky., established a newspaper in Shelbyville, Tenn., in 1831; was elected to the Legislature in 1835, and to Congress in 1838 and 1840, and then, declining a renomination, was sent on a diplomatic mission to Buenos Ayres, where he remained a year. On his return he was re-elected to the Legislature, of which he became Speaker. In 1847-'51 he was editor and proprietor of the "Nashville Union," and in 1851 he was appointed editor of the "Washington Union." In 1860 he was a delegate to the National Democratic Convention, where he voted for Stephen A. Douglas, and was also a Douglas elector-at-large, and in 1861 he was a delegate to the State convention called to consider the question of secession. In all his political life he had been dominated by an uncompromising devotion to the Union, and, finding that his efforts to avert the impending disaster were futile, he retired to his Beach Grove home till the questions leading to the war had been settled by force of arms. When

Andrew Johnson became President Mr. Watterson was called by him to Washington, and for a time was his most intimate adviser. He practiced law there in 1865-79, and subsequently spent his time partly there and partly in Louisville, Ky., as an editorial writer on "The Courier-Journal," of which his son, Henry Watterson, has long been editor.

Waud, Alfred E., artist, born in London, England, in 1828; died in Marietta, Ga., April 6, 1891. He received his art education in his native city, removed to New York in 1858, and was one of the early exhibitors at the National Academy of Design, but became most widely known as an illustrator for the periodical press and of books. He was one of the war pictorial correspondents of "Harper's Weekly," and was one of the first artists in the country to make his illustrations in black and white. Since the war he had drawn much for illustrated weekly and monthly publications, and in recent years he had contributed numerous illustrations to the war articles in the "Century" magazine. At the time of his death he was making an extended sketching tour of the battle-fields in the South, for the purpose of illustrating a new series of war narratives.

Whitthorne, Washington Curran, lawyer, born in Marshall County, Tenn., April 19, 1825; died in Columbia, Tenn., Sept. 21, 1891. He was graduated at East Tennessee University, Knoxville, in 1843, studied law, and was admitted to the bar. He was a State Senator in 1855-58, and a member and Speaker of the Assembly in 1859; and was the Democratic presidential elector-at-large in 1860. Early in 1861 he was appointed assistant adjutant-general in the Confederate Army of Tennessee, and afterward was Adjutant-General of the State till the close of the war. In 1870 his political disabilities were removed by Congress, and in the same year he was elected to that body from the 7th Tennessee District as a Democrat. He was re-elected five times, was appointed United States Senator to fill the vacancy caused by the resignation of Howell E. Jackson in 1886, and served till March 8, 1887.

Wickersham, James Pyle, educator, born in Chester County, Pa., March 5, 1825; died in Lancaster, Pa., March 25, 1891. He became a teacher when sixteen years old, and principal of the Marietta Academy, Pennsylvania, at the age of twenty. In 1854 he was appointed the first superintendent of public schools in Lancaster County, and in the following year opened the first normal school in the State at Millersville. From 1866 till 1881 he was State Superintendent of Public Instruction, and during President Arthur's administration he was United States minister to Denmark. Dr. Wickersham had twice been President of the National Association of School Superintendents, had edited the "Pennsylvania School Teacher," and had published "School Economy" and "Methods of Instruction."

Wickham, Joseph Dresser, clergyman, born in Thompson, Conn., April 4, 1797; died in Manchester, Vt., May 12, 1891. He was graduated at Yale College in 1815, and for five years had been the last survivor of his class, and for three years the oldest graduate of the college. After graduating he acted as amanuensis to President Dwight for a year, was rector of the Hopkins Grammar School, New Haven, in the following year, and was a tutor in Yale and a student of theology in 1818-'20. In 1821 he became a missionary on Long Island, afterward labored in central New York in the service of the Presbyterian Education Society, and in 1823 was ordained to the ministry and installed pastor of the Congregational Church in Oxford, N. Y. For three years from 1825 he was in pastoral charge of the United Presbyterian Churches of New Rochelle and West Farms, N. Y.; in 1828-'34 was one of the proprietors of Washington Institute, New York city; in November, 1834, was installed pastor of the new Presbyterian Church in Matteawan, N. Y.; and in 1837-'62 he was in charge of Burr Seminary, Manchester, Vt., excepting for three years, when he was treasurer and acting Professor of Greek

and Latin in Middlebury College and was connected with the collegiate institute, Poughkeepsie, N. Y.

Wiestling, George B., civil engineer, born in Harrisburg, Pa., Jan. 28, 1835; died in Chambersburg, Pa., June 17, 1891. In early life he was a civil engineer in the employ of the Pennsylvania Railroad, and afterward he built the large tunnel on the Delaware, Lackawanna and Western Railroad at Oxford Furnace, N. J. He served in the national army through the civil war, invented for the Government an attachment designed to assist the movement of heavy artillery through the deep mud in Virginia, and was with Gen. Kearney's brigade during the advance from Burke's Station to Bull Run. One of his scouts captured the Confederate mail that contained an announcement of the intended movement of Gen. Longstreet's corps upon Norfolk, and the capture resulted in the concentration of 30,000 national troops at Suffolk, where the Confederate advance was checked. He was a Republican presidential elector in 1880, first President of the United States Association of Charcoal Iron Workers, the first engineer to demonstrate that a furnace could be banked over Sunday, President of the Montalto Iron Company, and Superintendent of the Montalto Railroad.

Wild, Augustus, military officer, born in Brookline, Mass., in 1825; died in Medellin, Colombia, South America, in August, 1891. He was graduated at Harvard College in 1844, and at the Jefferson Medical College soon afterward; took a course of medical lectures in Paris; was a medical officer in the Turkish army during the Crimean War; and, returning to Brookline, practiced till the beginning of the civil war. Early in 1861 he was commissioned a captain in the 1st Massachusetts Volunteers, with which he served at Bull Run and in the Peninsular campaign, being severely wounded at Fair Oaks. He was promoted major while yet disabled, lieutenant-colonel on his recovery, and colonel of the 35th Massachusetts Volunteers on its organization; and he returned to the front in time to take part in the battle of South Mountain, where he was again wounded and lost an arm. On April 23, 1863, he was promoted brigadier-general of volunteers, and afterward he assisted in raising and commanded the regiments of colored troops known as Wild's African Brigade till the close of the war. Subsequently he became superintendent of the Diana mine at Austin, Nev. At the time of his death he was engaged in mining operations in South America.

Wiley, John, publisher, born in Flatbush, Long Island, N. Y., Oct. 4, 1808; died in East Orange, N. J., Feb. 21, 1891. He was the son of Charles Wiley, who published "The Spy," the first of James Fenimore Cooper's American romances. When seventeen years old he entered the publishing house in which his father was a partner, and on the death of his father, in 1828, he went into business for himself. In 1832 he formed a partnership with George Long, and subsequently, when George P. Putnam had completed his apprenticeship with Jonathan Leavitt, and had attained his majority, the firm of Wiley & Putnam was formed. The best known publication of the firm at this time was the series called "The Library of Choice Reading," edited by Evert A. Duyckinck. In 1848 Mr. Putnam retired from the firm, and after carrying on the business alone till 1865, Mr. Wiley took his son Charles into partnership. In 1875, when another son, William H., was admitted, the firm name was changed to John Wiley & Sons. In recent years the firm has made a specialty of scientific publications. Mr. Wiley was always a strong advocate of international copyright. He was the American publisher of Ruskin's works.

Wilson, Ephraim King, jurist, born in Snow Hill, Md., Dec. 22, 1821; died in Washington, D. C., Feb. 24, 1891. He was graduated at Jefferson College, Pennsylvania, in 1841, studied law, and was admitted to the bar. In 1847 he was elected a member of the Maryland House of Delegates; in 1852 was a Pierce and King presidential elector; in 1872 was elected to

Congress; and in 1878-'84 was judge of the 1st Judicial District of Maryland, which office he resigned on being elected United States Senator as a Democrat. At the time of his death he was a member of the Senate committees on Civil Service and Retrenchment, Claims, Post-offices, and Post-roads, Revision of the Laws, and on inquiry into all claims of citizens of the United States against the Government of Nicaragua.

Winchell, Alexander, geologist, born in North East, Dutchess County, N. Y., Dec. 31, 1824; died in Ann Arbor, Mich., Feb. 19, 1891. He was graduated at Wesleyan University in 1847; taught natural science in Pennington Seminary, New Jersey, in 1848; and in Amenia Seminary, New York, in 1849; and was engaged in educational work in Alabama in 1850-'54. In the latter year he became Professor of Physics and Civil Engineering in the University of Michigan, and after a year was transferred to the chair of Geology, Zoology, and Botany, which he held till 1873, in the mean time holding a similar chair in the University of Kentucky for three years. He was also director of the geological survey of Michigan in 1859-'61 and 1869-'71. In 1873 he was chosen Chancellor of Syracuse University, but he retired from the office at the end of the year to take the chair of Geology, Zoology, and Botany. He held this chair till 1879, and in 1875-'78 also held a similar chair in Vanderbilt University, dividing his time between the two institutions. In 1879 he returned to the University of Michigan as Professor of Geology and Palaeontology, and remained there till his death. He was a believer in the existence of a preadamite race. Among his numerous publications are: "Genealogy of the Family of Winchell in America" (Ann Arbor, 1869); "Sketches of Creation" (New York, 1870); "A Geological Chart" (1870); "Michigan," popular sketches of its topography, climate, and geology (1873); "The Doctrine of Evolution" (1874); "Reconciliation of Science and Religion" (1877); "Preadamites, or a Demonstration of Existence of Men before Adam" (Chicago, 1880); "Sparks from a Geologist's Hammer" (1881); "World Life, or Comparative Geology" (1883); "Geological Excursions, or the Rudiments of Geology for Young Learners" (1884); "Geological Studies, or Elements of Geology" (1886); and "Walks and Talks in the Geological Field" (1886).

Windom, William, lawyer, born in Waterford, Belmont County, Ohio, May 10, 1827; died in New York city, Jan. 29, 1891. He received an academical education, was apprenticed to the tailor's trade, studied law at Mount Vernon, Ohio, and was admitted to the bar of Knox County in 1850. In 1852 he was elected prosecuting attorney of Knox County, in 1855 removed to Winona, Minn., and in 1858 was elected to Congress as a Republican. He was re-elected four times, and at the close of his fifth term declined re-election. In July, 1870, he was appointed United States Senator to fill a vacancy caused by the death of Senator Daniel S. Norton; in January following he was elected to that office for a full term, and in 1877 he was re-elected. While a member of the House he served on the "Peace Committee" of thirty-three; on the committees on Public Lands, on Public Expenditures, on Indian Affairs; and on the special committee to visit the Indian tribes in the West; and also was active in promoting the passage of the homestead law of 1862. In the Senate he was chairman of the Com-

mittee on Appropriations, and in 1871 chairman of the special Committee on Transportation Routes to the Seaboard. He resigned his seat in the Senate on March 4, 1881, to enter President Garfield's Cabinet as Secretary of the Treasury, and with the rest of the Cabinet resigned his office on the accession of President Arthur, in September. On Oct. 26 he was re-elected Senator to fill his own unexpired term, and at its close, on March 3, 1883, he settled in New York city and became interested in financial enterprises. On the inauguration of President Harrison, in 1889, Mr. Windom was reappointed Secretary of the Treasury, and he held the office till his death. On the evening of Jan. 29, 1891, he attended a banquet of the New York Board of Trade and Transportation, and responded to the first toast, "Our Country's Prosperity dependent upon its Instruments of Commerce." He concluded a long and thoughtful address with the words: "Give us direct and ample transportation facilities under the American flag and controlled by American citizens, a currency sound in quality and adequate in quantity, an international bank to facilitate exchanges, and a system of reciprocity carefully adjusted within the lines of protection, and not only will our foreign commerce again invade every sea, but every American industry will be quickened and our whole people feel the impulse of a new and enduring prosperity," and a moment afterward he fell dead in his chair.

Witherspoon, Andrew Jackson, clergyman, born in Waxham settlement, S. C., in 1825; died in Moss Point, La., Oct. 25, 1891. He was educated at South Carolina College, and after studying law abandoned it for the ministry and settled in Alabama. During the civil war he was chaplain of the 21st Alabama Regiment, and by his bravery in action he became widely known as the "fighting chaplain." On one occasion, when the principal officers of his regiment had been killed or disabled in the early part of an engagement, he took command and led his men through a hard day's fight. He was in charge of the Seamen's Bethel in New Orleans for more than twenty years, and in that time he built a commodious church and dormitory for sailors.

Wood, Daniel F., lawyer, born in Pompey, N. Y., Nov. 5, 1819; died in Syracuse, N. Y., May 1, 1891. He was graduated at Hamilton College in 1843, and admitted to the bar in 1846, and was city attorney of Syracuse in 1850-'53. In 1853-'54 he was a member of the State Assembly, serving as chairman of the Committee on Colleges, Academies, and Common Schools, chairman of the Committee on Salt, and member of those on the Code and on Ways and Means. He matured and carried through the act creating the department of public instruction. He was returned to the Assembly in 1865, 1866, and 1867, and in that period was chairman of the committees on Canals and on Ways and Means. In 1871-'75 he was a State Senator, and in 1874 was appointed major-general of the 6th Division, N. G. S. N. Y., comprising the militia in eleven counties.

Young, Alexander, journalist, born in Boston, Mass., May 19, 1836; died there, March 19, 1891. He was graduated at the Harvard Law School in 1862, and practiced law till about 1872, when he became assistant editor of the newly established Boston "Globe." He remained there five years, in the mean time contributing to periodicals and adopting the pen-name of "Taverner." Subsequently he was the Boston correspondent of the New York "Critic" and a writer for the Boston "Post," "The Independent," and "The Christian Union." He published "History of the Netherlands" (Boston, 1884), and at the time of his death had nearly completed a work on "Old Boston."

Zabriskie, Francis Nicoll, clergyman, born in Hackensack, N. J., in April, 1832; died in Princeton, N. J., May 13, 1891. He was graduated at the University of the City of New York in 1850, and at the Theological Seminary of the Reformed Dutch Church at New Brunswick in 1855. In 1856-'59 he was pastor of the Reformed Church at Livingston, N. Y.; in 1859-'63 at

Coxsackie; in 1863-'66 at Ithaca; in 1866-'72 at Chav-
erack; in 1872-'76 at Saybrook, Conn.; and after-
ward, till his health forced him to give up the minis-
try, at Wollaston Heights, Mass. He was editor of
"The Christian Intelligencer" in 1880-'83, and one of
its weekly correspondents till shortly before his death,
writing under the pen-name of "Old Colony." He
also wrote regularly for "The Christian at Work,"
the New York "Observer," and other religious peri-
odicals. Dr. Zabriskie published "Story of a Love,"
"Golden Fruit from Bible Trees," "Precious Stones,"
and a life of Horace Greeley in the "American Ora-
tors and Reformers" series (New York, 1890).

OBITUARIES, FOREIGN. A'Beckett, Gilbert
Arthur, an English dramatist, born in London in 1837;
died there, Oct. 15, 1891. He was the son of Gilbert
Abbott A'Beckett, author of the "Comic Blackstone";
was educated at Westminster School and Christ
Church, Oxford, and was a clerk in the treasury until
he turned his attention wholly to literature. His dra-
matic pieces have been produced in all the principal
London theatres. He was the author of many suc-
cessful songs and of the librettos of "Canterbury Pil-
grims" and "Savonarola," operas by Dr. Villiers
Stanford, and with Herman Merivale he produced
the poetic drama called "The White Pilgrim." He
was also a composer of ballads, which were published
under an assumed name, and for the last twelve years
of his life he was one of the best-known contributors to
"Punch."

Acollas, Emile, a French writer on jurisprudence,
born in 1826; died in Paris, Oct. 17, 1891. He was
secretary to the Democratic Committee of the Indre
Department in the revolution of 1848, and was
elected to the Legislative Assembly in 1849. He
lectured on jurisprudence in France from 1850 till
1866, when he was condemned to a year's imprison-
ment for his open declaration in favor of a republic
at the meeting of the Democratic Federation in Ge-
neva. On his release he accepted the chair of Juris-
prudence in the University of Bern. Returning to
France after the fall of the empire, he endeavored to
establish courses of lectures on law for working men.
In 1876 he was supported by Garibaldi in an un-
successful attempt to win one of the Paris seats in the
Chamber. He founded "La Science Politique," a re-
view, in 1878, and published "Cours Elementaire du
Droit," "Droit et Liberté," an essay on paternity,
and one on the religious and Papal question.

Agar, Florence Leonide Charvin, known on the stage
as Madame, a French actress, born in Valence, Sept.
18, 1836; died in Algeria, Aug. 17, 1891. She went
to Paris in 1858 and played in the music halls till she
was advised to attempt tragedy, for which she was
fitted by her strong and mobile face and her resonant
voice. She made her *début* in "Phédre" at the
Odéon and achieved an instantaneous success; then
created brilliantly the rôle of Silvia in Cœpée's "Pus-
sant," in which Sarah Bernhardt had a great success
in the part of Zanetto. Madame Agar was admitted
to the Comédie Française in 1871, remained two
years, and after successful tours in the provinces and
abroad she returned in 1878 to create one of the chief
parts in "Fourchambault," by Emile Augier, after
which she left to star again.

Agop, Pasha Kassassian, a Turkish statesman, born
in Constantinople in 1833; died there, Sept. 19, 1891.
He was the son of a poor Armenian trader, and had
not the advantage of an education. His first public
appointment was a place on the police board of
Galata. In 1873 he received a higher appointment,
of which he was soon deprived on account of his re-
ligion, that of the orthodox Armenians. Becoming
dragoman of the Ottoman bank, he made the ac-
quaintance in his frequent calls at the palace of Os-
man Pasha, the Sultan's chamberlain, through whose
protection he was nominated by the Padishah a Mu-
dir of the Civil List in 1881, and quickly advanced
to the head of this ministry and made a pasha. He
was Minister of Finance for two months in 1888, and
recalled to that post in 1889, holding it till his

death. He negotiated a loan with the German bank
and arranged with Rothschild for the conversion of
the priority and Salieh bonds. He left the impression
on all who came in contact with him as Minister of
the Civil List or Minister of Finance of a strictly
honest man, whose single aim was to introduce order
into the chaos of the Ottoman finances and the im-
perial civil list.

Alarcon, Pedro Antonio de, a Spanish novelist, born in
1833; died in Madrid, July 20, 1891. He was origi-
nally destined by his family for the priesthood, but fol-
lowed an imperative literary impulse, and became a
master in the art of writing novels and short stories.
Many of his works of this description have been
translated into nearly every language. His romances
were not as good, and his essays in the drama were
not very successful. He wrote also on political sub-
jects without making an impression.

Alimonda, Gaetano, an Italian prelate, born in Genoa,
Oct. 23, 1815; died in Rome May 30, 1891. He en-
tered the priesthood at an early age, and became
famous as a preacher throughout Italy; was created
Bishop of Albenga in 1877, and on May 12, 1889, was
made a cardinal, under the title of Santa Maria in
Transpontina, by Leo XIII. In 1883 he was appointed
to the metropolitan see of Turin.

Arco-Valley, Count Ludwig, a German diplomatist,
born in Bavaria in 1845; died in Berlin, Oct. 15,
1891. He was educated at Munich, where he studied
law in the university, and in 1867 entered the diplo-
matic service as secretary to the Bavarian legation
near the Vatican. As a member of the Red Cross
Association he was made a prisoner by the French,
and would have been shot on suspicion that he was a
spy had not the intervention of President Thiers been
obtained. In 1871 he was sent to Washington as
secretary of the German legation, and in the follow-
ing year was transferred to Vienna, where he married
the famous actress Janisch, which led to his tempo-
rary dismissal from the imperial service. After his
separation from his wife he was again taken into
favor, and served successively as secretary to the
legations at Madrid, Paris, London, and the Quiri-
nal; went to Cairo as consul-general in 1886; and in
1888 was appointed minister plenipotentiary and en-
voy extraordinary to the United States, an office that
he still held at the time of his death.

Aube, Admiral, a French sailor, died in Toulon, Jan.
7, 1891. He was Governor of Martinique in 1879,
and was called to the head of the Ministry of Marine
in the following year. He held that huge ironclads
were useless for maritime defense, and that they
should be replaced by a system of torpedo flotillas
and gunboats. While in office he instituted a new
policy on these lines, but his successors have departed
from his programme.

Balmaceda, José Manuel, ex-President of Chili, born
in 1840; died in Santiago, Sept. 19, 1891. He came
of an old and wealthy Chilean family, and was edu-
cated in the Seminario Conciliar of Santiago with the
intention that he should follow the priestly vocation.
For this he had no inclination, and after a lively
youth he plunged into politics as soon as his studies
were completed, joining the Club de la Reforma, com-
posed of young men of advanced ideas, who discussed
far-reaching schemes for liberalizing the Constitution
of 1830. His gifts as an orator and capacity for leader-
ship made him the dominant spirit in the club, and
when he entered Congress at the age of twenty-eight
he was already marked out as a coming political leader,
and at once took a prominent part in the proceedings.
Soon his eloquence and skill in debate won for him
the place of parliamentary chief of the Liberal
party, composed of the progressive young men of the
country, who aimed at the extension of popular edu-
cation as a preliminary step toward democracy. This
was the dominant party in Congress, outnumbering
the Conservative or Clerical party and the Nationals
—who had co-operated in the anti-Clerical contest, but
recoiled from democratic reforms—both combined.
In advance of his party he advocated, in 1874, the

complete separation of church and state. After serving five terms in Congress he became Minister of the Interior in 1882, was subsequently a Senator, and as the most popular politician in Chili he was called into the Cabinet by President Santa Maria in 1885 as Minister of Foreign Affairs, as a candidate for the succession to the presidency. As Foreign Minister he added to his reputation, and when nominated for the presidency he was elected by an overwhelming majority, and on Sept. 18, 1886, was inducted into office. For the first three of his term of five years his party worked in complete harmony with him, and the country made great strides, political, social, and economical. Railroads were built, harbors improved, normal schools established, laws made more liberal, restrictions placed on the Church, and the popular approbation of the President was so unbounded that the opposition parties disappeared from the scene. When the time approached for choosing a successor to Balmaceda, who under the Constitution was not re-eligible, then the feuds between the rival candidates rent the party into factions; the powerful Conservative and National families and foreign capitalists whose designs he had crossed threw their influence on the side of the President's opponents; complaints of arbitrary conduct, religious oppression, personal wrongs, malversation and corruption, and interference with elections were raised. A bill was passed placing the electoral machinery under the control of the municipalities. The President vetoed this measure, and thus aroused a constitutional conflict between the executive and legislative powers ending in civil war (for the history of these events, see CHILI). When the Congressional party entered Santiago in triumph Balmaceda attempted to escape from the country on the torpedo vessel "Condell," but when he reached San Antonio Bay he found that she had sailed. He returned to Santiago, took refuge in the house of the Argentine minister, and two weeks later put an end to his own life by a pistol shot in the temple.

Banville, Théodore Faulain de, a French poet, born in Moulins in 1823; died in Paris, March 12, 1891. He was the son of a sea captain, and began to write poetry at the age of nineteen as a disciple of Victor Hugo and Alfred de Musset, but later preferred Greek models to the Romanticists. He attained a success with his "Odes Funambulesques" in 1857, and awakened expectations that were not realized in his subsequent works, although he succeeded in various styles of poetry and in the drama.

Baring, Thomas Charles, managing director of the re-constituted firm of Baring & Co., English bankers, born in 1831; died in Rome, Italy, April 2, 1891. He was a son of Charles Baring, Bishop of Durham, was educated at Harrow and Oxford, becoming a fellow of Brasenose College, was made a partner in the firm of Baring Bros. & Co., married an American lady, and for some years was the representative of the Barings in New York. He represented the southern division of Essex County in Parliament from 1874 till 1885, and from 1887 till his death represented the city of London. He acted with the Conservatives, but seldom spoke. He published some books, including "Pindar in English Rhyme" and "The System of Epicurus."

Baudouin, Prince, heir to the Belgian throne, born in Brussels, June 3, 1869; died there, Jan. 23, 1891. He was the eldest son of Philippe, Count of Flanders, the brother of King Leopold, and was born in the same year in which the King's only son died. He was well-developed physically, pleasing in appearance and manners, attentive to his duties as a captain in the army, and already trained by the King to some extent in the duties of his future station, and his sudden death from pneumonia was a blow to the Belgian people, with whom he was popular. As the Constitution precludes women from succeeding to the throne, the only hope of the dynasty is in the remaining son of the Count of Flanders, Prince Albert, who was born on April 8, 1875.

Bayard, Émile, a French painter, born in La Ferté-sous-Jouarre in 1836; died in Cairo, Egypt, Dec. 9, 1891. He was a pupil of Cogniet. He became known as a painter of war scenes, exhibiting a picture of a field hospital and similar works. A sensational group representing a duel between women, exhibited in the Salon, was finally bought to decorate a bar-room in New York. He received the cross of the Legion of Honor in 1870, and a silver medal at the Universal Exposition of 1889. "The Day after Waterloo" was exhibited in 1875, and in 1877 he had in the Salon two admirable panels representing bathers and skaters. As a painter he had a wide reputation, and as an illustrator of books he attained the highest distinction. With De Neuville he drew the wood engravings for the "Tour du Monde," and in 1889 and 1890 he exhibited drawings for illustration in the Salon.

Bazalgette, Sir Joseph, an English engineer, born in 1819; died in London, March 15, 1891. He entered the engineering profession in 1840. When the Metropolitan Board of Works was created at the time of the Crimean War he was appointed its chief engineer, and he continued in that post during the thirty-two years that it was the controlling public body in London. Before he planned and carried out a uniform drainage system the sewage flowed into the Thames, from which the water supply was drawn. As designed by him, three main sewers—one at a high level, running through Hampstead and Highgate, one at a middle level under Oxford Street, and a low-level sewer along the bank of the Thames and through the city—unite below, and are carried to the common outlet at Barking. For the last, the Thames embankment was built. He designed the Battersea bridge, the free Woolwich ferry, and many other works of engineering.

Béhic, Armand, a French politician, born in Paris, Jan. 15, 1809; died there, March 3, 1891. He was a deputy in the time of the July monarchy, a member of the Legislative Assembly in 1849, and one of the Council of State under the presidency of Prince Louis Napoleon, who, after the *coup d'état*, appointed him Secretary of the Finance Department, and afterward director of the Messageries Maritimes until he was called to replace M. Rouher as Minister of Agriculture, Commerce, and Public Works in the Cabinet formed on June 23, 1863. On his recommendation the agricultural inquiry of 1866 was ordered. He gave in his resignation in 1867 and became a Senator. The fall of the empire sent him back to private life until, as an eminent member of the Bonapartist party, he was elected a Senator for the Gironde in 1876.

Bennett, Sir James Risdon, an English physician, born in Romsey in 1809; died in London, Dec. 16, 1891. He was the son of a clergyman, was educated by private tutors, and studied medicine in Paris and in Edinburgh, where he was graduated M. D. in 1833. After traveling through Europe he settled in London in 1835, lectured at Charing Cross Hospital, and became assistant physician in 1843, and afterward resident physician at St. Thomas's Hospital, where he lectured on the practice of medicine. He was one of the founders of the Sydenham Society for the publication of medical works; was lecturer for many years to the College of Physicians, which he represented in the General Medical Council, and from 1876 till 1880 was its president. He published a treatise on "Diseases of the Ear" (from the German work of Kramer), an "Essay on Acute Hydrocephalus," "Lumleian Lectures on Cancerous and other Intrathoracic Growths," and papers in "Transactions" of the Pathological Society and in periodicals.

Berchère, Narcisse, a French painter, born in Étampes, Sept. 11, 1819; died in Paris, Sept. 21, 1891. He first exhibited in 1844, and attained a high place among the painters of Oriental subjects, which his frequent journeys to Egypt, Turkey, and Palestine enabled him to handle with exceptional intelligence. He was a writer of ability also, and is best known by his book entitled "Le Désert de Suez."

Berg, Christian, a Danish statesman, born in Tjaltrig, near Lemvig, in December, 1829; died in Copenhagen, Nov. 27, 1891. He was the son of a farmer, and until he became prominent in politics he followed the profession of a teacher. He was elected a Deputy for Kolding in 1865, and in 1870 became one of the leaders of the Left. In 1877 he was chosen chief of the Radical Opposition. From 1881 he edited the party organ the "Morgenbladet." In 1883 he was elected President of the Folkething. His bold and aggressive attacks on the Estrup ministry caused him to be arrested in 1886 and sentenced to prison for six months. Chiefly through his energy the long struggle for parliamentary government and ministerial responsibility has been kept up till the present time.

Blavatsky, Helena Petrovna, a Russian philosopher, born in the south of Russia about 1820; died in London, May 8, 1891. She was descended on her father's side from a noble family in Mecklenburg and through her mother from the princely family of Dolgoruki. She was married at the age of seventeen to Baron Blavatsky, a sexagenarian functionary holding a high office in Tiflis, but left him at the end of three months and traveled through Turkey, Greece, and Egypt. Afterward she lived a long time in the United States and Canada, studying the Indian race and traditions, and the mystic sects among the negroes. Going next to the East, she made an attempt to enter Tibet, and, failing in this, she traversed the British and Dutch East Indies, seeking to penetrate the mysteries of Buddhism and other Oriental beliefs. In 1855 she made another effort to reach the stronghold of Buddhism in Tibet, and by virtue of her courage and an Oriental disguise she succeeded, although her three companions were stopped. She underwent a hundred adventures in the deserts of that unknown country, and visited Turkestan also. After this she returned to the Caucasus, and then revisited Greece and Egypt, and in the latter country established a society for the study of modern spiritualism. Giving herself up to investigations of philosophy, psychology, and mysticism, she evolved a system of belief, and, in 1875, in conjunction with an American disciple, Col. Olcott, she founded the Theosophical Society, the curious tendencies of which in matters of religion and philosophy have attracted a great number of minds and have made many adepts. The esoteric doctrine of the sect that she founded, which looks to a sort of revival of Buddhism, she revealed in a voluminous series of works, the titles of which are: "Isis Unveiled," "The Secret Doctrine," "Synthesis of Science, Religion, and Philosophy," "Key to Theosophy," and "Voices of Silence." She also established a review in London, with the name of "Lucifer."

Bodichon, Barbara Leigh Smith, an English philanthropist, born in Watlington, Sussex, in 1827; died in Robertsbridge, Sussex, June 11, 1891. She was a daughter of Benjamin Smith, Liberal member of Parliament for Norwich; was unconventionally educated, and became at an early age a public champion of woman's emancipation and various social reforms, conducting, with Bessie Parkes, who became Madame Belloc, the "Englishwoman's Journal." In 1857 she married Dr. Eugène Bodichon, of Algiers, a distinguished French physician and writer, but did not cease to work for the improvement of the legal status of women. She joined Emily Davies in advancing a scheme in 1866 for the university education of women, which resulted in the establishment of Merton College. In 1869 she published the "Brief Summary of the Laws of England concerning Women," and the fruit of her efforts in this field was the married-women's property act. Madame Bodichon was an artist of considerable note. She exhibited in the Academy, the Salon, and elsewhere water colors in which the poetic qualities of natural scenery were brought out with original talent and power. She was George Eliot's bosom friend, and was intimate with many distinguished thinkers and poets.

Boisgobey, Fortuné de, a French novelist, died in Paris, March 4, 1891. He was the author of many

sensational romances in the vein of Gaboriau, which were exceedingly popular. His amiable qualities gained him many friends, and he took a lively interest in athletic sports. For some time before his death he was confined in an asylum.

Bonaparte, Prince Lucien, a French philologist, born in Thorngrove, near Worcester, England, Jan. 4, 1813; died in Fano, Italy, Nov. 4, 1891. He was the second son by his second wife of Prince Lucien Bonaparte, the elder brother of the Emperor Napoleon, who in consequence of a family quarrel was disgraced and excluded from the honors and dignities conferred on the younger two brothers and their descendants. The head of the family, which is the elder branch of the Bonaparte family and under the law of primogeniture would come first in the order of the imperial succession, is the late Prince Lucien's half-brother, Cardinal Bonaparte. Lucien was educated in England, where his father resided after the quarrel, and passed many years in the United States, devoting himself to linguistic studies and chemistry. In 1843 he was chosen a Deputy for Corsica, but the election was pronounced invalid. Soon afterward he was admitted to the Legislative Assembly as a Deputy for the Seine. He supported his cousin Louis Napoleon, and after the *coup d'état* was nominated a Senator and received the title of prince and the right to be addressed as Highness. Devoting himself chiefly to his philological and scientific studies, he published many memoirs and achieved a scientific reputation chiefly through his thorough investigation of the Basque language. He married Marianne Cecchi, the daughter of a sculptor of Lucca, in 1832, but lived apart from her for many years and left no children. His wife, Marianne Bonaparte, born in Lucca, March 27, 1812, lived in Ajaccio, Corsica, and died there on March 17, 1891.

Boulanger, Georges Ernest Jean Marie, French soldier and ex-Minister of War, born in Rennes, April 29, 1837; died in Brussels, Belgium, Sept. 30, 1891. (For a sketch of his life previous to his appointment to the Ministry of War and a steel portrait, see the "Annual Cyclopædia" for 1886.) He was popular with the soldiers of the army and known as their friend, though he had little fame outside when he was called to the Ministry of War in the Cabinet formed by M. de Freycinet on Jan. 7, 1886. He applied himself to improving the conditions of the soldier's life, obtaining the approbation of all who wished to see the army strong, and, aided by the friendship of his relative M. Clémenceau, was pushed forward into political prominence by the Extreme Left. Embracing this rôle, he took the lead in the measures for the expulsion of the Orléans princes, fought a duel with Baron Larécinty, and his growing popularity was scarcely injured by the publication of a servile letter that he wrote as a young officer to the Duc d'Aumale and the falsehood of his denial. As the organizer of democratic reforms in the army he enjoyed a well-earned popularity, which was crowned by the law substituting three years' universal service for five years with exemptions. He courted the admiration of the mob, was advertised by pictures and street songs, and when relations with Germany were strained by the Schnäbele incident, deliberately accepted the character of leader of *la revanche*. He remained at the War Office during the ministry of M. Goblet, but began to lose the support of M. Clémenceau and the more astute Radicals, and when M. Rouvier constituted his ministry his name was left out in spite of the threatening popular demand that he should be retained. When he challenged M. Ferry to a duel for calling him a "music-hall St.-Arnaud," he insisted on conditions that showed the purpose of killing the unpopular statesman in order to endear himself to the multitude. The turbulent cries for his recall placed him in the attitude of a revolutionist, and, deserted by the sober men of all parties, he entered into secret alliance with the various revolutionary groups—the Intransigents of M. de Rochefort, the League of Patriots of M. Dénodé,

the Anarchists, and, most important of all, with the Comte de Paris and the Orléanists, who furnished the money for the agitation by which he attempted to subvert the republic and become dictator. When the Limouzin scandal began he publicly charged the Minister of War with manufacturing it for the purpose of diverting public attention from him. For this he was ordered under arrest. Breaking his parole, he went to Paris during the presidential crisis, and might then have given the signal for an insurrection, but hesitated. The new President and his Cabinet were chosen for the special purpose of combating the danger of Boulangism. Adopting the cry for the revision of the Constitution, he organized a party and a political campaign with the money of the Duchesse d'Uzès and the Comte de Paris, was elected under the *scrutin de liste* with the aid of Royalist and Bonapartist votes, first in the Dordogne, and in April, 1888, by an enormous majority in the great Department of the Nord. In July his chances for the dictatorship were damped almost fatally by the outcome of a duel with M. Floquet, who had been insulted by him in the Chamber, in which the aged Premier almost killed the fire-eating soldier by a lunge in the neck. Noisy demonstrations and the arts of political advertisement restored his popularity, and his position was so strong when he presented himself as a candidate for the whole city of Paris in January, 1889, that he polled 245,236 votes to 162,875 given to the Republican candidate, M. Jacques. This was his second opportunity to play the part of a Bonaparte and seize the reins of power, but he lacked the courage or the sagacity to avail himself of it. M. Tirard formed a Cabinet with the avowed object of putting down Boulangism by new legislation if the existing laws were insufficient. M. Constans, the new Minister of the Interior, went to work boldly by suppressing the League of Patriots, and followed this up by secretly warning Gen. Boulanger that a worse fate than simple imprisonment was in store for him. Frightened by this vague intimation, the boastful representative of the military glory of France, to the amazement and disgust of all his partisans, fled in disguise to Brussels on April 2, 1889. The Senate was constituted into a high court of justice to try him and other fugitives for conspiracy and other crimes, and his friends adjured him to redeem his reputation by appearing at the trial. He was sentenced *in contumaciam* to imprisonment for life in a fortress. In the autumn a general election gave an overwhelming majority to the Republicans over the Boulangists and Monarchists combined. From a safe distance he continued to issue manifestoes, but his prestige was gone and most of the Boulangists who were not involved in his disgrace turned contemptuously away from him. The *scrutin de liste* imposed on the country by Gambetta was repealed. The prospects of the Comte de Paris were ruined by his perfidious alliance with Boulanger, and Prince Napoleon was implicated in a scarcely less degree, as was revealed in a series of articles published in the "Figaro" under the title of "Les Couilles de Boulangisme," by M. Mermeix, a Boulangist Deputy. Gen. Boulanger passed the remainder of his life in Jersey, London, and Brussels, and finally blew out his brains on the grave of Madame de Bonnemain, the companion of his flight and exile, for whom he had deserted his wife, and who had sacrificed her fortune in his cause. For a steel portrait of Gen. Boulanger, see "Annual Cyclopaedia" for 1886, page 352.

Bradlaugh, Charles, an English statesman, born in Hoxton, Sept. 26, 1833; died in London, Jan. 30, 1891. He went to work at an early age in the law office where his father was a clerk, was later a wharf clerk, a coal dealer, a traveling salesman, and, above all, a zealous teacher, first of religion in a Sunday school, and then of free thought after he had become a disciple of Richard Carlile at the age of nineteen. He was driven by poverty to enlist as a soldier, was made orderly clerk, and in 1853 purchased his discharge, after which he found employment as a law-

yer's clerk in London and at the same time lectured on religious subjects. Becoming known under the name of "Iconoclast" as an aggressive atheist, he entered on a career of pamphleteering and lecturing that made him one of the most notorious and the most obnoxious men in England. His audacious and contemptuous treatment of sacred subjects was repul-

sive to many who thought as he did, and he had conflicts with the authorities and was mobbed by his audiences, winning all the time converts and admirers by his courage, his adroitness, and his powers of speech, especially when defenders of orthodoxy undertook to vanquish him in argument on the same platform. In the Hall of Science, where he made his speeches in London, and in the pages of the "National Reformer" he advocated secular education, disestablishment, and the abolition of monarchy and aristocracy, and unfolded a political programme parts of which he and his friends believed could be brought into practical politics. After several attempts to get a seat in Parliament he was at last elected for Northampton in April, 1880. He had been prosecuted at various times, and his natural acumen and legal knowledge had been sharpened by his experience in the courts, as when, in 1861, the superintendent of police at Devonport had interfered with his lectures, and when he was successful in defying the Inland Revenue officials who attempted to apply an obsolete law to the "National Reformer," and when, in 1877, he succeeded in quashing the indictment after he and Mrs. Besant had been condemned to six months' imprisonment and a fine of £200 for publishing the book called "Fruits of Philosophy." A large number of the older members of Parliament were determined that he should not be received, and many Liberals shared this desire with the Conservatives. When he first appeared at the bar of the House he claimed the right to affirm. The matter was referred to a select committee, which reported against his right to take advantage of the acts created for the Quakers and Jews. Thereupon he offered to take the oath of allegiance, but another committee decided that he was not competent, and the House passed a resolution denying his right either to make affirmation or to go through the form of taking the oath. When he refused to recognize the authority of the House he was removed by the sergeant-at-arms, at first with a show of force, but on a repetition of the proceeding he struggled fiercely to remain. Session after session the same scenes were repeated. On Feb. 21, 1882, he went up to the table, drew a Bible from his pocket, and, before the House knew what he was about, recited the form of the oath. Successively excluded, he was always re-elected by his constituents. Among the many lawsuits that grew out of this contest, he successfully won the one brought against him for sitting and voting without having taken the oath and the

one that he brought against Mr. Newdegate for maintenance. It was not till 1886 that he was allowed to take the oath and begin his career as a member of Parliament. Two years later he and his friends succeeded in having the oaths act so amended that atheists are permitted, on account of conscientious scruples, to affirm. In Parliament he disgusted his former followers among the working people by opposing the extension of employers' liability, the eight-hour day, and other labor measures. By this attitude he established a strong bond of sympathy with the people who had been his bitterest opponents, and as he did not obtrude his irreligious views and devoted his energy and ingenuity to advocating academical opinions that roused little antagonism, with able arguments free from irritating allusions, he won the respect of the sober members of both parties and was listened to with more attention than the other Radicals. His denunciation of the perpetual pensions and sinecures enjoyed by members of noble houses sustained his reputation as a democratic Radical. Later he devoted himself to the more ambitious task of representing in Parliament the desires of the Hindus for representative institutions, and was accepted by them as their special advocate, the "Indian member." Under his mentorship the Indian Congress enlarged the scheme of representative government that had already obtained the approval of some practical Anglo-Indian administrators, thus putting off its realization, but with a hope of winning a greater ultimate success through his powerful advocacy. Visiting India in 1889 in the hope of restoring his shattered health, he took part in the Congress held at the end of that year. Three days before his death the House of Commons, without a dissenting voice, expunged the resolution of June 22, 1880, which refused him permission either to take the oath or to affirm when he claimed his seat.

Bratiano, Joan, a Roumanian statesman, born in Bucharest in 1821; died there, May 16, 1891. He served a short time in the Roumanian army, went to Paris in 1841, and studied in the Collège de France and the École Polytechnique, fought for the republic with his brother Demetrio in the revolution of February, 1848, returned to Bucharest in the following April, was appointed one of the secretaries of the Provisional Government, and became a leader of the Democratic party that aimed to free Roumania from Turkish dominion and keep the state equally free from dependence on Russia. During the revolution he was Minister of Police. With his brother he was proscribed after the intervention of Russia; and, returning to Paris, he engaged in journalism. Being condemned to prison for revolutionary writings in 1853 for the term of three years, he wrote and brought out in 1855 a "Mémorial on the Austrian Empire in the Eastern Question," and in 1857 he published a "Mémorial on the Situation of Moldo-Wallachia after the Treaty of Paris." In this year he and his brother returned to Bucharest, and as Deputies in the Provisional Assembly both made a name as orators. In 1875, when the impending Servian war reopened the Eastern question, Joan Bratiano, at the head of the National party, aspired to gain for the Roumanian nationality its share in the division of the Turkish Empire. He became President of the Council and Minister of Finance in the Cabinet constituted on July 24, 1876, exchanging this portfolio for that of the Interior later. He brought about the proclamation of Roumanian independence on May 21, 1877, and was forced into the alliance with Russia and the declaration of war against Turkey. For twelve years, with an intermission of two or three months in 1881, when his brother took the premiership, he guided the affairs of Roumania, which was erected into a kingdom in 1881. In 1886 an attempt was made on his life, the motive for which was not discovered. He made enemies by his arbitrary methods, and in 1888 was overthrown by a coalition of Junimists, Conservatives, and Liberals.

Bronsart von Schellendorff, Gen., German ex-Minister of War, born in Dantsie in 1832; died in Berlin, June

23, 1891. He was descended from Huguenot emigrants to Prussia. Entering the army as an officer of the Guards, he was soon called to staff duty, and in this capacity he went through the Austrian campaign with the 2d Army Corps. In the war of 1870-71 he had charge of a section of the general staff and was King William's messenger to Napoleon when the white flag was hung out at Sedan. Gen. von Moltke intrusted him with many delicate missions. After the peace he served as chief of the staff of the Guards Corps, and in 1883 was selected on account of his resolute and aggressive qualities to succeed Gen. von Kameke as Minister of War. He overcame the opposition of the Reichstag to the addition of 40,000 men to the peace footing, and pushed through the measures for the organization and armament of the Landwehr and Landsturm, which practically doubled the fighting strength of the empire. He was succeeded in 1888 by Gen. Verdy du Vernois, and after a brief retirement took command of the 1st Army Corps, which active post he held at the time of his sudden death. It was generally supposed that if war should break out Gen. Bronsart would be made commander-in-chief of the German army.

Carl, Friedrich Alexander, King of Württemberg, born in Stuttgart, March 6, 1823; died there, Oct. 6, 1891. He was the son of Wilhelm I, the second King, and married on July 13, 1846, the Grand Duchess Olga, daughter of the Czar Nicholas. On the death of his father, on June 25, 1864, he ascended the throne under the style of Carl I. During the period when Prussia was working for supremacy in Germany he strove against the consolidation under Prussian headship, but abandoned his particularistic tendencies and all political activity when he saw that resistance was useless, leaving to his strong-minded wife the direction of court affairs and the forms of a sovereignty that had lost its substance. Trained in military routine in his youth, he conceived a strong dislike for martial pomp. Modest and simple in his way of living, genial and hospitable in disposition, winning in his manners, he was an intelligent patron and lover of art and literature, and did much to make Stuttgart one of the artistic and intellectual centers of Germany. He embellished the city architecturally, fostered music, drama, and science; and at one time gathered about him a circle of bright authors, which included Franz Dingelstedt, Friedrich Hackländer, and Moritz von Hartmann. Toward the end of his life he chose for companions some Americans who initiated him into the study of hypnotism and similar phenomena. These persons were looked on in court circles as adventurers, and the Queen intervened and after a contest removed the King from their influence. The successor to the throne is Wilhelm II, grandson of the late King's uncle, who was born Feb. 25, 1848, and married for his second wife Princess Carlotta of Schaumburg-Lippe in 1886. If he dies without male issue the throne passes to the Catholic branch of the family.

Carter, Henry A. P., Hawaiian minister to the United States, born in Honolulu, Aug. 7, 1837; died in New York city, Nov. 7, 1891. He was sent to an aunt in Boston, Mass., for his early education, afterward attended the schools in Hawaii, joined the gold seekers in California, but returned and became a clerk and afterward a partner in the mercantile firm of C. Brewer & Co. He took an active part in negotiating the reciprocity treaty with the United States, and when Minister Elisha H. Allen suddenly died, in 1883, Mr. Carter, who had held important posts in the Hawaiian Government, among them those of Minister of Finance and Minister of the Interior, was appointed minister at Washington. He labored to secure the effective working of the treaty, which went into effect in 1887, and after the adoption of the new tariff to obtain from Congress the passage of a resolution so construing the tariff act as to preserve the reciprocity relations with Hawaii. In 1885-87 he went to Europe three times on special missions to the French and English governments.

Cellier, Alfred, an English composer, born in London in 1844; died there, Dec. 28, 1891. His parents were French. He was educated in London schools, entered the Chapel Royal in 1855, in 1862 was appointed organist of All Saints, Blackheath, and in 1865 became conductor of the Belfast Philharmonic Society and of the concerts in Ulster Hall in that city. He returned to London three years later, and was organist at St. Albans, Holborn, until he gave up the place in order to give his whole attention to the theatre. In 1871-75 he conducted an orchestra in Manchester, and in 1877-79 he led the orchestra of the Opera Comique, and alternated with Sir Arthur Sullivan at the Covent Garden concerts. His earliest operetta was "Charity begins at Home," produced in Manchester in 1870. There also he wrote for "Nell Gwynne" the music that was afterward adapted to the libretto of "Dorothy." His "Sultan of Mocha," the finest of his works, was brought out in Manchester in 1874, and, like these others, was reproduced later in London with another libretto. "Pandora," written for the words of Longfellow, was produced in Boston in 1881. His musical setting to Gray's "Elegy," written for the Leeds Festival of 1883, was not a popular success. Among his other works may be mentioned "The Tower of London" (1875); "The Specter Knight" (1878); "The Carp" (1886); "Mrs. Jarramie's Genie" (1888); and "Doris" (1889). His last work, "The Mountebanks," composed for a libretto by W. S. Gilbert, he worked on through the sufferings of his last illness. More happy in comic than in serious music, he enjoyed a wide popularity in Great Britain and America by reason of his neat and easy style of composition and his fertile and agreeable flow of melody.

Chapu, Henri Michel Antoine, a French sculptor, born in Le Mée, Department of Seine-et-Marne, in 1833; died in St. Germain, near Paris, April 21, 1891. He studied under Tradier, Duret, and Cogniet, gained the *prix de Rome* in 1855, and began exhibiting in 1863 with a statue of "Mercury." In 1875 and 1877 he carried off the first medal. He executed statues for the tombs of Henri Regnault, Leverrier, the Duchesse d'Orléans, and Flaubert. His busts of Théodore Rousseau and Millet are placed on a rock in the forest of Fontainebleau. A work of importance is the monument to M. Schneider at Creusot. Among M. Chapu's Salon exhibits were "The Oath" (1865); "Death of the Nymph Clytie"; "Joan of Arc at Donrémy," in plaster (1870) and in marble (1872); a bust of Dumas the elder for the Odéon (1876); "Thought"; a marble statue of Berryer for the Palais de Justice (1877); "The Genius of Immortality," for the tomb of Jean Reynaud (1880); "Hope" (1889); and a "Danseuse" (1890). M. Chapu was chosen a member of the Institute in 1880.

Chan, Prince, father of the Emperor of China, died in Peking, Jan. 1, 1891. He was the seventh brother of the Emperor Hien Fung, and with the Empress Dowager he carried out the palace revolution by which his infant son was proclaimed Emperor on the death of the Emperor Tung Chi, on Jan. 22, 1875. During his son's minority he performed important functions, and after the Emperor personally assumed the government, contrary to custom, he did not withdraw from all public duties, but held several high offices, the chief of which was the presidency of the Board of Admiralty. He was considered a man of liberal and progressive ideas.

Clam Gallas, Count Eduard, an Austrian soldier, born in 1805; died March 15, 1891. He commanded an army in the campaigns of 1848 and 1849, and for his successes received the Maria Theresa cross. In 1866 he was in command of the division that was overwhelmed by the Prussians at Gitschin, and for this disaster he had to stand a court-martial. Although he was acquitted and received a flattering letter from the Emperor, he was not consoled, and shortly afterward he retired from the army, refusing a pension.

Clam, Martiniz, Count Richard, an Austrian politician, born in 1832; died in Vienna, Nov. 15, 1891.

He was the leading representative of the group of Bohemian territorial proprietors in the Austrian Reichsrath and in the Diet at Prague. A thorough Feudalist and Clerical, he succeeded his more talented brother Heinrich as president of the club of the Bohemian Feudalists in the Diet, and was elected Vice-President of the Austrian Reichsrath. As the head of this group he exercised a great authority in political affairs, although he was not trained to politics but to military life, and took no part in political affairs until he retired from the army in 1879.

Coelho, José Maria Latino, a Portuguese statesman and scholar, born in 1825; died in Lisbon, Aug. 31, 1891. He first followed a military career, and rose to the rank of colonel. Then he gave his attention to mineralogy and geology, and was professor in the Lisbon Polytechnic School till his death. In addition to this, he stood at the head of the critics of Portugal, was permanent secretary of the Academy of Science, and took the chief part in editing the "Dictionary of the Portuguese Language." A member originally of the Liberal party, he discarded monarchial ideas, and by his attacks in the Cortes and the House of Peers on the prerogatives of the Crown, he acquired extraordinary popularity among the Democrats, and was the chosen leader of the Republican party. His critical and historical works and his editorial labors on Portuguese and Spanish newspapers made him pre-eminent among the intellectual leaders of Portugal.

Cogălniceanu, Michel, a Roumanian statesman, born in 1806; died in Paris, July 5, 1891. He was the son of a Boyar family of Moldavia, was educated under French and German tutors, headed the Jassy revolution of 1848, propagated his ideas in exile in Paris and Brussels, and was one of the chief factors in the amalgamation of the Danubian provinces, becoming President of the Council and Minister of the Interior for the first time in 1860. Resigning in the following January, he returned to the post as Prime Minister of united Roumania in 1863, and in May, 1864, in conjunction with Prince Kouza, carried out the *coup d'état* modifying the Constitution established by the Treaty of Paris. In the same year he abolished the *corvée*, secularized the property of the monasteries, deprived the Boyars of their privileges, divided their lands among the peasantry, declared the Church independent of the patriarchate at Constantinople, and by more of such arbitrary acts carried out other liberal reforms. Retiring from the premiership in 1865, he subsequently had charge of the Ministry of Foreign Affairs in 1868, 1876, and 1878, accompanying Joan Brătianu to Berlin to watch over Roumanian interests at the Congress, and was minister to Paris in 1880. He has since been active as a Deputy.

Constant Botelho de Megalães, Benjamin, a Brazilian statesman, born in 1838; died in Rio Janeiro, Jan. 22, 1891. He was the ablest and most devoted of the early Republicans, and while in charge of the Military Academy and Normal School at Rio he implanted his principles in the minds of the young men who were the chief agents in the revolution. The stroke by which Dom Pedro was dethroned was to a great extent directed by him, and in the organization of the Republican Government he was the most energetic and efficient. In the Provisional Government he was first Minister of War, then of Public Instruction, and as such he undertook a renovation and extension of the system of education befitting the new order. Transferred to the Department of Posts and Telegraphs, he carried into it the same reforming spirit, and his large ideas of progress and development were brought to bear on other departments of Government, causing some friction and dissatisfaction among the officials. He was afterward appointed Minister of War, and he held that post till two days before his sudden death. In the Brazilian Constitution it is provided that his house shall be acquired by the state, and preserved as a lasting memorial of the chief founder of the republic.

Coquilhat, Commander O. Vice-Governor of the Congo Free State, born in Belgium in 1853; died in

Boma, March 24, 1891. He was one of the early officers of the International Congo Association, and was the first to plant the flag of the Free State among the cannibal Bangalas, on the upper Congo, who had given Stanley his hardest fight when he descended the river. Going to their country in 1884, he lived alone among these savages for many months, and laid the foundations for the prosperous Bangala station. He initiated them into habits of industry, persuaded them, in a great measure, to abandon their ferocious customs, and after he had been there a year he began to recruit soldiers and laborers for the service of the state, which now has 2,000 Bangala warriors in its army and draws its best steamboat hands and workmen from the same tribes.

Crampel, Paul, a French explorer, born in 1862; died in Central Africa, near the Ubangi river, April 9, 1891. He first went to Africa as secretary to M. de Brazza, Governor of the French Congo, in 1887. In the following year he explored the unknown region between the Ogowe and the Benito and Campo rivers, penetrating the country of the pygmies and making treaties of friendship with Pahouin chiefs, and emerged after severe privations at a French settlement on the coast, bringing back notes and collections, and impressed with the idea of opening up a way from the Congo to the region of Lake Chad, and the rich monarchies of the Soudan. Returning to France, he organized an expedition for this purpose. On Aug. 16 he set out from Brazzaville at the head of a caravan consisting of 5 Europeans, an Arab doctor and interpreter, 30 Senegalese soldiers, and 223 native porters. Advancing toward Baghirmi, he made many treaties. The country of the cannibals was much disturbed, and, after several conflicts, the party was surprised and massacred, with the exception of one Frenchman, and the rear guard.

Curci, Father Carlo Maria, an Italian priest, born in Naples, Sept. 4, 1809; died in Careggi, June 9, 1891. He was the son of a lawyer, who brought him up devoutly, and, joining the Jesuit society at the age of eighteen, he distinguished himself early by his ready pen and fluent eloquence, and obtained a reputation in the order for extensive learning. In 1847 he sprang into celebrity by a comprehensive and incisive answer to Gioberti's attacks on the Society of Jesus, contained in his "Jesuita Moderno," which was not calculated to conciliate the foes of the order. He founded the periodical called "Civiltà Cattolica." Taking a high rank among the intellectual representatives of the Church, he tried to win Pius IX over to a recognition of the new order of things, after the creation of the Italian Kingdom and the seizure of the Papal states. When Leo XIII became Pontiff, his idea of reconciliation had more chance of acceptance in ecclesiastical circles, and he published a plea for peace with the new Italy. The Pope would not let the audacious priest dictate his policy. The book was placed on the proscribed list, and Father Curci, in 1877, was expelled from the Society of Jesus. He made his peace with the Holy See by formally recanting his published views on the temporal power, but remained in retirement in his villa at Careggi, and passed his remaining years in preparing his "Memoirs of his Times" for publication. The completed part, which does not reach the later period of his life, has been published in Florence.

Czartoryski, Prince Constantin Marie Adam, Vice-President of the Austrian House of Lords, born in Passy, near Paris, April 9, 1822; died in Vienna, Oct. 30, 1891. He was descended from an ancient Polish house which once ruled over Lithuania, and was the great-grandson of Constantin Czartoryski, who obtained the intervention of the Empress Catharine in his efforts to establish a liberal system of government, which ended in the dismemberment of the kingdom. The deceased statesman was a life member of the Upper House of the Austrian Parliament, a Privy Councillor, and an influential representative of the Polish aristocracy, which has had a large share in shaping the policy of the monarchy.

Delaunay, Jules Elis, a French painter, born in Nantes in June, 1828; died in Paris, Sept. 5, 1891. He studied under Lamoignon and Flandrin; won the *prix de Rome* in 1856, and on his return to Paris began to exhibit a series of works that have placed him in the highest rank of modern painters. Of these, "The Communion of the Disciples" and "The Plague at Rome" are in the Luxembourg. His portraits, notable among which are those of Madame G. Bizet, Charles Gounod, the actor Regnier, Gen. Melinet, and Henri Meilhac, are masterpieces in this branch of the art. He entered the Academy of Fine Arts in 1879. He was very successful in decorative art, and his work is found in the Pantheon, the Hotel de Ville, the Opera, and the Sainte Trinite and other churches in and out of Paris. In 1881 appeared his remarkable illustrations to La Fontaine. In 1890 he exhibited in the Salon a portrait of Cardinal Bernadou, Archbishop of Sens.

Depeyre, Octave, a French politician, born in Cahors in 1812; died in Paris, Sept. 29, 1891. He was a lawyer by profession, and under the empire he rose to be Minister of Justice, and in that position gave many evidences of his intolerance. Under the republic he was a candidate for life Senator, and, being defeated, was chosen by a coalition of Bonapartists and Royalists to a nine years' seat, which he lost on the expiration of the term in 1879. Since then he has devoted himself to the interests of the Catholic University in Paris as a member of the executive board of directors, and to the defense of extreme Conservative ideas as political editor of the "Moniteur Universel."

Devonshire, William Cavendish, Duke of, born April 27, 1808; died in Milnthorpe, Dec. 21, 1891. He was the son of Lord William Cavendish, and in 1858 succeeded his cousin, sixth Duke of Devonshire, becoming head of the greatest Whig family of the British aristocracy. He married in 1829 Lady Blanche Howard, daughter of the Earl of Carlisle, who was related to him through her mother. His eldest son, born July 23, 1833, is Spencer Compton Cavendish, the Liberal statesman known under his title, Marquis of Hartington, who succeeded to the dukedom on the death of his father, and therefore was compelled to give up his position as leader of the Liberal Unionists in the House of Commons. The second son, Lord Frederick Cavendish, was murdered in Dublin by the Fenians in 1882. The late duke went to the University of Cambridge at the age of eighteen and was graduated with high honors, both in classics and mathematics. From 1829 till 1881 he represented the university in the House of Commons. In 1884, on the death of his grandfather, Lord George Cavendish, the first Earl of Burlington, he entered the House of Lords. He never took a prominent part in party politics or in the debates of the House of Lords. Subjects connected with physics and mathematics occupied much of his attention. His chief claim on public attention was through his vast industrial enterprises. The Cavendishes held large estates in the eastern counties in the time of the Plantagenets. Sir William Cavendish was raised to the peerage in 1605 as a baron, and created an earl in 1618, and the fourth earl was made a duke by King William in 1694 for political services. The property of the Dukes of Devonshire is one of the greatest in England, comprising 143,500 acres in Derbyshire, Lancashire, Sussex, and the south of Ireland, besides the greater part of the town of Eastbourne. The late duke formed large business plans before the possession of the family estates gave him the capital to carry them out. Through him was created the busy manufacturing and shipping town of Barrow-in-Furness. Eastbourne, the model watering-place, was also built up by his efforts. One of the greatest iron masters in Great Britain, he was chosen the first President of the Iron and Steel Institute.

Dolgorukoff, Prince Vladimir, a Russian administrator, born in Moscow, July 3, 1810; died in Paris, July 1, 1891. He was the head of one of the wealth-

jest and most distinguished families of the higher Russian aristocracy, and for many years was a soldier and served with honor in the Caucasus. After his retirement from the army he served the Czar Nicholas in delicate missions, was made Master of Provisions, was a member of the Council of War during the Crimean campaign, and in 1856 he was appointed Governor of Moscow, a post that is always held by a trusted confidant of the Czar. The expenses of this great station impaired his immense fortune, compelling him to borrow from Jewish bankers. When the recent Antisemitic troubles came on, and orders were issued for the removal of Jews from the interior to the Pale on the western frontier, he treated the Jews of Moscow with a leniency that drew on him the censures of the Nationalist party at the court and led to his dismissal in November, 1889, and the appointment in his place of the Grand Duke Sergius.

Dominis, John Owen, husband of Queen Liliuokalani of Hawaii, and Governor of Oahu, born in the United States; died in Honolulu, Aug. 27, 1891. He was appointed Governor of Oahu and Maui after his marriage to the Princess Liliuokalani, and was confirmed as governor of the former island, where the capital is situated, after her accession, on Jan. 20, 1891.

Dupuis, Adolphe, a French actor, born in 1825; died Oct. 25, 1891. He was one of the favorite actors of the Gymnase company, playing in an easy and natural manner and in a familiar, conversational tone of voice. He was one of the best interpreters of the rôles of Dumas *filis*, and was liked in the whole round of modern society dramas, but in the classical repertoire his efforts were not successful, and for this reason he was never called into the Comédie Française company. He went to the Vaudeville in 1878, and played with great applause in Brussels and St. Petersburg.

Dupuy, Antoine, a French historian, born in 1836; died in Brittany, July 22, 1891. He was the author of works on French history, chief of which is "Histoire de la Réunion de la Bretagne et la France."

Emine, Nikita Ossipovich, an Armenian historian, born in Djulfa, near Ispahan, Persia, about 1815; died in Moscow, Jan. 7, 1891. He was the son of wealthy parents, who sent him to Calcutta to be educated. Concluding from a catalogue that fell into his hands that the course of the Lazareff Institute for Oriental Tongues, in Moscow, was more complete than the similar schools in Calcutta afforded, he went to Russia, passed through the Lazareff Institute, and then the University of Moscow, in which he was one of the most brilliant students, and continued to reside in Moscow, where he was recognized as an illustrious scholar. Russian learning is indebted to him for many works, especially the translation into Russian of all the Armenian historians. In other countries he became known through his great work in French on the "History of Armenia."

Emmerich, Robert, a German composer, born in 1836; died in Stuttgart, July 11, 1891. He was director of the Choral Union of Stuttgart, and composed, besides other music, several operas, the most successful of which was "Der Schwedensee."

Fabrice, Gen. Georg Friedrich Alfred, Count von, Minister of War to the King of Saxony, born in Quesnoy, France, in 1818; died in Dresden, March 25, 1891. He was the son of a major in the Saxon army, whose regiment formed part of the army of occupation in France at the time of his birth. Trained for the military profession, like most of the men of his family, he rose to high rank, and when the Schleswig-Holstein campaign in 1863-64 called the Saxon army into action he acted as chief of staff; and again in the Bohemian campaign of 1866. Next he was made Minister of War, and during the Franco-German War he commanded the military district of the 12th Army Corps. During the occupation he was Governor of Versailles, and in June, 1871, he was reappointed Saxon Minister of War. In 1872 he was made General of Cavalry. He became Prime Minister in 1876, and in 1882 added to his other duties those of Minister of Foreign Affairs. He was created a count in 1884.

Faccio, Frano, an Italian musician, born in Verona, March 8, 1840; died in Monza, July 23, 1891. He was the son of a hotel waiter. Entering, in 1855, the Conservatory at Milan, he applied himself with such diligence that in a short time he became a good pianist, and composed meritorious pieces, some of them in collaboration with Arrigo Boito, who was a fellow-student. After traveling abroad for his improvement he wrote the music to the opera of "I Profumi Fiammenghi," and subsequently "Amleto" to a libretto by Boito. In 1872 he became leader of the orchestra of La Scala, and since the death of Mariani he has enjoyed the highest reputation of any orchestral leader in Italy. In 1889 he conducted the studies and arranged the *mise en scene* for the production of Wagner's "Meistersänger" at La Scala.

Félix, Celestin Joseph, a French preacher, born in Neuville, July 28, 1806; died in Lille, July 7, 1891. He was a farmer's son. He studied in the seminary at Cambrai; took holy orders, and at the age of twenty-seven joined the Society of Jesus. He began his career as a preacher in the Church of St.-Thomas d'Aquin; went from there to St.-Germain des Prés, and from 1853 till 1871 preached in the Cathedral of Notre Dame. He left the pulpit to devote himself to authorship, having already completed his great work entitled "Progrès par le Christianisme" and his "Jésus Christ et la Critique Nouvelle." The most celebrated of his other publications are essays on "Socialism and Society" and "Patriotism." For many years he was superior of the Jesuits' college at Lille.

Fothergill, Jessie, an English novelist, born in Manchester in 1856; died in London, July 30, 1891. She began writing at an early age, and "The First Violin," her best known work, was published in 1878. As a musical novel it is almost as celebrated as "Charles Ancherster." Other works of hers are: "Probation," "The Wellfields," "One of Three," "Made or Marred," "Kith and Kin," "Peril," "Healey," "Borderland," "The Lassies of Leverhouse," "From Moor Isles," and "A March in the Ranks" (1890).

Foucher de Careil, Count Louis Alexandre, a French diplomatist and author, born in Paris, March 1, 1826; died there, Jan. 10, 1891. He was the son of a French general descended from an ancient Breton family, and from him he inherited great wealth and large estates in the Department of Calvados. After a brilliant course at the university in Paris and travels in America and the Orient he gave himself up to literary and philosophical studies, and delivered lectures in Paris and published treatises on Leibnitz, Spinoza, Hegel, and Schopenhauer. His lectures were interdicted by the Imperial Government. He also took part in Catholic congresses, and was an unsuccessful candidate for the Corps Législatif in 1866 and 1869. During the Franco-Prussian War he superintended the ambulance service, for the Breton legions. Accepting the republic, he was appointed prefect of Côtes-du-Nord by President Thiers, and in May, 1872, was transferred to the prefecture of Seine-et-Marne. For this department he was elected Senator on Jan. 30, 1876, and with the Republican minority opposed the De Broglie ministry. On Aug. 8, 1888, he succeeded Count Duchatel as French ambassador at Vienna. His fortune enabled him to exercise a splendid hospitality in this post, which he resigned on June 26, 1886, on account of the decree of banishment issued by the De Freycinet ministry against the families that formerly reigned in France. A few days before his death he was re-elected Senator. He worked for many years on a new edition of Leibnitz's works, which he left unfinished, and in addition to his numerous essays on the philosophers he published books on Goethe and Dante and on political and social questions, and in 1868 and in 1875 two important treatises on workmen's dwellings and public buildings.

Fowler, Sir Robert Nicholas, an English politician, born in Tottenham, Sept. 14, 1828; died in London, May 22, 1891. He was of Quaker parentage, the only son

of a London banker, and was educated in University College, London, where he took his baccalaureate degree with high honors in 1848. He traveled in India and the British colonies, and then entered his father's banking house of Dimsdale, Fowler & Co., of which he was the senior partner until it consolidated with a kindred business recently and became Prescott, Dimsdale & Co. In 1865 he offered himself as a Conservative candidate for the city of London, which was then represented by four Liberals. He represented the Cornish boroughs of Penryn and Falmouth from 1868 till 1874, when he was defeated. In 1880 he was chosen as one of the four city members, and when the representation was reduced to two members he and Mr. Hubbard were returned, and he remained the senior member for London till his death. He was chosen alderman for the ward of Cornhill in 1878, was sheriff of London and Middlesex in 1880-'81, and in November, 1883, owing to some dissatisfaction with the alderman whose turn it was, he was unexpectedly elected Lord Mayor. His mayoralty was signalized by the number of entertainments that he gave, and still more by the discontinuance of the official attendance at St. Paul's and other forms and ceremonies connecting the municipal government exclusively with the state Church. Although a Churchman himself, he preached on Sundays in various dissenting places of worship. A few months after the expiration of his year of office, his successor having died, he was again elected by the Court of Aldermen, and after his double mayoralty he was made a baronet. He made a long visit to Australia and New Zealand, and after his return he resumed his active and zealous parliamentary career. In the proceedings of the House of Commons he took a prominent part, although he rarely made a set speech, except when the antiquated privileges of the livery and corporation were attacked, or when slavery or the protection of aborigines or other philanthropic objects with which he identified himself came under review, or when the opium question came up, or any of the Indian or colonial subjects that he had taken for his peculiar field of study were under discussion. He was, apart from his chosen hobbies, a thorough party politician, and did good service for the Conservatives by his parliamentary fencing. His part as senior representative of the city of London he performed with tact and dignity, winning the esteem of all parties. The narrative of his early travels he published under the title of "A Tour in Japan, China, and India" (London, 1876).

Freppé, Charles E., a French prelate and statesman, born in Obernai, Alsace, in 1827; died in Paris, Dec. 22, 1891. After receiving priest's orders he became Professor of Sacred Eloquence in the theological faculty at Paris, was Lenten preacher at the Tuileries in 1862, and canon of Notre Dame afterward. Called to Rome in 1869 to prepare documents to submit to the Council on the question of infallibility, he was nominated Bishop of Angers at the end of that year. He was selected as a Legitimist candidate in Finistère after the defeat of MacMahon, and was already a conspicuous public man, one of the most widely known of French ecclesiastics, when the voters of Brest in 1880 elected him to the Chamber of Deputies. At the time when peace was concluded he addressed an open letter to the King of Prussia, protesting as an Alsatian against the annexation of his native province. He entered into a controversy with Renan when the latter's "Life of Jesus" was published. In the Vatican Council he defended passionately the doctrine of Papal infallibility. On his first entrance into the Chamber the Right would have him addressed as "Monseigneur" and the Radicals as simply "Monsieur." M. Floquet found a middle way by saying, "*Monsieur l'Évêque Freppé à la parole.*" The disputatious representative of the Church militant caught the ear of the Chamber without difficulty, and at once took his place as the principal leader of the Clerical forces. He was listened to eagerly by all parties because he was a

fascinating orator, a man of comprehensive culture, an earnest patriot, and almost the only one of the Chauvinistic advocates of revenge who was thoroughly familiar with Germany and German conditions. His speeches sparkled with wit and imagination, and were full of impassioned passages. He was a master of the oratorical art, and in debate no one was more ready or more cutting in his retorts, which were free from sting and always delighted the Chamber with their impromptu wit. Among his numerous published works, besides those already mentioned, are a book on the apostolic fathers and their epoch, one on Christian eloquence in the second century, one on the Christian apologists of that epoch, and a panegyric of Joan of Arc.

Gladstone, William Henry, an English politician, born in 1840; died in London, July 4, 1891. He was the eldest son of William E. Gladstone, and received his education at Eton and Christ Church, Oxford, where he took honors in classics. From 1869 till 1874 he was a Lord of the Treasury, having represented Chester in Parliament from July, 1865, till December, 1868, and Whitby from that date. In April, 1880, he was returned for East Worcestershire, and sat for that constituency till the next dissolution. His father, having become owner of Hawarden in 1874, conveyed it to his son in 1876, and as landlord of this property, covering four square miles, with a rent roll of £18,000 and valuable minerals underlying it, he served on the commission of the peace and for one term as sheriff of Flintshire.

Gontcharoff, Ivan Alexievitch, a Russian novelist, born in the government of Simbirsk in 1823; died in St. Petersburg, Sept. 27, 1891. He attained a great success with a novel called "An Ordinary Story" in 1858, which he followed up with "Oblomon" in 1859. A third work giving graphic pictures of Russian life in a pure and vivid style is "The Fall," published in 1870. As a commissioner in the voyage of the frigate "Pallada" in 1852-'54 he wrote a narrative of the circumnavigation of the globe.

Goodwin, Harvey, an English clergyman, born in King's Lynn in 1818; died in York, Nov. 25, 1891. He was the son of a solicitor, was educated by private tutors, entered Caius College, Cambridge, in 1836, was graduated as second wrangler in 1840, was elected a fellow, and was a tutor in his college, taking priest's orders in 1844, till 1848, when he was presented to the living of St. Edward's, Cambridge, where his sermons, characterized by what came to be known as "muscular Christianity," drew large congregations. In 1858 he was appointed Dean of Ely, and in 1869 he succeeded Dr. Waldegrave as Bishop of Ely. He was able to preach to working men and other popular audiences with more effect than his fellow-bishops, was a frequent speaker in the House of Lords, and in all practical questions of the day his influence was felt. He was a distinguished mathematician, and published a "Course of Elementary Mathematics" and treatises on statics and dynamics.

Graetz, Heinrich, a German Jewish historian, born in Xions, Posen, Oct. 31, 1871; died in Munich, Sept. 7, 1891. He studied Hebrew in his native town, was sent to the gymnasium at Oldenburg, and thence went in 1840 to the University of Breslau, where he was graduated in 1844. Two years later he published "Gnosticism and Judaism," and in 1853 was appointed Professor of Biblical Exegesis and Jewish History in the Hebrew seminary at Breslau. The Prussian Government sent him on a journey of exploration in Asia Minor and Egypt in 1872, and from the documents that he discovered he collected material for his great work on the "History of the Jews." He was a prolific writer and the editor of the "Monatsschrift für Geschichte und Wissenschaft des Judenthums."

Gravenreuth, Freiherr Carl von, a German colonial officer, born in Regensburg, Dec. 12, 1858; died in Buku, Cameroons, Oct. 19, 1891. The son of a Bavarian court official, he entered the army in 1877, and was commissioned 2d lieutenant in May, 1879. He

was one of the first German military officers to go to Africa, entering the service of the German East Africa Company in 1885. He was one of Major Wissmann's most trusted lieutenants, and was sent to Berlin to act as his representative, returning to Africa in 1890 to take a prominent part in the military operations for the suppression of the revolt of the coast tribes until he was forced by failing health to go back to Germany. There he was promoted to the rank of captain in September, 1890, and was employed in the Ministry of Foreign Affairs until in the beginning of the summer of 1891 he went out to Cameroons to explore the interior and lead a punitive expedition against the Abo tribe in the south. In storming their chief village, on the Sannaga river, he fell at the head of his black soldiers.

Granville, Granville George Leveson-Gower, Earl, an English statesman, born in 1815; died in London, March 31, 1891. After getting his education at Eton and Oxford he served a short apprenticeship in 1836 with his father, then minister at Paris, who was a

younger son of the Marquis of Stafford and who had been raised to the peerage for distinguished diplomatic services in 1815. Elected member of Parliament for Morpeth in 1837, he was made Under Secretary for Foreign Affairs in 1840, but was ousted before he became familiar with the duties of the office through the breaking up of the Melbourne ministry. Losing his seat, in 1841 he was returned for Lichfield, and made himself conspicuous by his vigorous

championship of free trade. In 1846 the death of his father transferred him to the more confined arena of the Upper House. He was made Master of the Royal Buckhounds and was more thought of as a courtier and dandy than as a serious politician. John Bright and other active Liberals raised a vigorous protest when Lord John Russell appointed the young aristocrat President of the Board of Trade in 1848. Lord Granville soon convinced them of his business capacity and energy. As Vice-President of the Commission for the International Exhibition a couple of years later he won golden opinions of all men, and especially charmed the French visitors by his graceful courtesy, thus helping to cement the *entente cordiale*. In 1851 he had a fleeting experience in the field of his true vocation as Minister of Foreign Affairs for a few months in the place of Lord Palmerston, whose independent course in recognizing Napoleon's *coup d'état* had given offense to Lord John Russell. In 1859, on account of the jealousy between the same two statesmen, Lord Granville was sent for by the Queen, but was saved the awkward task of forming a stop-gap ministry by Lord John Russell's consenting to serve under Lord Palmerston. He was chairman of the Royal Commission of the Exhibition of 1862, and was appointed Lord Warden of the Cinque Ports in 1865. When Mr. Gladstone formed a ministry in 1868 he was made Minister of the Colonies, and it fell to him to sanction the transfer to Canada of the Hudson Bay territory. It was his part also to defend the Irish Church bill and Mr. Gladstone's first land bill in the House of Lords, and in the debates he developed an unexpected power of lucid exposition and practical reasoning. The death of Lord

Clarendon brought him at last into the Foreign Office at the difficult juncture when the outbreak of the Franco-German War upset the European balance of power. His determination to maintain the neutrality of Belgium led to the confirmation of the agreement of 1839 by a new one between England, France, and Prussia. Refusing at first to consent to Russia's repudiating her engagement not to maintain a naval force on the Black Sea, he was constrained to agree to the abrogation of the treaty by a conference of the powers. In defending England against charges of violating the neutrality laws brought by both belligerents, he showed skill in the subtleties of diplomatic reasoning. When the vanquished French appealed for active intervention, he used his good offices to arrange an armistice, protested against the bombardment of Paris, and exerted himself to bring about a conference between M. Thiers and Count Bismarck. In 1872 he had to arrange the terms of a new commercial treaty with France. He firmly refused to allow the indirect claims to go before the Geneva arbitrators of the Alabama question; but the outcome of the arbitration was nevertheless regarded as a humiliating defeat to English diplomacy. His opponents charged him with weakness, too, when Russia disregarded his protests concerning Khiva and Afghanistan. The Conservatives returned to power on Feb. 21, 1874, and for the next six years it was Lord Granville's part to criticise the Earl of Beaconsfield's imperial policy and to defend his own more cautious and pliant methods. When the Liberals won the elections of 1880 the first consulted with him because Mr. Gladstone had ostensibly resigned the leadership after the defeat of 1874; but it was Mr. Gladstone that the country wanted, and Lord Granville returned to the Foreign Office. The Liberals had scored oratorical triumphs while in opposition by deriding and denouncing Lord Beaconsfield's imperial foreign and colonial policy and exposing its folly and danger, yet as soon as they attempted to reverse it and pursue a purely domestic policy, on the old Liberal principles of peace, retrenchment, and reform, they found themselves at war with the tendency of the time and the dominant forces of English opinion; for the public mind, dazed and disturbed at first by Beaconsfield's startling performances, became more convinced of the glory and success of his bold assertion of England's strength, and demanded that his successor should not sacrifice the position that he had achieved. The Cabinet was caught in the eddies of conflicting currents, and its members were divided in opinion on foreign questions. Its external policy was therefore confused, inconstant, and vacillating, and Lord Granville, whose diplomatic suppleness and dexterity were devoted to harmonizing discordant elements at home, brought English diplomacy into contempt abroad, and involved the country in more estrangements, difficulties, rebuffs, diplomatic failures, and losses of blood and treasure than the spirited policy of his predecessor had done. The Boer War was not of his seeking, and in making peace he followed the settled lines of Liberal policy in South Africa that had already received the approval of the country, only to find that the fickle public, dazzled by the dreams of imperialism, deemed it a disgrace to scuttle after the Majuba Hill disaster to British arms. The effect of this verdict was seen in the confused record and inexplicable vacillations of the divided Cabinet during the course of the Egyptian difficulty. First acting with France in the joint note, then bombarding Alexandria in order to leave France in the lurch, then winning the cheap glory of the Tel-el-Kebir campaign, suppressing the *de facto* government and seizing the country under specious pretenses, the broken pledges of evacuation, and the whole history of hypocrisy and deceit, are only explained by the exigencies of party politics and the discords of the Cabinet. The shameful record of the Soudan difficulty, ending with the sacrifice of Gen. Gordon and the retreat of the British, and then the perplexities of the Suez Canal question and the open

breach with France on the subject of the reduction of the interest on the Egyptian debt, were not due to Lord Granville's weakness, but rather showed his courage in shouldering the blame for the errors of a distracted Cabinet striving to steer through parliamentary crises and hold the inharmonious elements of the party together. Prince Bismarck, who spoke with undisguised contempt of Lord Granville's foreign policy, which he made his standing illustration of the follies of parliamentarism, prepared new difficulties for the British Cabinet after it had shown its complaisance in regard to Angra Pequena and Cameroons, and Earl Granville found his ingenious pleas and diplomatic refinements unavailing when the angry colonists of Cape Colony and Australia accused him of sacrificing their interests to the Germans on the southeast and southwest coasts of Africa and in New Guinea and to the French in the New Hebrides. The cry was echoed in Great Britain, and to avoid the reproach Lord Granville was compelled to take up an imperial policy of action. The Penjdeh surprise, which nearly precipitated a war with Russia, brought his difficulties to a climax, and in consequence the ministry invited an adverse vote on a financial issue and thus deliberately handed over the Government to the Conservatives in order that they might guard the interests of England by their approved methods. In the following year, 1886, Mr. Gladstone was again Premier for six months, but Lord Granville took the Colonial Office, letting Lord Rosebery administer the foreign policy in a way more in harmony with imperialist ideas. Although he was *persona non grata* to the colonists, his administration led to no new difficulties. Lord Granville retained his position of Liberal leader in the House of Lords to the end of his life, and amid all the perplexities of his party, whether in office or in opposition, his patience, assiduity, good temper, unflinching tact, and ready wit, smoothed away many difficulties that arose for the Liberals.

Green, Sir William Kirby, an English diplomatist, born in Nauplia, Greece, in 1836; died in Morocco city, Feb. 25, 1891. Members of his family have held British consular posts in the Levant for generations. His father was Sir John Green, for many years consul-general at Bucharest. The son was educated in the East, and in 1856 became secretary to the consul-general for Egypt. In 1859 he became secretary to Sir John Drummond Hay, envoy to Morocco, and for ten years he filled a variety of consular posts in that country. Going to Tunis as acting consul-general in 1869, and thence to Damascus, Beyrout, and Scutari in succession, he was appointed in 1879 consul-general to Montenegro. During the agitation of Bulgarian atrocities and the Eastern question he maintained in his reports, in common with other consular officials, that the troubles were due as much or more to Christian misdeeds as to faults of the Ottoman Porte or Turkish governors, and thus his name came frequently before the public. In 1886 he succeeded Sir John Drummond Hay as minister to Morocco and consul-general at Tangier. His knowledge of Oriental languages was unsurpassed, and his early familiarity with Arab life and character and the diplomatic methods of the Moors enabled him to extort various concessions from the Sultan. He died suddenly while carrying out a special mission to the Moorish court.

Gregorovius, Ferdinand, a German historian and poet, born in Neidenburg, East Prussia, Jan. 19, 1821; died in Munich, May 1, 1891. The son of a legal magistrate whose ancestors, of Polish descent, had been Protestant clergymen for several generations, he studied first theology in the Königsberg University, and from this turned to literary history and philosophy, and to the life of past ages vividly impressed on his mind by the old castle of Neidenburg restored by his father and by the historical traditions of Poland. His first essay in literature was the romance "Werdomar und Wladislaw aus der Wüste der Romantik" (1845). His sympathy for the unhappy Poles impelled him to write a book on the sorrows and

hopes of their nation entitled "Die Idee des Polenthums," which he intended to follow up with a larger work on Poland. The aspirations of the Magyars also attracted his sympathy, and in 1849 he published a book on Hungary. In a critical analysis of Goethe's "Wilhelm Meister," published in the same year, he unfolded his own social philosophy. Soon he was found immersed in the study of Roman times. In 1851 he published a history of the Emperor Adrian and his epoch and a tragedy on the "Death of Tiberius." In 1852 he wandered over Corsica in the summer and in the winter he made his first visit to Rome. For many years he lived in Italy, and in later life, after 1875, alternately in Rome and in Munich. Making himself familiar with every spot in Rome and its vicinity and in all parts of Italy, he introduced the method of presenting scenes of history with graphic detail in their proper landscapes. His descriptive talent, as well as his skill in antiquarian and historical research, was revealed in his book on "Corsica," first published in 1854, which in the enlarged edition (1869) is a complete monograph on the island and its people, and their customs, ballads, and dirges. In 1856 he issued a translation of the poetry of the popular poet of Sicily, Giovanni Meli, and the poem "Euphron," depicting the destruction of Pompeii. His first work on Rome was a little book describing the tombs of the Popes, with historical comments. The most admired of all his works is the "Wanderjahre in Italien," describing the scenery and life of Italy and the historical associations of every locality, of which the first volume appeared in 1856 under the title of "Figuren: Geschichte, Leben und Scenerie aus Italien." The most learned is his "Geschichte der Stadt Rom im Mittelalter," relating the history of Rome from its conquest by the Visigoths to its occupation by the soldiers of Charles V. The first two volumes of this great work were published in 1859, and the third in the following year; the eighth and last in 1872. It combines the history of the city and its people with that of the Papacy. After its completion he published an historical biography, "Lucrezia Borgia," clearing away some of the fables connected with her by the aid of documents discovered in Mantua and Modena. The fifth volume of his "Wanderjahre," dealing with Apulia, appeared in 1877. In 1880 he edited the letters of Alexander to Wilhelm von Humboldt, after which he undertook a journey to Greece and the Orient. A monograph on "Athenais" and historical and descriptive sketches of Athens, Corfu, Palestine, and other places, a collection of which was published in two volumes in 1887-'88, were only introductory to his second important work, "Geschichte der Stadt Athen im Mittelalter" (2 vols., 1889).

Grimwood, Frank St. C., an Anglo-Indian official, born in England about 1855; died in Manipur, March 25, 1891. He was educated at Winchester school and Merton College, Oxford, and was appointed to the Indian service after passing the open examination in 1874. He was employed as a district officer in Bengal and Assam, and finally was sent to Manipur as political agent. Living there with his wife apart from all European companionship, he abandoned the stiff demeanor usually observed by Englishmen in their relations with natives, and entered into friendly social intercourse with the members of the reigning family, who fill all the principal posts in the Government at Manipur, and especially with the Senaputty. For this reason his advice was disregarded by Mr. Quinton, his superior, who came to depose the Senaputty, and thus resulted the catastrophe in which both lost their lives.

Hare, Thomas, an English political writer, born in 1806; died in London, May 6, 1891. He was called to the bar in 1833, acquired an equity practice, and published reports and treatises dealing with this branch of the law. In 1853 he became a charity inspector. A pamphlet on "The Machinery of Representative" attracted so much attention in 1857 that the author devoted himself to the preparation of a

larger work, which appeared in 1859 under the title of "The Election of Representatives, Parliamentary and Municipal," more familiarly known as "Hare on Representation." In it he unfolded a scheme of preferential and proportional representation, designed to secure the separate representation of various interests and give minorities a proportional voice in governing bodies, which gained and still has advocates in many countries.

Haussmann, Baron Georges Eugène, a French administrator, born in Paris in 1806; died there, Jan. 11, 1891. His father served under Napoleon in the commissariat department, was made a baron, and became a journalist and writer on agriculture. The son studied in the Conservatoire with the idea of becoming a singer, afterward qualified for the bar, and then entered the civil service; was a subprefect at Nérac and other places from 1833 till 1848, then prefect successively of the Var, the Yonne, and the Gironde, and in 1853 was made prefect of the Seine and transferred to Paris, where he planned and carried out vast works for the sanitation, betterment, and embellishment of the capital, including the improvement of the Bois de Boulogne and the park of Vincennes, the establishment of public gardens, the prolongation of the Rue de Rivoli, the cutting of new boulevards, the construction of barracks, churches, bridges, fountains, theatres, the new opera house, etc. Besides these splendid works he transformed the system of sewers and water supply, the hospitals and asylums, and the markets and slaughter-houses. He was first called to Paris as a partisan of Louis Napoleon, for whom he had prepared an enthusiastic reception when prefect at Bordeaux. As soon as he was installed in the Hôtel de Ville he sent for M. Alphand, an engineer at Bordeaux, who worked out in technical detail his gigantic scheme for rebuilding Paris. The Emperor authorized the enormous expenditure, and entered heartily into Haussmann's plans, and the public bore the heavy burdens willingly. Nothing did more to make the empire popular than the splendors of the new Paris, which were imitated in other cities. The transformation was not accomplished without doing violence to private rights and public laws. Still, the illegalities and irregularities of the expedients were condoned until the empire lost its prestige. Jules Ferry's pamphlet entitled "Comptes Fantastiques de M. Haussmann" (1868), a parody on the "Comptes Fantastiques de Hoffmann," was a telling diatribe against the financial jugglery. The Cour des Comptes objected to some of his devices, forcing M. Haussmann to request that the Paris budget be submitted to the Chamber, and when M. Ollivier formed a Liberal ministry in January, 1870, he was dismissed, since he refused to resign. He enjoyed a pension of 6,000 francs for the rest of his life. His popularity long outlasted the empire. He was a Senator from 1857 till the fall of the Empire and a Bonapartist Deputy for Corsica from 1877 till 1881. In 1871 he was appointed director of the Crédit Mobilier, and did much to restore the credit of that concern.

Hawkshaw, Sir John, an English engineer, born in Leeds in 1811; died in London, June 2, 1891. He was a pupil of Alexander Nimmo, and in 1831 he went to manage the Bolivar copper mines in South America. Returning to England at the end of three years, he became engineer of the Manchester and Bolton canal and railway, and constructed nearly the whole of the system, now the Lancashire and Yorkshire. So early and great a success led to his being associated with many important undertakings. His chief work was the Severn tunnel, which was thirteen years under construction and would have been abandoned on account of the constant and copious inflow of water by any engineer less ingenious and persevering. He was President of the Institution of Civil Engineers in 1862-'63, was knighted in 1873, and presided over the British Association at Bristol in 1875. In 1870 he first broached the project of a Channel tunnel. The Penarth harbor and dock in Cardiff Roads, the Londonderry bridge, the line of railway between Charing

Cross and Cannon Street with the two bridges across the Thames, the East London Railway, the Albert Dock at Hull, and the foundation of the new forts at Spithead are among Sir J. Hawkshaw's many memorable works in England; while of those which he constructed elsewhere the most important are the Riga and Düna burg and the Düna burg and Witepsk railways in Russia, the Government railways in Mauritius, and the great ship canal from Amsterdam to the North Sea.

Haynald, Ludwig, a Hungarian prelate, born in Szeeseny, Oct. 3, 1816; died, July 4, 1891. He was brilliantly accomplished and held a high rank in Hungary, not only as an ecclesiastic, but as a statesman, a diplomatist, an orator, a scholar, and an author. Becoming Bishop of Siebenbürgen in 1852, he had a conflict with the Austrian Government in 1862 over the question of reorganizing a separate Transylvanian Diet, and as he persisted in declaring it unconstitutional he was deposed and went into exile, being appointed by the Pope Archbishop of Carthage. When dualism was established in 1868 he returned to Hungary, and soon afterward was made Archbishop of Kalocsa, one of the very wealthy sees. In 1869 he acquired European notoriety by opposing in the Roman Council the doctrine of infallibility. He was created a cardinal on May 12, 1879. He gave largely out of his revenues for charitable and educational purposes, established the Haynald fund for the advancement of science and literature, which has expended 5,000 florins for endowments, and gave to the National Museum his library and celebrated herbarium. Cardinal Haynald was Tisza's confidential adviser in ecclesiastical affairs and an intermediary in delicate negotiations with the Vatican and the court at Vienna. He presented ten times over the Hungarian delegation.

Hennessy, Sir John Pope, an Irish administrator and politician, born in Cork in 1834; died in Youghal, Oct. 7, 1891. He was the son of an Irish landlord, and was educated at Queen's College, Cork, and called to the bar in the Inner Temple in 1861. Two years later he presented himself on an original platform, calling himself a Catholic Conservative, to the constituency of King's County, and was elected to Parliament. He was an active and efficient supporter of the Conservative party, and moreover interested himself in the mines' regulation bill and other philanthropic measures, proposed the reclamation of bogs for the benefit of the poor of Ireland, and earned the gratitude of the Catholic, by carrying through the prison ministers' bill. On English Church questions he supported the Government, while attacking the system of national education introduced into Ireland. His rebellion against party discipline in this and other matters led to his being relegated to the colonial service. He was sent first to administer Labuan, and from there to West Africa, a year later to the Bahamas; and thence to the Windward Islands. Sent next to Hong-Kong, where his sympathy for the natives got him into trouble with his superiors, who transferred him to Mauritius with still more awkward consequences. Espousing the cause of the Catholic French creoles, he became involved in a conflict with Clifford Lloyd, his secretary, and Sir Hercules Robinson, who was sent to arbitrate, gave him a nominal but not a real justification. Retiring on a pension he returned with health broken by his long residence in tropical climes, but his old restless thirst for action, and soon plunged into the Irish muddle by accepting the Clerical Anti-Parnellite nomination for North Kilkenny. He was elected by a majority of two to one, but took little part in the debates of Parliament.

Inglis, John, a Scottish jurist, born in Edinburgh in 1810; died at his country seat near that city, Aug. 20, 1891. He was the son of a Presbyterian divine. After passing through the Edinburgh High School, he went to the University of Glasgow, and thence to Balliol College, Oxford, where he was graduated B.A. in 1834 and M.A. in 1837, having in the mean time been admitted, in 1835, to the Scottish bar. He rose with great rapidity, and in 1852 his rank was such that he

was made Solicitor-General and afterward Lord Advocate. In 1858 he was restored by the Conservatives to the post of Lord Advocate and entered Parliament as a member for Stamford. He secured the passing of the Scottish universities act of 1858, and was chairman of the committee appointed to bring the new system into operation. He was raised to the bench in 1858 as Lord-Justice Clerk, and in 1867 was appointed Lord-Justice General. In the twenty-two years during which he presided over the Court of Session he added to the reputation of Scotch justice by his grasp of legal principles and his exact and comprehensive knowledge of law. His decisions are cited as high authority in British courts.

Janssen, Johannes, a German historian, born in Xanten, Rhenish Prussia, in 1829; died in Frankfurt, Dec. 24, 1891. His principal work was a "History of the German People before the Reformation," in which he attempted to refute the Protestant historians of Germany by showing that the Germans were prosperous and happy, and rapidly advancing in civilization, until the ecclesiastical revolt of the Reformation, and the chaotic moral and intellectual conditions that resulted from it interrupted the movement.

Kalakaua I, David, King of Hawaii, born Nov. 16, 1836; died in San Francisco, Jan. 30, 1891. He was the eldest son of Kapaaua and Keohokaloale, niece of

Kamehameha I, and was elected to the throne by the Hawaiian Parliament to succeed Lunalilo I, on Feb. 12, 1874. He was of pure Hawaiian blood, and sprang from a collateral branch of the ancient royal family. He was an intelligent and progressive ruler, who was popular and able to guide the country until his fondness for pleasure caused him to neglect his duties and involved him in pecuniary difficulties. A revolutionary movement in 1887 resulted in his granting a new Constitution which curtailed the royal prerogative.

Keene, Charles S., an English comic artist, born in Hornsey, in 1823; died in Hammersmith, Jan. 4, 1891. He received his education in the grammar school in Ipswich, and went into the office of his father, who was a solicitor, but his natural bent for art was so strong that he was apprenticed to a firm of wood engravers, for whom he drew illustrations for "Robinson Crusoe" and other works. After he left them he contributed drawings to the "Illustrated London News" and to "Once a Week," in which he illustrated Charles Reade's "The Cloister and the Hearth" and "He would be a Gentleman," and in 1850 he began to make initials and tail-pieces for "Punch." Except in a life class he had no instruction in art. After John Leech's death he became one of the principal "Punch" artists, and was the most popular of them all. His sketches, which were drawn with pen and ink, caught the characteristic foibles and types of the common people and the commercial class, and dealt with such ridiculous incidents as are of daily occurrence.

Kinglake, Alexander William, an English historian, born near Taunton, Somersetshire, in 1811; died in London, Jan. 2, 1891. Horsemanship and a love of Homer were inculcated by his mother in his childhood. After leaving Eton College he traveled in the East. He was called to the bar in 1837; but he gave little attention to the practice of law, being the heir of wealth and able to follow his literary and political ambitions. "Eothen," a volume of fresh and vivacious sketches of travel, the fruit of his first journey in the East, he withheld from publication for nine years. When it appeared, in 1844, in its revised and polished form, the author's reputation was at once established among cultivated readers. Kinglake entered Parliament in 1857 as a Liberal representing Bridgewater, a borough in his own county. He had hardly sat in the house a year when he moved an amendment to the conspiracy act in a speech marked by eloquence and forcible reasoning, which failed of their due effect by reason of the feebleness of his voice and his unimpressive manner. These defects prevented him from taking the high place that he hoped to achieve. He was the champion of the crew of the "Cagliari" who had fallen into the hands of the tyrannical Government of Naples, and of the crew of the "Charles and George" detained by the Portuguese in violation of international law, and in other cases came forward as an assailant of injustice and oppression. The acts of Napoleon III were often the subject of his denunciations, which were directed against the annexation of Nice and Savoy in 1860 with special vehemence. Kinglake was a friend of Lord Raglan, the commander-in-chief of the English forces in the Crimea, and as a student of military science he accompanied the invading army, was present at the battle of Alma, and watched the earlier development of the siege operations at Sebastopol. Already in 1845 he had obtained a practical acquaintance with warfare by riding with the flying columns of St. Arnaud in Algeria and witnessing the devastating campaign against the Kabyles and Arabs. Naturally Lady Raglan selected him to be the historian of her husband's deeds, confiding to his hands in 1856 all the letters and papers in her possession relating to the Russian war. His "History of the Crimean War," which is a memoir and panegyric of the British commander as well as a history of political and military events, completely occupied half his life. The first volumes appeared in 1863, and the last volume only a few years before his death.

Krüdener, Baron Nicholas Pavlovich, a Russian soldier, born in Livonia in 1812; died in Warsaw. He was descended from a noble family of the Baltic provinces, and was educated for the military profession in the Nicholas Engineering School. In the Russo-Turkish campaign, at the head of the 9th Army Corps, he took the almost impregnable fortress of Nicopolis, on the Danube, on July 15, 1877. Previous to this he had directed the bombardment of Nicopolis, and executed the feint by which the Turks were induced to concentrate at this point while the Russians crossed the river, on June 26, at Sistova. His laurels were dimmed for a time by the panicky retreat of the Russians from Osman Pasha at Plevna, which resulted in their being besieged for four months. Beyond the Balkans he gained fresh renown, and led the force that occupied Philippopolis.

Kuenen, Abraham, a Dutch Biblical scholar, born in Haarlem, Sept. 16, 1828; died in Leyden, Dec. 10, 1891. He passed through the Gymnasium at Haarlem, studied theology at the University of Leyden from 1846 till 1851, and having made a reputation as a Hebrew scholar was appointed extraordinary professor in 1853 and Professor of Theology in 1855. His "Liber Genesios" (1851) and his "Liber Exodus et Leviticus" were based on the study of a Samaritan version of the Pentateuch. A minute and indefatigable examination and comparison of the texts led him to conclusions different from those of Ewald and the Tübingen school. His great work entitled in English "A Historico-Critical Investigation of the

Origin and Collection of the Books of the Old Testament" (1861-'65) marked a new departure in the method and results of Biblical investigation; and it was greeted as an important contribution to theological science even by those who rejected his conclusions. Dr. Colenso, whose opinions as to the age of the Pentateuch were confirmed, translated the first part into English. The whole work was translated into German and French, and liberal theologians everywhere accepted it as a panoply for the fight. Of scarcely less influence were his subsequent works on "The Worship of Israel till the Overthrow of the Jewish State" and "The Prophets and Prophecies of Israel," both of which have been rendered into English. All three works tend to bring out in relief the connection between Judaism and the surrounding nations and the historical continuity of the national life. Dr. Kuenen presided over the sixth International Oriental Congress in 1883, and he received all the honors that the university could bestow on him.

Labastida y Davalos, Pelagio Antonio de, Archbishop of Mexico, born in Morelia in October, 1815; died in the city of Mexico, Feb. 5, 1891. He studied for the priesthood in the seminary of his native place, received holy orders in 1839, and was consecrated Bishop of Michoacan in 1855. He was a strong Conservative in politics, and when the Liberals triumphed in 1857 he went to Rome, where he was consecrated Archbishop of Mexico by the Pope. In 1859, when the Conservatives obtained the ascendancy, he returned, and was active in the movement for calling Maximilian to Mexico as Emperor. He officiated at the coronation, and exercised a strong influence on the political events of the empire. Juarez exiled him in 1867, and he lived in Rome and elsewhere until he was allowed to return in 1871. Afterward he again acquired much political influence, becoming a friend and adviser of President Diaz.

Laveleye, Emile Louis de, a Belgian political economist, born in Bruges, April 5, 1822; died in Doyon, near Liège, Jan. 3, 1891. He studied in the Athénæum at Bruges and in the Collège Stanislas at Paris, and went through the course of law at the University of Ghent. He devoted himself to politics and the study of economy and government. In 1864 he became Professor of Political Economy at the Liège University. He did not enter the Chamber, though he was an active and influential supporter of the Liberal party, defending its policy in Belgian and French journals. He was a regular contributor to the "Revue des deux Mondes," and a voluminous author on many subjects, publishing, among other works, "Mémoire sur la Langue et la Littérature Provençales" (1844); "Histoire des Rois Francs" (1847); "L'Enseignement Obligatoire" (1859); "La Question d'Or" (1860); "Questions Contemporaines" (1863); "Etudes et Essais" (1869).

Lebel, Nicolas, a French inventor, born in Angers, Aug. 18, 1838; died in Vitré, June 6, 1881. He entered the military academy of St. Cyr in 1855; was commissioned sub-lieutenant in 1857, lieutenant in 1863, and captain in 1869; fought in the war of 1870, and was taken a prisoner to Germany after Sedan. Appointed chief of battalion in 1876, he was shortly afterward placed in charge of the rifle school near Tours. Promoted lieutenant-colonel in 1883, his experience with fire-arms caused him to be placed on the commission appointed by Gen. Thibaudin, Minister of War, to discover a new form of rifle for the French infantry. The commission reported in favor of replacing the Gras rifle with a weapon of small caliber, but found no magazine apparatus that it could recommend. While directing the Normal School of Rifle Practice at Châlons he was nominated on a new commission, of which Gen. Tramond was chief, and Col. Gras and Col. Bonnet were members. This one recommended a repeating rifle called the Tramond-Lebel, model of 1886, chiefly after his design, with which the army is now supplied, the manufacture having been begun in December of that year. He was promoted colonel on Jan. 13, 1887, and in 1890,

owing to a chronic affection of the heart, he asked to be retired, and was appointed receiver of taxes at Vitré. Before he left the army he was made a commander of the Legion of Honor.

Lefroy, Edward Cracroft, an English clergyman, born in Westminster, March 29, 1855; died in Blackheath, Sept. 19, 1891. He was a grandnephew of Jane Austen, and his great-grandfather and grandfather were successively rectors of Ashe, near Basingstoke. His early education was received at Blackheath Proprietary School, and he was graduated at Keble College, Oxford, in 1877, taking orders the next year. His first curacy was at St. Mary's, Lambeth, where his sermons attracted the notice of the Archbishop of Canterbury. Later he held curacies at St. John's, Woolwich, and St. German's, Blackheath. His health failing, he gave up church work and devoted himself to teaching. He wrote many reviews for the "Globe" and the "Guardian," and in 1883 published a volume of sermons entitled "The Christian's Ideal." His other works are a volume of sonnets entitled "Echoes from Theocritus" (1885) and "Counsels for the Common Life" (1885).

Lévy, Calmann, a French publisher, born about 1820; died in Paris, June 18, 1891. He became in 1844 the partner of his brother Michel, who began business as a bookseller in 1836. Devoting themselves especially to the publication of dramatic literature, they extended their business, when their store in the Boulevard des Italiens became a lounging place for Parisian journalists and authors, and became the publishers of several periodicals, including the "Univers Illustré," "Extracite," and "Bons Romans." The death of Michel Lévy, in 1875, left Calmann sole proprietor of the immense business. It was said that his publications, including plays, numbered 2,000,000 volumes. His imprint was a guarantee not only of fair literary quality, but of decorum, and with the naturalistic school he would have no dealings. He was prominent in the Hebrew religious community, and was made a knight of the Legion of Honor in 1878. He left a great fortune.

Litolff, Henri, a French composer, born in London in 1818; died in Colombe, near Paris, Aug. 6, 1891. He was the son of a French father and an English mother, and was a favorite pupil of Moscheles, but went to France and married at the age of eighteen; became known as a pianist in Paris in 1839; gained fame in Belgium and Germany; and composed the overture to "Catherine Howard," and other works that found appreciation. In the midst of a brilliant success in London in 1846, he was prosecuted by the family of his deceased wife and fined heavily. Not being able to pay, he was kept in prison till he made his escape in 1850, and married the widow of a musical publisher in Hamburg, where he began to issue the famous collection of music that bears his name. He deserted his wife, who afterward got a divorce, gave concerts in various places, and married, in 1860, a daughter of Count Wilfrid de la Rochefoucauld. During his erratic career he composed an oratorio, half a dozen operas, and numerous smaller pieces. He was a brilliant pianist, and a composer of original genius and scientific knowledge.

Long, Edwin, an English artist, born in 1839; died in London, May 15, 1891. He handled subjects of Oriental antiquity and of classical and early Christian times, and his works, if deficient in artistic quality and technique, were dramatically impressive and pleasing. One of his earliest successes was the "Babylonian Marriage Market," painted in 1875, which was followed in 1877 by the equally popular "Egyptian Feast." Some of his late works are "Diana or Christ," painted in 1881; "Anno Domini," exhibited in 1883; and "Pharaoh's Daughter," shown in 1886. He became an academician in 1881.

Macedo Costa, Monsignor da, a Brazilian prelate, born in Margongipe, July 5, 1836; died in the middle of April, 1891. He completed his studies with honor in the Seminary of St. Sulpice in Paris, and was consecrated Bishop of Balem and Pará at the

age of twenty-five. In 1870, when Rio Branco was Prime Minister, he began the violent opposition to the religious policy of the Government, one of the incidents of which was the condemnation of the Bishop of Olinda to perpetual imprisonment. He subsequently became Metropolitan Archbishop of Bahia and Primate of Brazil. Among his published writings was a memoir on "The Religious Question."

Magee, William Connor, an English prelate, born in Cork, Ireland, in 1821; died in London, May 5, 1891. His father was an Irish clergyman, and his grandfather was William Magee, Archbishop of Dublin. He took his degree at Trinity College, Dublin, and for a time held a curacy in Dublin, which failing health obliged him to resign. In 1848 he became curate of St. Saviour's, Bath, and in 1850 sole incumbent. While in Bath he delivered a lecture on "The Voluntary System and the Church of England," which made a great impression. In 1856 he went to London to succeed Dean Goulburn at Quebec Chapel, and in 1860 became rector of Enniskillen. In 1864 he was made Dean of Cork; in 1866 dean of the Chapel Royal at Dublin; and in 1868 was consecrated Bishop of Peterborough. In January, 1891, he was translated to the archiepiscopal see of York. He was buried at Peterborough. As a controversialist he had few rivals, and as an orator was equally eminent. In the House of Lords Bishop Magee opposed the disestablishment of the Irish Church in a speech that was considered a masterpiece of eloquence, and a speech made by him upon the Intoxicating Liquors bill of 1872, was scarcely less powerful. He was a frequent contributor to the "Fortnightly Review" and other periodicals, and an article by him on the morality of betting attracted much attention a year or two ago. His attitude concerning the practice, although perfectly sincere, was generally considered somewhat injudicious. He was noted for the sharpness of his wit.

Magliani, Agostino, an Italian statesman, born in Lanzino in 1824; died in Rome, Feb. 21, 1891. He studied in Naples, and lived there till 1860. He held important posts in the administration for many years before he was called into the Cabinet of Depretis in December, 1877, as Minister of Finance. The ministry went out in a few months, but he returned to the same office in December, 1878, and held it twice afterward. Important financial reforms, such as the abolition of the grist tax, the resumption of specie payments, and the reduction of the price of salt, were carried out under his direction. He was nominated to the Senate after his retirement.

Mahon, James Patrick O'Gorman, an Irish politician, born in County Clare in 1802; died in London, June 16, 1891. He was the son of Patrick Mahon and Barbara, only daughter of The O'Gorman, and was commonly called The O'Gorman Mahon, a style still extant in only a half-dozen families descended from the old Irish chiefs. His father fought in the revolution of 1798, and he, after receiving his education in the University of Dublin, plunged into politics, and in 1824 was one of the founders of the Catholic Association. A model of masculine vigor, bold, active, self-confident, fluent of speech, a ready writer, and a master of the sword and pistol, he was one of O'Connell's most efficient lieutenants in the County Clare election in 1828, and in the contest for Catholic emancipation. In 1830 he succeeded O'Connell as member of Parliament for County Clare. Having quarreled with O'Connell, he could not be elected again for a Repeal constituency, and did not return to Parliament till 1847, when the famine brought about the disruption of the Repeal party. He sat for Ennis till 1852. For the next twenty-five years he led an adventurous life in many lands. He was involved in journalistic, financial, and political schemes in Paris and other Continental cities; then went to South America and became general of the Peruvian army, and afterward admiral in the Chilean fleet. After his return to Ireland he was nominated by Parnell as a candidate for County Clare, and elected

in 1879. He sat for that constituency till 1885, and in 1887 was returned for County Carlow. When the split occurred in the Irish party he declared against Parnell. Although a zealous partisan, he was on friendly terms with all the leading politicians, and till the last he retained his agile military bearing and vivacity of manner.

Maraix, Léon H., a French actor, born in 1850; died in Paris, Sept. 18, 1891. He was for a long time one of the leading actors at the Gymnase Théâtre, where he created the principal rôle in "Les Danccheffs." He became insane, and was committed to an asylum shortly before his death.

Marcke, Émile van, a French painter, born in Sèvres in 1827; died in Hyères in 1891. He was a pupil of Troyon, and first exhibited in 1857. Certain characteristics caught from his master he remained true to, adding nothing, but he was a conscientious painter, and his technique was good. He painted grazing cattle, grouped with taste and without mannerism, with some monotony of coloring and a softness of execution. He had a constant success, was liked by his fellow-artists, received many medals, was regularly elected on the Salon jury, and in 1872 was made a chevalier of the Legion of Honor.

Martinez, Alonso, a Spanish statesman, born in Burgos in 1827; died in Madrid, Jan. 14, 1891. He was a lawyer by profession, and practiced with much success during the intervals in his political career. In 1855 he was Minister of Public Works in the Cabinet of Gen. Espartero, and on the defeat of the Government was made Civil Governor of Madrid. He was a leader of the Centralist or Moderate Liberal party, a staunch supporter of the monarchy after the restoration in 1875, and retained the respect of his political adversaries by his political honesty and upright life. He held the portfolios of Justice and Finance several times, was last in the Cabinet in 1888, and afterward was President of the Congress until the dissolution of the Cortes.

Mase, Hippolyte, a French historian and statesman, born in Arras, Nov. 5, 1839; died in Paris, Nov. 5, 1891. He was a lecturer on history at the Lyceum of Douai, whence he was called to the professorship of History in the Lyceum of Versailles. The Government of Natural Defense made him Prefect of Landes. When the war was ended he returned to his chair, and in 1875 went to the Condorcet Lyceum. In 1879 he was elected a Deputy for Versailles, and, taking his seat with the Republican Left, he made a name for himself by his speeches on the subjects of education and mutual-benefit associations. He was re-elected in 1881, but failed to obtain one of the seats for Seine-et-Oise in 1885. The department elected him a Senator, however, in 1886, and in 1891 re-elected him at the head of the list. In the Senate, as in the Chamber, he addressed himself to the subject of co-operative provident associations. In 1887 he established a review devoted to the interests of these institutions. Among his numerous published works may be mentioned "Les Gouvernements de France" (1864); "La République des États-Unis" (1869); "La Fin de la Révolution par la République" (1872); "La Lutte contre la Misère" (1883); and "Les Généraux de la République: Kleber, Hoche, Mareau" (1887).

Miklosich, Franz von, an Austrian philologist, born about 1815; died in Vienna, March 7, 1891. He was the greatest Slavic scholar of his time, who discovered the principles of a comparative grammar of the Slav languages. Yet he was opposed to the Nationalist movement in Austria, and was a member of the German Liberal party. He was Professor of Slavic Languages and Literature in the University of Vienna. When the parliamentary era began in Austria he was appointed counselor to the Ministry of Education and president of the commission for state examinations, and in these posts he exerted much influence on the development of the Vienna University. He was an active member of the Austrian House of Peers.

Millet, Aimé, a French sculptor, born in Paris in 1816; died there, Jan. 14, 1891. He was a pupil of his father, the painter; studied sculpture under David d'Angers, and after 1845 he gave up painting and confined himself to sculpture. His "Ariadne," with which he gained the first medal in 1857, is in the Luxembourg gallery. He executed the colossal statue of "Vercingetorix" on the supposed site of Alesia in Burgundy, and the "Apollo" on the summit of the Opera building; also the Murger memorial in Montmartre, and the recumbent statue of Boudin. He was entirely devoted to art, had few social connections, took no amusement, and sought no honors.

Morelli, Giovanni, an Italian art critic, born in Verona in February, 1816; died in Milan, March 1, 1891. His father, a merchant, died when he was a child, and his mother settled in Bergamo, and sent him to the gymnasium at Aargau, whence he went to the University of Munich, and after a wild student's life was graduated in medicine. He formed associations with scholars and artists in Germany and Switzerland, and visited Paris before he returned to his native land with the intention of teaching comparative anatomy in some university. He soon became more interested in the political movement. Wandering through Italy on horseback, and sojourning now in Florence, now in Rome, whence he sent letters on political subjects to the Augsburg "Allgemeine Zeitung," and occasionally visiting his mother in Bergamo, when the revolution of 1848 broke out in Milan he headed the Bergamo volunteers, and, descending on Monza, seized the Austrian barracks. The Provisional Government of Lombardy sent him as its diplomatic representative to Frankfurt. The next ten years he passed mostly in Bergamo engrossed in the study of the Renaissance period and its art. In his visits to the galleries of Italy his observant eye caught the idiosyncrasies shown by different masters in little details; and he learned to recognize each painter's work by the defective drawing or peculiar treatment of the ear, the hand, the knee, or other part of the anatomy. Training himself in this method of observation he possessed a criterion by which he could correct the great authorities who filled books with their disputes regarding the authorship of paintings by kindred painters who attributed famous works to the wrong masters, and who pronounced good old copies to be originals. He did not, however, enter the ranks of professional critics, being recalled to political life after the war of liberation, in which he took no direct part. Elected to represent Bergamo in the Italian Parliament, he took his seat on the right among the adherents of Count Cavour. He fought in the war of 1866 at the head of a band of Alpine volunteers from Bergamo. In 1873 he was nominated a Senator. He had a part in the work of introducing the new Government in the Romagna. Morelli's discoveries were accepted and promulgated by many writers on art; his advice was sought by the directors of picture galleries in England and Germany, and his authority was quoted in the catalogues of the London, Madrid, Dresden, and Munich galleries, but in no Italian catalogue. His critical works were all written in German and published in Germany. In 1874 he began to publish his conclusions in the "Zeitschrift für bildende Kunst" over the pen-name "Ivan Lermolieff" (an anagram of his own name), treating first the pictures in the Borghese gallery at Rome. In 1880 he published a book on the Italian paintings in the Munich, Dresden, and Berlin galleries. In a curious preface to the Italian edition, which was made by a German, he said it had been translated without his permission, as Italians would not find his views to their taste. His own name was first printed in the English translation, published in 1883. When he changed his opinion regarding any painting he frankly corrected his former statements in the successive editions of his works. His latest judgments are contained in two illustrated volumes issued by Brockhaus of Leipzig—one, on the Roman galleries, in 1890, and the other, in 1891, dealing with the

German galleries. The last fifteen years of his life were passed in Milan, where he made a choice collection of Italian and Dutch masters, which he bequeathed to the town of Bergamo. By his application of the experimental method of criticism he cleared away many confused and fanciful traditions of art and assisted to solve the mysteries connected with Giorgione, Bellini, and other names, and to reduce to a scientific basis the history of the Venetian, Veronese, and other schools of northern Italy.

Moseley, Henry N., an English naturalist, born in Wandsworth in 1844; died in Clevedon, Somersetshire, Nov. 10, 1891. He was a son of the canon of Bristol; was educated at Harrow and Exeter College, Oxford, and studied medicine in University College, London, Vienna, and Leipsic. He was a member of the expedition sent by the British Government to observe the solar eclipse in Ceylon and India in 1871, and one of the naturalists on the "Challenger" expedition of 1872-'76; and was specially employed in collecting plants at all the points visited. After his return he resided in Oxford as a fellow of Exeter, and was engaged in preparing his book entitled "Notes of a Naturalist on the 'Challenger'" (London, 1879), and in editing his notes for the official report of the expedition. In 1881 he became Professor of Human and Comparative Anatomy in the University of Oxford. Prof. Moseley published many memoirs on subjects connected with natural history and biology, and was the author of a book on "Oregon: its Climate, Resources, People, and Productions" (London, 1878).

Mutkuroff, Sava, a Bulgarian soldier and statesman, born in 1853; died in Naples, March 15, 1891. He received a military education in Russia, and on the outbreak of the Bulgarian war for independence was assigned to the command of a legion of volunteers raised in Bessarabia, with which he crossed the Balkans with Gurko and took a distinguished part in the desperate fighting in the Shipka pass. After the peace he left the Russian service to enter the East Roumelian militia. With Filoff and Nicolaieff he carried through the regulations by which Aleko Pasha, in agreement with the Porte, freed the service from the incubus of Russian control, and opened the way to Bulgarian officers to reach the higher posts. This was the first Bulgarian victory over the Czar's emissaries. In the attempted revolution at Philippopolis he took a prominent part. In the Servian war he commanded a division of 16,000 men. As commandant of the garrison in Philippopolis he arranged the march on Sophia in 1886 for the restoration of Prince Alexander Battenberg, and when Alexander finally abdicated he was selected by Stambuloff to be one of his fellow-regents. After the election of Prince Ferdinand he was appointed Minister of War. He married Stambuloff's sister, and was devoted to his interests. When he was obliged by failing health to leave his post in 1890, Stambuloff kept it open for him until he was compelled by Prince Ferdinand to choose another War Minister. Mutkuroff was consoled by the appointment of inspector-general with the rank of major-general, but died a fortnight after his promotion.

Nakamura Masanao, a Japanese scholar, born in 1830; died in Tokio early in July, 1891. He became one of the most eminent Chinese scholars in Japan at a time when no other foreign culture or literature was known. Afterward he studied Dutch and English, acquiring a good literary knowledge of both, and when the revolution of 1868 removed the prohibition which previously prevented any Japanese from traveling abroad, he went to England to improve his acquaintance with Occidental civilization. On his return he opened a school like that of his rival, Fukuzawa. Young men and old flocked from all parts of the empire to listen to his lectures on politics and civilization, and through them his ideas on important questions of the time penetrated the masses more readily than those of the men at the helm of government. Subsequently he became Principal of the Normal

College for Women, and later on Professor of Chinese in the newly founded University of Tokio. In 1886 the Emperor nominated him a member of the Senate, and in 1890, on the adoption of the new Constitution, he was made a life member of the House of Peers. He translated Smiles's "Self-Help," Mill's "Essay on Liberty," and other works, into Japanese, and prompted and edited hundreds of translations made by his pupils. He was of assistance to the translators of the Bible into Japanese. He was the highest authority not only on the Chinese language and literature, but on the history and theology of Buddhism.

Napoleon, Prince Napoleon Joseph Charles Paul Jerome Bonaparte, usually known as **Prince Jerome**, born in Trieste, Sept. 9, 1822; died in Rome, March 17, 1891. He was the son of Jerome, ex-King of Westphalia by his second marriage with the Princess Frederika of

Württemberg, and was brought up under the care of his grandmother, Madame Letitia, mother of the first Napoleon. When he was nine years old the family was expelled from Rome on account of the participation of his cousins, the sons of Louis Bonaparte, in the insurrection in the Romagna, and he was taken to Florence, subsequently to Vienna, and in 1835 to Geneva. In 1837 he entered the military institute of Ludwigsburg in Württemberg. Allowed, in 1845, to live in Paris under the name of the Comte de Montfort, he was afterward expelled on account of his supposed participation in the Republican movement. After the revolution of February, 1848, he was elected a member for Corsica in the Constituent Assembly. He voted with the Moderate Republicans, and accommodated his views to those of his cousin Louis Napoleon, and was sent by the Prince President in 1849 as minister to the court of Madrid. Aspiring to the supreme power himself, he left his post without authority, and assumed the lead of the Mountain or Extreme Left. Possessing brilliant mental gifts, and a face and form that were a counterpart of the first Napoleon, he strove to embody the democratic side of the Napoleonic legend, the earlier career of the great Bonaparte, to resurrect the "Child of the Revolution," the militant champion who defended the republic against Europe in arms. His penetration and political genius were recognized, yet he could attach no party to his cause because his truth and honesty were always suspected. Although he stood aloof and induced his father to stand aloof from the *coup d'état*, and was never quite trusted or forgiven by Louis Napoleon, when the empire was fully established, in 1852, the Emperor felt the expediency of collecting the imperial family about him, excluding the descendants of Lucien, as they had been cut off from the succession by the decree of Napoleon I. Prince Jerome was a member of the council to regulate the family succession, and was made a Senator, a knight

grand cross of the Legion of Honor, and a general of division. He went to the Crimea, and was present at the battle of the Alma. His division contributed nothing to the victory, and the foes of Bonapartism marked him as an object of satire, stigmatizing him with no good reason as a coward. He afforded a colorable justification for the attack later by resigning his command and leaving the seat of war, where Marshal St. Arnaud was to die, on a plea of ill health, and gave further offense by publishing in Brussels a pamphlet criticising the policy and strategy of the war. From that time the opprobrious epithet of *Plou-Plou*, a corruption of *plomb-plomb*, indicating the man who ran away from bullets, was popularly applied to him. He fled from ridicule, and remained for some time out of France, returning to serve as an intermediary between the Emperor and the revolutionary and anti-Clerical elements. Like his sister, the Princess Mathilde, the widow of Paul Demidoff, he always cultivated the society of authors and free-thinkers. In June, 1858, he was appointed to the new ministry for Algiers and the colonies, but soon resigned. In January, 1859, he married the Princess Clotilde, daughter of Victor Emmanuel, who was then only King of Sardinia. Owing to incompatibility, added to political motives, they separated after eighteen years of married life. When the Emperor adopted an anti-Austrian policy, and declared war for the liberation of Italy, Prince Napoleon sought to become the leader of a Liberal policy for France, delivering speeches in the Senate on the temporal power of the Pope, and in Corsica on political liberty that created a great sensation. Soon the Emperor changed his mind again and disavowed his cousin's opinions, whereupon Jerome resigned his seat in the Council of State and his appointment as president of the commission for the Exposition of 1867. He had previously presided over that of 1855. He had strengthened the popular estimate of his lack of personal courage by declining, in 1861, to fight a duel with the Duc d'Aunale after attacking the Orleans princes in the Senate. Louis Napoleon called on him again for aid when relations with Germany became strained, sending him to seek allies in South Germany, Austria, and the Balkan countries and Turkey. After his return he had a part in securing the partial adoption, in 1869, of the system of parliamentary government and ministerial responsibility, by exerting himself to carry the reform further and make a clean sweep of the detested official clique identified with despotic methods. This brought him into direct collision with Rouher, the "Vice-Emperor." After the Liberal Ollivier ministry had failed to avert the German war his influence was gone. During the war he was in Italy, whither the Emperor had sent him, according to his own statement, for the purpose of persuading Victor Emmanuel to take sides with France. His absence from the field of battle was enough to prevent him from receiving the support from the army that was necessary for the realization of the hope of his friends that he would succeed the deposed Emperor. Prince Bismarck hotly denied that he ever thought of supporting Prince Jerome for the succession, or even the regency. In the early days he was very unpopular, and yet was dreaded by M. Thiers, who had him arrested and expelled after he had sought to gain a political footing in Corsica and was caught in a Bonapartist gathering at Millemont. Allowed to return by MacMahon, his first public act was to propose an alliance of Bonapartists and Republicans against the Bourbons. He had an open quarrel with the Prince Imperial and the chiefs of the Bonapartist party, and was defeated at Ajaccio by M. Rouher, but was given the seat on account of the latter's political disqualifications. In the Chamber he attacked the Clericals, by which he enraged the Right without conciliating the Left. He was one of the 303 who opposed Broglie and MacMahon in the crisis of 1877. In the next election at Ajaccio he was beaten by Baron Haussmann. His rupture with the Bonapartists was intensified by his sharp attacks on the past

policy and present attitude of the ministers of the empire. When the Prince Imperial was killed in South Africa, Prince Jerome, by the family law and the decision of the *Senatus-Consultum* of 1852, became the heir to the imperial throne, and was accepted as such by the majority of the party, but was rejected by Paul de Cassagnac and the most aggressive section of the Bonapartists, on the ground of his untrustworthiness and because the Prince Imperial had designated Prince Victor as his successor. The party was thus split into two bitter factions, one adhering to the father and the other to the son. In 1880 he issued a declaration approving the policy of the republic in proscribing the religious orders as a vindication of the principles of the Concordat, and denouncing the Conservative Union as supporting a policy opposed to civilization, science, and liberty. In 1883 he inconsistently appealed for the support of the Clericals in a manifesto calling for a *plébiscite* in condemnation of the atheistic republic which had refused its protection to religion, and of the domestic, financial, and foreign policy of the Government. For this he was arrested, but the charge was not pressed. The complete rupture between him and his son Victor was not brought about till 1884, after which the active Bonapartists gravitated into the son's party, which had the Clerical support without which Bonapartism was impotent; others went over to the Orleanists; and a great number of the rank and file accepted the republic. The law of 1886, banishing the descendants of families that have formerly reigned in France, sent both father and son into exile. The Boulangist episode dissipated all the remaining forces of Bonapartism excepting the faithful band still clinging to the hopes of Prince Victor. Prince Jerome Napoleon published many books and pamphlets giving theoretical expositions of the Napoleonic idea and system. He continued under the empire the publication of the correspondence of Napoleon I that was begun under Louis Philippe, and in this he characteristically suppressed everything that derogated from the fame and grandeur of his uncle. His "*Napoléon et ses Détracteurs*" is a reply to the indictments brought against Bonaparte by M. Lanfrey, Col. Yung, and M. Taine, in which much light is cast on his own character and political principles. In his last will Prince Jerome disinherited his son Victor, and forbade him to be present at the funeral, denouncing him as a traitor and rebel against parental authority. He appointed his son Louis his heir and political successor, to represent his opinions, political and religious, which were the true tradition of Napoleon I, and to fulfill the Napoleonic destiny, which is to be the organization of the French democracy.

Neruda, Johann, a Bohemian novelist and poet, born in 1835; died Aug. 24, 1891. Educated, before the revival of Czech literature, in German schools, he became the chief literary representative of the Nationalist movement. His writings, most of which were first printed in the "*Narodni Lisy*," had a strong political tendency and did much to inculcate anti-German feeling.

Nicolai, Baron, known as Père Dom Jean Louis Nicolai, a Russian soldier and religious devotee, died at the monastery of the Grande Chartreuse, France, Feb. 8, 1891. He was a lieutenant-general in the Russian army and aide-de-camp to the Czar, and as Governor-General of the Caucasus he suppressed the revolt under Schamyl. Seriously wounded in the course of the campaign, he went to Paris for medical treatment, and there he made the acquaintance of Bishop Dupanloup, through whose arguments he was converted to Roman Catholicism. Becoming a monk, he retired to the Grand Chartreuse, and passed there the last twenty years of his life.

Nicholas Nicolaievich, Grand Duke of Russia, born at Tsarskoje Selo, Aug. 8, 1831; died in St. Petersburg, April 25, 1891. He was the second of the three brothers of the Czar Alexander II. In the Turkish war of 1877 he was commander-in-chief of the Army of the Danube, and entered Bucharest amid the

plaudits of the populace. At the end of the campaign and just before the peace he was compelled to resign on account of corrupt dealings with army contracts, in which his brother Constantine was also involved. At the time of his death he was aide-de-camp to the Czar (his nephew), a field-marshal, and inspector-general of engineers and cavalry. While commanding the manœuvres in Volhynia in October, 1890, he was suddenly taken insane, and he remained in that condition till he died. He married, in 1856, the Princess Alexandra of Oldenburg, and left two sons.

Paparrigopoulos, Constantine, a Greek historian, born in Constantinople in 1815; died in Athens, April 26, 1891. He left Turkey after his father and other relatives had been beheaded for political reasons, and was educated in the Lycée Richelieu at Odessa. When Greek independence was established he went to the new kingdom and entered the civil service, and in 1851 he became Professor of History in the University of Athens. A number of historical monographs have been collected in two volumes of "*Historical Essays*," the first published in 1858 and the other in 1890. His chief work was a "*History of the Greek People*," published in five volumes between 1860 and 1874, and in a revised edition in 1885-'87. In a volume written in French and published in Paris, entitled "*Histoire de la Civilisation Hellénique*," he shows the continuity of Greek history down to modern times.

Parnell, Charles Stewart, an Irish statesman, born in Avondale, County Wicklow, June 28, 1843; died in Brighton, England, Oct. 6, 1891. The Parnell family emigrated from England to Ireland in the seventeenth

century. One of its members was the Rev. Thomas Parnell, the poet, and friend of Swift and Pope. Another was Henry Parnell, who was raised to the peerage as Lord Congleton in 1841. The Avondale estate was bequeathed by a friend to Sir John Parnell in the last century, and from him descended through his younger son William to John Henry, father of Charles Stewart. In 1834 John Henry Parnell visited the United States, and in May of that year he married Delia Tudor Stewart, daughter of Admiral Charles Stewart, the "*Old Ironsides*" of the United States navy. He returned with his American bride to Avondale, where he led the life of a country squire. Charles Stewart was their fourth son. When six years old the boy was sent to Yeovil, and he was afterward prepared for college by clergymen of the Established Church in Derbyshire and Oxfordshire. He entered Magdalen College, Cambridge, but took no degree. From his mother he undoubtedly imbibed his early political views. Her

house in Dublin is believed to have been a hiding-place for suspects. The young man finished his education by traveling in the United States with his elder brother John. In 1871 he returned to Avondale, where he endeavored to infuse American enterprise into the management of his estate, sinking shafts in search of minerals, and establishing a saw mill and a brush factory. He joined the militia of his county, becoming an officer in the Wicklow Rifles. His mind was gradually rising to an appreciation of the political struggle in Ireland, and the victory of Mr. Blennerhassett, also a Protestant landlord, as the representative of home rule, gave the deciding touch to his ambition to enter on a political career. In February, 1874, he made known his desire to stand for Parliament, but his office of high sheriff of County Wicklow, which he then held, disqualified him. A few months later the membership for Dublin becoming vacant through resignation, Mr. Parnell secured the nomination. He broke down utterly in his first speech; his voice and manner, so thoroughly English, alienated the Irish voters, and he was overwhelmingly defeated. Next year John Mitchel returned from exile in America to contest Tipperary, and Mr. Parnell wrote a strong and patriotic letter in support of his claims. Within a few weeks Mitchel and his brother-in-law John Martin, who represented County Meath, died, leaving two vacancies. Isaac Butt, leader of the Irish party in Parliament, invited Mr. Parnell to contest the seat for Meath, and he was elected April 19, 1875. He confined himself during his first year in Parliament to close observation of the methods of the House and the tactics of the Irish party. This had existed ever since the days of O'Connell, but lacked unity of purpose or action, many of its members being willing to barter their votes for Government favor. Mr. Butt was very conservative in his policy, and looked with horror upon the methods pursued by Joseph Biggar, who delighted to irritate his English opponents by speaking against time, moving adjournments, and other dilatory tactics. Mr. Parnell was the first to perceive the enormous power that a minority could wield without transgressing any of the rules of the House, and became a close follower and confidant of Mr. Biggar. Together they inaugurated, in 1876, a policy of obstruction that drew the attention of the world to the Irish question. To extirpate landlordism was the far-off dream of the early Irish patriots. The Land act of 1870 had failed to recognize the Ulster tenant right. The Irish party took up the fight, and Mr. Butt demanded fair rent, fixity of tenure, and free sale—a programme that came to be known as the "Three Fs." Home rule was regarded as a subsequent step. Mr. Parnell and Mr. Biggar determined to wrest laws from the English Parliament by prolonged conflicts. No subject was too irrelevant for them to debate at length. In February, 1877, Mr. Parnell introduced the Irish Church act amendment bill, the object of which was to enable the tenants of the disestablished Irish Church to become proprietors of the lands for which they were paying rent to a commission. The bill was defeated, and a policy of retaliation was immediately entered upon. The first test occurred on the "bill for the improvement of prison discipline," transferring Irish county prisons from the hands of the county officials to those of the Government. Messrs. Parnell and Biggar prolonged the contest until finally the Government gave up the bill in disgust, and the House adjourned without passing the measure. The mutiny bill was next brought forward, and Mr. Parnell vigorously attacked the clauses permitting flogging in the army, with the result that the bill was materially modified in the interests of humanity. The greatest battle of the session was fought over the South African bill, the object of which was to annex the Transvaal without so much as asking leave of the sturdy Boers who had opened up the new county. Mr. Parnell declared that, coming from a country which had experienced English cruelty to the fullest, he took special satisfaction

in endeavoring to thwart the intentions of the Government. For this language he was "named" and removed, but as he had clearly not transgressed any parliamentary rule the motion for suspension was abandoned, the Government announcing that new rules would be brought forward to deal with "obstruction." The introduction of these rules was fought by every parliamentary device. Mr. Butt expressed his indignation that certain members of the party should oppose matters in whose defeat Ireland was not directly concerned, but his influence quickly waned before the increasing popularity of Mr. Parnell. The latter was elected President of the Home Rule Confederation in 1878, in place of Mr. Butt, who, however, remained the nominal head of the party in Parliament until his death, May 5, 1879. Mr. Shaw was then chosen to lead the party. A contest between the moderate section and the Parnellites took place at Ennis, where a candidate nominated by Mr. Parnell was triumphantly elected over the nominee of Mr. Shaw. At this session of Parliament, through the efforts of Mr. Parnell, flogging in the army was finally abolished. Now the agrarian character of the Irish question began to develop. The harvest of 1877 was bad; that of 1878 was worse; in 1879 starvation faced the Irish people. Michael Davitt, who had been released from a convict prison on a ticket of leave, founded the Land League in County Mayo, April 28, 1879. Mr. Parnell joined it in the following June, and in a fervid speech gave the famous advice, "Keep a firm grip on your homesteads." He was elected President of the Land League Oct. 21, 1879. At the close of the session Mr. Parnell made a tour through Ireland, being received everywhere with the greatest enthusiasm, and then acquiring the sobriquet of "Uncrowned King of Ireland." Wishing to obtain pecuniary assistance for the agitation, and also to use American public opinion as a lever in influencing the minds of the English masses, Mr. Parnell and Mr. Dillon sailed for the United States in December, 1879, traveled through the country as far west as St. Louis, and returned by way of Detroit and Canada. The United States Congress gave him permission to address them in the hall of the House of Representatives, a privilege previously accorded to only three persons—Lafayette, Bishop England, and Kossuth. Parliament was suddenly adjourned, and Mr. Parnell returned immediately to conduct a vigorous campaign throughout Ireland. He was elected by three constituencies—Meath, Mayo, and Cork city—and chose the last. At the meeting of the newly elected members he was selected to succeed Mr. Shaw as leader of the party. The conservatives in England had fought the campaign largely on the Irish question and had been defeated by Mr. Gladstone, who immediately brought in a bill that granted to Irish tenants the right to compensation for improvements they had made on the land they occupied. The bill, which would have stopped evictions, failed in the House of Lords. Then the landlords adopted a policy of wholesale evictions, which aggravated matters. During the recess Mr. Parnell visited Ireland, and in a famous speech, when some one of his hearers suggested the shooting of persons who might take farms from which a former tenant had been evicted, said that he wished to point out a much more Christian way: "Shun him on the roadside, in the streets, in the shop, in the market-place; by leaving him alone, by isolating him from the rest of his country, as if he were the leper of old, you must show him your detestation of the crime he has committed." Three days later began the famous siege of Lough Mask, where Capt. Boycott, who had issued ejectment processes, was subjected to the treatment advised. Not a harvester would remain in his service, not a shop-keeper would sell him anything, not a landowner would wash for him. Finally 50 laborers, obtained from Ulster under an escort of 7,000 armed soldiers, succeeded in gathering his crops. Thus Mr. Parnell added a new and terrible weapon to the forces of obstruction and a new word to the language, "boycotting." (But the orig-

inating of this word is also claimed for James Redpath. See article "boycott" in the "Annual Cyclopædia" for 1890). Boycotting spread all over Ireland, and became the great instrument of the Land League. The Government was not quite sure whether the acts of the League were illegal, but in November, 1880, Mr. Parnell and others were indicted and tried in Dublin, the trial lasting from Dec. 28 to Jan. 16, 1881, and resulting in a disagreement of the jury. Meanwhile crime had largely increased throughout Ireland, and when Parliament met the Government brought forward three bills: one of coercion, allowing the detention of suspected persons without trial for any length of time; one of suppression, making it a felony to keep or distribute arms in proclaimed districts; and a third, of pacification, offering a land act that established a commission to arbitrate between landlord and tenant. The two coercive measures were opposed line by line and word by word by Mr. Parnell and about thirty of the Irish members. All-night sessions were frequent, and the discussion was only ended by the Speaker arbitrarily declaring the debate closed, Feb. 2. Michael Davitt was arrested the next day in Ireland, and on the Irish members protesting against the conduct of the Government, Mr. Dillon, Mr. Parnell, Mr. Finnigan, and twenty-eight others were one after another "named" by the Speaker, suspended, and forcibly removed from the House. Then the coercion acts were quickly passed, and the land bill came up. This land act, introduced by Mr. Gladstone, was the greatest blow to private ownership of land ever given by any legislative body. A commission was appointed, before whom the tenant could appear if he thought his rent too high and secure the fixing of rent by the court, irrespective of the wishes of the landlords. Naturally they regarded it as socialistic. But it passed the House in July, the Lords did not dare to reject it, and it received the royal assent in August. Mr. Parnell and his followers opposed its passage, on the ground that it did not go far enough, and the leader then declared that he would not be satisfied with anything less than that the land should belong to the cultivators thereof. The bill having become a law, it was decided to test its value, and Mr. Parnell advised that no appeals be taken to the land court without first having been submitted to the Land League executive. Mr. Gladstone construed this as a defiance of the law, declared that "the resources of civilization were not yet exhausted," and on Oct. 13 arrested Messrs. Parnell, Sexton, O'Kelly, William O'Brien, and Quinn, and lodged them in Kilmainham jail. Retaliation quickly followed, Oct. 18, in the shape of the "No Rent Manifesto," signed by the imprisoned leaders, counseling the tenants to pay no rent until they were released and constitutional government was restored. The Government replied, Oct. 20, by proclaiming the League an illegal organization, and the manifesto itself broke down, being condemned by the clergy everywhere. Naturally crime increased with the repressive measures of the Government, and thousands were arrested throughout Ireland on suspicion and without trial. The Liberal party soon began to see the folly of attempting to imprison a whole nation, and peace was determined upon. Capt. O'Shea was the intermediary between Gladstone and Parnell, and the famous Kilmainham treaty was concluded, in which the latter intimated that if the arrears of rents of the smaller tenantry were wiped out and the coercion act abandoned, he would "co-operate cordially for the future with the Liberal party in forwarding Liberal principles." Mr. Parnell and his associates were released May 2, 1882, and the abandonment of the coercion act was announced. Mr. Forster, Chief Secretary for Ireland, was succeeded by Lord Frederick Cavendish, and Thomas Burke became under secretary. Two days later both gentlemen were brutally murdered in Phoenix Park, Dublin. Mr. Parnell issued a proclamation expressing his horror of the crime, but the Government was forced into another and severer coercion act. Mr. Parnell

attempted to recover the ground lost by his party through the Phoenix Park murders, and assisted the Government in passing the arrears act in 1882 and the tramways and laborers acts in 1883. A sum of £35,000 was raised for him in Ireland and America in the spring of 1883, and the Land League, which had been suppressed, was revived under the name of the National League. He secured the extension of the franchise to every householder in Ireland, and in the session of 1885 forced the Government to assent to a land-purchase bill, which was postponed by the overthrow of Mr. Gladstone in June. In the succeeding elections Mr. Parnell nominated every candidate of the Irish party, and returned to Parliament with a compact body of 85 members ready to vote on every proposition in accordance with his wishes. Finding that he could obtain nothing from the Conservatives, Mr. Parnell threw in his vote on the side of Mr. Gladstone, and the Liberals came into power January, 1886. Mr. Gladstone proposed a home-rule measure that secured the support of all the Irish members, but split the Liberal party in twain and restored Lord Salisbury to power in July, 1886. Near the close of the session of 1887 the London "Times" published a series of articles entitled "Parnellism and Crime," attempting to connect Mr. Parnell with the Phoenix Park murders and other assassinations and outrages, and in support publishing letters purporting to have been written by Parnell. These were proved to be forgeries, and their author, one Piggott, fled to Madrid, where he committed suicide. Mr. Parnell brought suit for libel against the "Times" and recovered £5,000 damages, the suit being compromised on that basis. He was then at the height of his power, welcomed with cheers when he rose to speak in the House of Commons, presented with the freedom of Edinburgh in July, 1889, and invited by Mr. Gladstone to Hawarden to settle the details of the Liberal programme. But just then his downfall was preparing. Capt. O'Shea filed a petition for divorce from his wife, naming Mr. Parnell as corespondent, Dec. 28. It was proved that Parnell's relations with Mrs. O'Shea had been maintained with increasing intimacy ever since 1881, a circumstance which accounted for his frequent and mysterious absences from his seat in Parliament. Neither party put in any answer, but privately Mr. Parnell emphatically denied that he had "betrayed friendship, abused hospitality, or broken up a happy home." The divorce was granted in November, 1890. On the assembling of Parliament in the same month, Mr. Parnell was unanimously elected chairman of the Irish party. Mr. Gladstone and Michael Davitt demanded his retirement as the only chance of saving the home-rule cause. Mr. Parnell refused, and a bitter faction fight was the result. Both sides put up candidates for a parliamentary vacancy in North Kilkenny, and Parnell's candidate was defeated Dec. 22, 1890. The Irish bishops took sides against him, and every one hurled stones at the falling leader. But the woman for whom he had sacrificed his political future remained affectionately devoted to him, and on June 25, 1891, Mr. Parnell and Mrs. O'Shea were married at the registrar's office, in Steyning, Sussex. They resided at Brighton, Mr. Parnell going over to Ireland on several occasions to speak in the interests of his candidates, but meeting with uniform defeat. He grew broken-hearted and despondent, while constant attacks embittered his life and began to break down his constitution. He took cold at a public meeting in Ireland, Sept. 27, returned to Brighton, Oct. 2, and died four days later. His body was buried in Glasnevin cemetery, near Dublin, Oct. 12, 1891.

Pedro II de Alcantara, Joan Carlos Leopold Salvador Bibiano Francisco Xavier da Paul Leocadio Miguel Rafael Gonzaga, Prince of Braganza, ex-Emperor of Brazil, born in Rio Janeiro, Dec. 2, 1825, died in Paris, Dec. 5, 1891. He was the son of Dom Pedro I of Braganza and Bourbon, the first Emperor of Brazil, and of Leopoldina, Archduchess of Austria. The royal family of Portugal fled to the colony of Brazil in 1807

when a French army occupied Lisbon, and in 1815 the colony was declared a kingdom. On the death of the insane Queen Maria in 1816 the Regent, her son, was proclaimed King of Portugal, Algarvez, and Brazil, under the style of Joan VI. In 1822, on the summons of the Portuguese Cortes, the King and his court returned to Lisbon, and on May 13, 1822, Dom Pedro, his eldest son, was chosen Perpetual Defender of Brazil. On Sept. 7, 1822, he proclaimed the independence of the country, and was elected Constitutional Emperor. Falling heir to the Portuguese throne in 1826, he resigned it in favor of his infant daughter, Maria da Gloria, and on April 7, 1831, he abdicated the throne of Brazil in favor of his son, who was proclaimed Emperor as Dom Pedro II, declared of age on July 23, 1840, and crowned on July 18, 1841. On May 30, 1843, he was married by procuration, and on Sept. 4 in person, to Theresa, Princess of Bourbon and the Two Sicilies, who was born March 14, 1822, and died Dec. 28, 1889. They had two sons, who died in infancy; a daughter Isabel, born July 29, 1846, who married Oct. 15, 1864, Prince Louis of Bourbon-Orleans, Comte d'Eu, the eldest son of the Duc de Nemours, and has three sons living; and another daughter, Leopoldina, who was married to Prince August of Saxe-Coburg-Gotha, and died in 1871, leaving four sons. Dom Pedro was distinguished from his early years for a strong interest in science and the useful arts. He held liberal and progressive political doctrines, and gave much attention to developing the material resources of the empire and seeking profitable commercial relations with other countries. Without transgressing the bounds of a constitutional sovereign, he showed great tact in guiding the political forces, in leading in reform legislation, and in holding the balance of power between the parties and steering the country through political crises. The movement for the abolition of slavery was instituted to a great extent by him, and he took the lead in practically emancipating the slaves on the royal estates in 1866. Dom Pedro was always a great traveler. In the last years of his reign he resided for a great part of his time in Europe, where he underwent treatment for a chronic ailment. By this he lost touch with the politicians and people of Brazil. He was accustomed to say that he would abdicate willingly if the Brazilians wanted a republic, but that they did not because they already had all the advantages of republican government. While he was away his daughter and heir acted as Regent. She was not popular for the reason that foreign priests had much influence over her and she was supposed to be dominated by her husband, whose dictatorial ways had made him obnoxious to officers of the army and others. The sudden emancipation of the slaves had produced a social crisis, and the Regent in signing the decree had offended the former owners of the slaves. When the law providing for the gradual emancipation of slaves was passed, in 1871, Dom Pedro was congratulated by every civilized government. The system of public schools introduced under his auspices had earned the gratitude of the Brazilian people. When he visited Europe in 1871 he attended all the meetings of learned societies in France and England, and on his visit to the United States at the time of the Centennial Exhibition he made a thorough study of American industrial processes and inventions. His intervention in Paraguay, which led to the overthrow of Rosa, added a large strip of territory to Brazil and secured the free navigation of the Rio de la Plata. A dispute with Great Britain was settled in favor of Brazil by the arbitration of the King of the Belgians. His popularity in Brazil was undiminished till his last absence and his failing health led the Republicans, who were numerous and strong, though not active as a political party, to lay plans for preventing the coming of the daughter to the throne. On Nov. 15, 1889, a military conspiracy culminated in the forced abdication of Pedro and the proclamation of the republic. He was taken on board a Government vessel and conveyed, with the

rest of the royal family, to Lisbon. The liberal pension that was offered by the Provisional Government he refused to accept. In the new Constitution adopted on Nov. 15, 1890, it was provided that an annuity should be granted sufficient to guarantee him a decent subsistence. As many of his old adherents followed him into exile and were dependent on his bounty, he was reduced to pecuniary straits. He lived but a short time in Portugal, where his presence was not welcome, and wandered to Paris and other places, depressed and lonely from the loss of his wife, but not cast down by his political misfortunes. To the end he thought the Brazilians would yet recall him. (For a portrait of Dom Pedro, see "Annual Cyclopaedia" for 1877, page 74.)

Peruzzi, Ubaldo, an Italian statesman, born in Florence in 1821; died there, Sept. 9, 1891. He came of a Tuscan patrician family, and was educated in the Paris School of Mines and in Germany. He took part in 1848 in the movement for the recall of the grand duke, and for the next ten years as an adherent of the Moderate Liberal party labored to bring about a fusion with the Democrats. He had an important share in issuing the "Bibliotheca Civile," the aim of which was to prepare the way for Italian union under the house of Savoy. In 1859 he was elected to the Tuscan Chamber, and was dispatched by the Provisional Government on a delicate mission to France. After the annexation of Tuscany by Sardinia he was sent as a deputy from Florence to the National Parliament at Turin. In 1861 he was called into the Cabinet of Cavour as Minister of Public Works. He remained in this post under Ricasoli, and made strenuous efforts to carry out the development of Italian railways. When the Cabinet gave place to the Rattazzi ministry he became one of the leaders of the Opposition, and after the fall of this Cabinet he received the portfolio of the Interior, which he held till the crisis of 1864. He subsequently supported the system of evolution adopted by Depretis, and was a member of the Senate. He was eminent in the engineering profession.

Plumptre, Edward Hayes, an English clergyman, born in London, Aug. 6, 1821; died in Wells, Feb. 1, 1891. He was educated at University College, Oxford, and was elected Fellow of Brasenose College in 1844. He was made chaplain of King's College, London, in 1847, pastor of pastoral theology in 1853, and professor of New Testament exegeses in 1864. He was preacher at Lincoln's Inn for some years; elect preacher at Oxford in 1851-53 and 1864-66, and Boyle lecturer in 1866. In 1863 he became prebendary of St. Paul's, and in 1869 rector of Pluckley, in Kent, which living he exchanged for the vicarage of Bickley. From 1869 to 1874 he served on the committee of the revisers of the Bible, and in 1872-74 was Grinfield lecturer on the Septuagint at Oxford. In 1881 he was appointed to the deanery of Wells. He was widely known as a scholar in many branches of study. His published works are: "Sermons at King's College" (1859); "Lazarus, and other Poems" (1864); "Master and Scholar, with other Poems" (1866); "Christ and Christendom" (the Boyle Lectures, 1867); "The Tragedies of Sophocles in Verse" (1868); "The Tragedies of Aeschylus in Verse" (1868); "Things New and Old, Poems" (1884); "The Spirits in Prison" (1884); "The Commedia and Canzoniere of Dante" (1886). He edited the "Bible Educator" in 1877-79, and was the author of several sections of Bishop Ellicott's "New Testament Commentary."

Polak, Edward, an Austrian Orientalist, born in 1820; died in Vienna, Oct. 9, 1891. He was graduated in medicine at the University of Vienna, and in 1851 went to Persia to be Professor of Surgery in the military school at Teheran. In two years he was able to lecture, and write books in the Persian language. He was a favorite of the Shah, who made him court physician. He returned to Vienna in 1860 and published his great work on the geology, the flora, and other physical features of the Persian Empire, with its archaeology. He went out again to Persia for a

short time, and in his later life he spent a great part of his income providing young scientific explorers to visit Persia.

Pouyer-Quertier, A. T., a French statesman, born in 1820; died in Rouen, April 2, 1891. A firm believer in Bonapartism, he was elected deputy to the Corps Législatif from the Seine-Inférieure in 1857, having previously held various municipal and provincial offices. He was as strong a Protectionist as he was an Imperialist, and therefore after the conclusion of the treaties of commerce on a free-trade basis in 1862 he entered the lists against the Emperor's commercial policy, and was one of the most eloquent and most dangerous adversaries of the Government on economical questions. For this reason he lost his seat in 1869. On Feb. 8, 1871, he was elected to the National Assembly from his old district by an overwhelming majority, and on Feb. 25 was intrusted with the portfolio of Finance and with the duty of taking part in the decision as to the terms of peace. The Germans in Berlin treated him with special consideration, and through him they secured a rapid settlement of the terms of the treaty of peace. The tendency toward a protectionist policy in France was observed, as soon as he took charge of the Ministry of Finance, by Prince Bismarck, who willingly agreed to the clause of the Frankfort treaty proposed by Pouyer-Quertier by which each government accords to the other most-favored-nation treatment. By this stipulation Pouyer-Quertier falsely hoped that France would recover through the channels of trade the war-fine of 5,000,000,000 francs. When Germany recently endeavored to form a central European Zollverein, he boasted that by his foresight the arrangement had been rendered nugatory, while the Germans are equally satisfied in being able to claim under his clause the reduced schedules in the new French tariff. After his return to France in 1871 he had the good fortune to have the loan of 2,500,000,000 francs subscribed twice over in France alone, and to secure the adoption of all the proposed new duties, with the exception of certain raw materials. Confidence in him was disturbed, however, by his attempt to defend the irregular financial methods of M. de la Motte, prefect of the Eure Department, and on March 5, 1872, he gave in his resignation. Since then he has filled no ministerial post, but he has taken an active part in the discussion of financial questions, at first in the Chamber and afterward in the Senate. He lost his seat in the Senate to a Republican in the elections of February, 1891.

Praeger, Ferdinand, a German musician, born in Leipzig, Jan. 22, 1815; died in London, Sept. 2, 1891. He was a son of Heinrich Aloysius Praeger, a noted violinist and composer, and, though intended for a Protestant clergyman, he learned the violoncello and piano; went to Holland and taught music before he was sixteen, and in 1834 made his way to London, where he gave lessons for a living and composed sonatas and other pieces for the piano-forte and the orchestra. Of his published pieces, mostly written in his early life, forty-eight of the best are contained in the "Praeger Album." He engaged also in musical journalism, lectured, and published a translation of Emil Naumann's "History of Music," a work on composition, and "Wagner as I knew him."

Pressensé, Edmond Dehalet de, a French Protestant clergyman, born in 1824; died in Paris, April 8, 1891. In the time of the empire he made a great name for himself as a preacher. A strong Republican from the time of the revolution of 1848, he affirmed his political doctrines under all circumstances. He occupied himself also with social problems, and took a bold position in discussions in the various social science congresses held in Belgium and Switzerland between 1860 and 1870. On the re-establishment of the republic he became a member of the National Assembly, and was afterward a Senator. He wrote several works on theological subjects, among them "Études Évangéliques," "Vie de Jésus," a reply to Renan's book, and the "Histoire de l'Église et de la Révolution."

Quick, Robert Herbert, an English educator, born in 1831; died at Redhill about March 20, 1891. He was graduated at Trinity College, Cambridge; was for some years a master at Harrow School, and subsequently vicar of Sedbergh in Yorkshire. When a course for the instruction of teachers was introduced at Cambridge he was appointed a lecturer, and delivered a series of lectures on the "History of Education." He contributed papers on educational problems to pedagogic journals, and was the author of "Essays on Educational Reformers," a work highly esteemed by students of educational methods, which was first published in 1868 and was undergoing a revision at the time of his death.

Quinton, James Wallace, an Anglo-Indian administrator, born in Ireland about 1835; died in Manipur, March 25, 1891. He was graduated at Trinity College, Dublin, passed the examination for the Bengal civil service, and went out to India in November, 1856. He spent eight years as a district officer in the Northwest Provinces; was sent in 1865 as deputy commissioner to the newly annexed province of Oude, became officiating commissioner there, and in 1875-'77 was a judicial commissioner in British Burmah. Returning to the Northwest Provinces, he was a magistrate, collector, and judge of sessions in Allahabad, commissioner for different divisions in 1880-'85, and member of the Viceroy's Council for the Northwest Provinces. In 1889 he was selected, on account of his practical judgment and experience, to be chief commissioner of Assam. In this capacity he went to Manipur, where he attempted to carry out the decision of the Indian Government regarding the Senaputty, and was killed with his companions.

Rao, Sir Madhava, an Indian statesman, died in Madras, March 28, 1891. After the transfer of the Government of India from the Council of the East India Company to the British Crown the policy of annexing the territories of troublesome native rulers was to a great extent given up in favor of the plan of deposing the prince, placing a child on the throne, and during the minority of the new prince placing the state under British administration. It was found that the administration of British officers had the serious disadvantage of throwing the machinery of native government out of order; and therefore a demand arose for thoroughly loyal and subservient native statesmen, who could be intrusted with the government of native states that were to be thus disciplined. One of the ablest and most successful of this school of native administrators was Sir Madhava Rao. He was trained to official business in the British service; and when the Gaikwar of Baroda was deposed in 1875 on a charge of attempting to poison the British resident, and the child of a humble family remotely related to the dynasty was declared prince in his place, the Madhava Rao, who was a Hindu patriot and a leading member of the Brahmanical community of Madras as well as an Indian official of high rank, was made joint regent and practical ruler of the state with the title of Rajah. When, in 1883, he handed over the government to the young Gaikwar, who had been carefully educated by English tutors, the native system of administration had been preserved, and yet he had brought Baroda up to the condition of a model feudatory state. He retired to the seclusion of a hermit's life, following the practice of Brahmans who have been prominent in public affairs, at the same time discharging his duties as a member of the Madras Legislative Council, and speaking out plainly and with immense influence over the Hindu community on all the public questions of the time. He was convinced of the uselessness and evil results of any movement for the overthrow of British rule, but believed that the progress of education had brought about a necessity for the co-operation in the government of the intellectual and influential classes of natives; advising, however, the slow and gradual adoption of native participation, with due regard to the traditions and requirements of the less advanced sections, not the hasty in-

roduction of a Western system of representative government, such as the enthusiastic young recipients of European culture desired. Two volumes of the "Opinions of Sir Madhava Rao" were published by his friends shortly before his death. He supported the demands of the Indian National Congress from 1885 till 1889, but opposed the scheme accepted by the Congress in 1890. He was one of the early advocates for the reform of child marriage, enforced widowhood, and other disadvantages under which Hindu women suffer, but was convinced that the movement in this direction ought to be spontaneous within the Hindu community, and therefore he resisted with all his influence the age-of-consent bill of 1891, although he had for many years incurred the hostility of orthodox Hindus by advocating the same reform.

Redwitz, Oskar, Freiherr von, a German poet, born in Lichtenau, near Anspach, June 23, 1823; died in Gilgenberg, near Bayreuth, July 7, 1891. After leaving the gymnasium he studied law, but abandoned this study to give himself up to literature. His first published poem, "Amaranth," met with extraordinary success, and made him a famous man at twenty-five. None of his later works made such an impression as this lyrical epic. Yet his plays, "Philippine Welsch," which was produced in 1859, and "Der Zunftmeister von Nürnberg," brought out the year following, have kept the stage to this day. In 1871 he wrote a patriotic ode entitled "Das Lied vom neuen deutschen Reich." Removing from Munich to Obermais, near Meran, for the sake of his health, he composed the romances "Hans Wartenberg," "Hymen" and "Glück," the first and the last of which went through many editions. His ailments obliged him to give up literary employment for the rest of his life.

Reuss, Eduard, a German theologian, born in Strasburg in 1804; died there, May 12, 1891. He studied at the University of Strasburg, and in Halle and Paris under Gesenius and Silvestre de Sacy. From 1839 he occupied the chair of Theology in the University of Strasburg, and held a prominent place among champions of the liberal school of Protestant theologians. He published in French and in German important treatises on the Old and New Testaments. His last and greatest work was a translation of the Bible with commentaries, which is regarded as inestimable by many Hebraists.

Ribot, Augustin Théodule, a French painter, born in the Department of Eure in 1823; died in Colombes, Sept. 11, 1891. He was the son of a civil engineer, whose early death left the family in poor circumstances. He entered the *atelier* of Glaize in Paris in 1851; earned money with copies of Watteau's pictures; and in 1861 exhibited the "Cuisiniers," which made him famous at once. It was followed by other naturalistic pieces of *genre* work in a style that recalled the Dutch masters, and then he applied the same method to more elevated subjects, painting his "Saint Sébastien," "Jésus et les Docteurs," "Samaritain," and "Mère Morieu" and "Comptabilité," two half-figures. In the war his studio and all his pictures and property were burned. His later works were in the vein of his first productions, faithful impressions of the picturesque in nature, dealing often with ugly subjects. He was recognized as one of the masters in contemporary art, yet many objected to the gloomy tones of his coloring.

Rotelli, Luigi, an Italian prelate, born in Perugia in 1833; died in Paris, Sept. 16, 1891. His studious habits, bright intelligence, and fidelity to duty when a boy studying in the diocesan college attracted the attention of Gioacchino Pecci, the present Pope, who went to Perugia as bishop. He acquired a fine Latin style, and distinguished himself in theology and philosophy, and in a few years his patron placed him in charge of the seminary at Perugia, and afterward introduced him into the diplomatic service of the Vatican. He became Bishop of the See of Montefiascone, and afterward Archbishop of Pharsalus, and after Cardinal Pecci became Pope he was intrusted with various delicate missions, and in 1886 was sent

as apostolic delegate to Constantinople. On June 23, 1887, he was appointed Papal Nuncio to Paris. His task was to carry out the conciliatory policy toward the republic that the Pope had decided on when he saw that there was no hope of a monarchical restoration, and that the power of the Catholic body was weakened by the bickerings between the various factions of Imperialists and Royalists. This policy he urged on the Catholics of France, and after Cardinal Lavigerie had come out openly for the republic, the Pope gave his approval to the new movement in a letter which influenced a majority of the French bishops and some of the leading Clerical journalists and politicians to accept the republic. Having been instrumental in bringing about this state of affairs, Monsignore Rotelli was replaced in 1891 by Monsignore Ferrata, and was raised to the cardinalate.

Schmidt, Friedrich, a German architect, born in Frickenhofen, Sambia, about 1825; died in Vienna, Jan. 23, 1891. His father, a Protestant pastor, had migrated from Hanover, where the grandfather was court architect. The pastor had a passion for building, and his boy was determined to be an architect from his childhood. He went through the Gymnasium at Schorndorf and the Scientific High School at Cannstadt, and, having an overpowering fondness for Gothic forms, he went to Cologne and got employment on the cathedral work as a stone-carver's apprentice. The chief architect discovered his capabilities, and made him his assistant, and afterward overseer. After passing the architects' examination in Berlin, he built some private houses in Cologne and his first Gothic church in Quedlinburg. Like many other artists of romantic bent, he embraced the Roman Catholic religion. A high Austrian official who came to know him in Cologne procured for him the appointment of professor in the academy at Milan, where he began his work in 1857. He was greatly liked by the Italian students, whom he inspired with his own enthusiasm. While there he restored the Santo Ambrogio Chapel, and built a church in Brescia. In 1859 the Italians tried to induce him to stay, but he left with the rest of the Austrian officials, and settled in Vienna. His first work there, a brick gymnasium in the modern Gothic style, already developed in north Germany, offended the taste of the Viennese, and when he afterward placed a Byzantine dome on a Gothic church the critics found much fault with his hardness. He completed the spire of St. Stephen's, and worked eagerly at the restoration of that cathedral against much opposition. His plan for the Berlin Rathhaus received the first prize in 1859, though finally rejected on account of the distaste of the Berliners for the Gothic. In Austria and Hungary, where the Renaissance style was most at home, he created a liking for Gothic forms by his enthusiasm and the influence of his personal charms and persuasive tongue. He soon gained a great reputation as an architect and restorer. He designed the Herz Jesu Church for the city of Cologne. His later works are distinguished by a bold freedom and breadth of style that he had caught in Italy. The chief of his productions, the Vienna Rathhaus, is a combination, as much Renaissance as Gothic, marking the development of a modern style by a union of both.

Simor, Johann, a Hungarian prelate, born in Stuhlweissenburg, Aug. 23, 1813; died in Gran, Jan. 23, 1891. He was the son of a humble artisan. After passing through the gymnasium, he entered the preparatory school for the clergy at Presburg in 1828, and in 1836 was ordained a priest and appointed a chaplain in Theresienstadt. His talents as a preacher and his learning advanced him in less than three years to the position of University preacher and Professor of Religion in the theological faculty at Pesth. In 1842 he gave himself up to the cure of souls, seeking a pastorate at Bajna, near Gran. Four years later he was called to the professorship of Encyclopedic Theology in the Gran Presbyterium, and in 1847 he was appointed to the important post of

secretary of the Gran archbishopric. In 1851 he was called into the Ministry of Education as director of ecclesiastical affairs for Hungary. In 1857 he was consecrated Bishop of Raab. In 1867 he was appointed Archbishop of Gran and Primate of Hungary. His first important official act was to crown the Emperor Franz Josef King of Hungary. In 1873 he was made a cardinal. He disposed of large revenues, spending an annual average of 2,500,000 florins for church buildings, education, and charity, from the time of his appointment to the See of Raab till his death. The cardinal was rough and outspoken and of a determined disposition. The last year of his life was embittered by his quarrel with the Government on the subject of the baptism of children of mixed marriages, in which the parish clergy refused to follow his dictates, and left him helpless when he tried to effect a compromise.

Smith, William Henry, an English statesman, born in London, June 24, 1825; died at Walmer Castle, Oct. 6, 1891. He was the son of William Henry Smith, who established in the Strand a business for distributing newspapers and periodicals, which passed into his own hands, and grew to enormous proportions in connection with the sale of books and periodicals at the railroad stations that became almost a monopoly in his hands. At the age of forty he found time to gratify his ambition for political honors. He presented himself as a Conservative candidate in 1865 for the representation of Westminster, where his business was situated, and though he was opposed by John Stuart Mill and one of the Grosvenor family, which owned a great part of Westminster, both members of the Liberal party, which had always been in the ascendancy in Westminster, he ran behind only about 700 votes. In 1868 the conditions were changed by the reform bill, which had been opposed by the Duke of Westminster, and had operated favorably to the Conservatives in most London constituencies. In that year Mr. Smith was returned at the head of the poll, while the Duke of Westminster's relative came in second, and Mr. Mill last. It was considered a great party victory to win a seat in the stronghold of Liberalism, and therefore he took at once a prominent position in the Conservative ranks, the more so because he was a man of the people, not one of the aristocratic Tories, and represented the democratic tendencies suited to the enlarged borough franchise. When he first turned his attention to politics he was a Whig, and he became a Tory because the Reform Club was too exclusive to receive a man engaged in the retail trade. In Parliament he had many opportunities of displaying his political sagacity and business capacity without making himself obtrusively conspicuous. He was prominent before the public also as an active member of the first London School Board, and in 1874 he was returned for Westminster by a majority of nearly three to one. Mr. Disraeli, who had already marked him out as the middle-class representative that he needed to strengthen his Cabinet, made him Financial Secretary of the Treasury, and in 1877 promoted him to the place of First Lord of the Admiralty, in which he made a good record. When his party was swept out of power in the general election for 1880 he retained his seat, and while in Opposition he spoke, not often, but effectively, on financial, naval, and business questions, criticising the Government severely in 1884 for not keeping the navy in a condition to meet the growing demands upon it. When Lord Salisbury formed a Cabinet in 1885 he made Mr. Smith Secretary for War. On the resignation of Sir William Hart Dyke as Chief Secretary for Ireland he accepted the post, but the Government was overturned not a week after his transfer. On the formation of Lord Salisbury's second Cabinet, in the summer of 1886, he returned to his former place as Secretary of State for War, and again he had not sufficient opportunity to direct his business talent to the reorganization of this great spending department, for the resignation of Lord Randolph Churchill made Mr. Goschen Chancellor of the Exchequer, while the

leadership of the House was given to Mr. Smith, with the office of First Lord of the Treasury, the one usually held by the Prime Minister. Many Conservatives looked on Mr. Smith's rapid rise unfavorably, and mistrusted his capabilities as leader of the House of Commons, for he made no pretensions to eloquence and lacked every element of the distinguishing culture of the English statesman. Notwithstanding this, he was remarkably successful as the leader of the party, and by his plain honesty, lucid explanations, moderation of speech, absence of bitter partisanship, and suavity he won the respect of both sides of the House. On the death of Lord Granville the Queen appointed him Warden of the Cinq Ports, which gave him the right to occupy Walmer Castle.

Springer, Anton, a German historian and critic, born in 1825; died in Leipsic, May 31, 1891. He was a professor in the University of Leipsic, and the author of works of high repute on the history of art, among them a hand-book of the history of the fine arts, a review of the history of art in the nineteenth century, and a study of Raphael and Michael Angelo. He also published a "History of Austria since the Congress of Vienna."

Steel, Sir John, a Scotch sculptor, born in Aberdeen in 1804; died in Edinburgh, Sept. 15, 1891. He was educated in Edinburgh, studied art for several years in Rome, returned to Scotland in 1833, and acquired an immediate reputation through his colossal design of "Alexander taming Bucephalus," which has only recently been cast in bronze and erected in Edinburgh. He made the statue of Queen Victoria for the Royal Institution in Edinburgh, the statue of Sir Walter Scott for the Scott monument in that city, the medallion portrait of Scott in Westminster Abbey, and statues and busts of many eminent people. He made a statue of Robert Burns for the city of New York. One of his most famous works is the equestrian statue of the Duke of Wellington, in Edinburgh, and the most elaborate is the Scottish national memorial of Prince Albert, at the unveiling of which, in 1876, he received the order of knighthood.

Sullivan, Barry, an English tragedian, born in Birmingham in 1824; died in Brighton, May 3, 1891. He made his first appearance on the boards at Cork in 1840, joined soon afterward the company of the Theatre Royal in Edinburgh, and after remaining there for several seasons traveled through the provinces. His first London appearance was at the Haymarket in 1851 as Hamlet, in which he scored a success. His reputation grew, and when he went to the United States and Canada in 1857 he was received with enthusiasm, and did not return to England until 1860. A year later he went to Australia, where he remained five years, meeting with an extraordinary greeting in every city. In Melbourne he played for 1,000 nights. Returning to England by way of India in 1866, he afterward appeared in Shakespearean characters, and for some time was the lessee of Holborn Theatre. Of late years he has played mostly in provincial towns.

Sutherland, John, an English sanitarian, born about 1820; died in Norwood, July 14, 1891. He was educated for a physician and practiced for a short period in Liverpool, where he became known to the public as a sanitary reformer through the "Health of Towns Journal," which he edited. In 1848 he entered the Government service under the first Board of Health. He was a representative of Great Britain at the Paris Conference of 1851 to regulate quarantine law. In 1855 he was engaged in carrying into effect the law abolishing intramural interments, and was afterward placed at the head of a commission sent to the Crimea to inquire into the health of the troops. He served on a commission on the sanitary condition of the British army in 1858 and on one on the army in India in 1863, suggested important improvements in barracks and hospitals, and was engaged in carrying out this work till his retirement, in 1888.

Tamasese, ex-King of Samoa, born about 1830; died in Lufilufi, April 17, 1891. When the Germans at-

tempted to establish a protectorate over the Samoan Islands in 1888 they took advantage of one of the feuds between the chiefs which have depopulated the islands since the introduction of fire-arms to depose Malietoa, who had established his rule over the whole group and set up in his place Tanamasese. Prince Bismarck decided not to carry out the annexation when he found that the United States Government would treat it as an unfriendly act. Tanamasese was supported by only a small part of the people, and by agreement of the United States, Germany, and Great Britain, Malietoa was restored, although the people preferred Mataafa, who had led them against Tanamasese after Malietoa's deportation. Tanamasese and his followers soon ceased to struggle against the decision of the powers, while Mataafa continued the war against Malietoa.

Taubert, Wilhelm, a German musician, born in 1812; died in Berlin, Jan. 7, 1891. He was director of the Berlin court concerts, with the title of chief chapel-master from 1831 till 1887, and from 1840 till 1871 he was leader of the orchestra of the opera house. He was the author of a great number of orchestral pieces, among them the operatic score for Shakespeare's "Tempest." He succeeded also in light pieces, and leaves to the world several collections of musical trifles, "Kinderseenen" and others, sprightly and full of fancy and humor.

Téti, Cléophas, known as Sister **Thérèse**, a Canadian missionary, born in 1824; died in Montreal about Dec. 1, 1891. She was the daughter of a notary, and entered the order of the Sisters of Providence in 1844. Sent with another nun to the Indians of the far West in 1852, she traveled on horseback almost to the Pacific coast, and in a region where no white woman had been seen before she acquired a remarkable influence over the savages. In 1857 she went to Chili to establish a home for abandoned children. She was made treasurer of the order in 1866, and soon after taking up her residence in Montreal she founded the great insane asylum, the buildings of which were burned with 100 patients in 1890. Of this establishment she was mother superior till the time of her death. She had extraordinary influence over violent lunatics, and possessed a degree of resolution and eloquence that gained her point whenever she made a demand on the Quebec Government for money.

Vela, Vincenzo, an Italian sculptor, born in Lignoretto, Ticino, in 1822; died there, Oct. 5, 1891. He was the son of poor peasants, and was employed at the age of twelve in a stone quarry. Manifesting great aptitude for sculpture, he was sent by friends to Milan in 1836, was employed in the restoration of the cathedral, and studied under Cacciatori. In 1848 he took a prize with his bas-relief "Christ restoring the Daughter of Jairus." He first achieved a reputation with his statue of "Prayer." Called back to Switzerland to take part in the war of the Sonderbund, he fought afterward in the Italian revolution of 1848. After the campaign was over he went to Rome, where he modeled his "Spartacus," which attracted much attention in the Paris Exhibition of 1855. He settled for a time in Turin, producing "Hope" and "Resignation," and at Bergamos he made "Harmony in Tears" for the tomb of Donizetti. At the Paris Exhibition of 1863 he showed "France and Italy," which was presented to the Empress Eugénie by the ladies of Milan, and won for the sculptor the decoration of the Legion of Honor. He subsequently sent other works to the Paris Salon, receiving a first medal in 1867.

Vita, Auguste, a French dramatic critic, born in Meudon in 1823; died in Paris, Aug. 5, 1891. He learned the printer's trade, obtained a public office, wrote some small comedies for minor theatres, and before he was twenty years old entered the field of journalism as a contributor to the "Mercure des Théâtres" and "Charivari," his articles in which have been published in book form. In the revolutionary period between 1848 and 1851 he was an active political journalist, starting various short-lived journals in Paris and the provinces. He pub-

lished a book called "Révision on Révolution," giving his views on universal suffrage. At the time of the *coup d'état* he was a partisan of Louis Napoleon, and he obtained a municipal office which kept him out of journalism for some years. Resuming his newspaper career, he became a recognized authority on finance, editing influential commercial journals and publishing a "Guide Financier," which has been the model for many succeeding books. Since 1870 he has devoted himself entirely to dramatic criticism. As critic for the "Figaro" he wielded an influence necessarily great, which was enhanced by the honesty, intelligence, and discrimination of his judgments, less labored and polished than those of the weekly writers, but equally critical and more effective in guiding public taste.

Waring, Edward John, an English medical author, born in Tiverton, Devonshire, Dec. 14, 1819; died in London, Jan. 22, 1891. He was the son of a captain in the British navy. He sailed as a ship's surgeon to Sierra Leone in 1841, afterward passed his medical examination in the College of Surgeons, and was health officer in Jamaica in 1842-43, and afterward as agent of the Emigration Commission he visited the United States and the various British dependencies. In 1849 he went to India as an army surgeon, and while stationed at Mergui, in Tenasserim, he compiled his "Manual of Practical Therapeutics" (London, 1854). Finding the supply of drugs running short in his station, he sought for substitutes among native remedial agents sold in the bazars and in plants of the neighboring forests, and published a volume on the results of his investigations, which he followed up after his return from England in 1853, in which year he became physician at the Residency in Travancore. In 1856 the Maharajah of Travancore made him court physician. In 1860 he published "Bazar Medicines," Materials collected for an "Encyclopædia Therapeutica" that he never completed were utilized partly in his "Bibliotheca Therapeutica" (1869) and partly in "Mayne's Lexicon." He returned to England in 1863, and in 1865 was selected as chief editor of the "Pharmacopœia for India," which was completed in 1868. He published also "Tropical Resident at Home" (1866), "Cottage Hospitals" (1867), and religious books. Both in India and in London he organized benevolent and missionary enterprises.

Weber, Wilhelm Eduard, a German physicist, died in Göttingen, June 24, 1891. He gave his attention chiefly to electro-dynamics, and in this field his researches were extensive and thorough. He is said to have produced the first electro-magnetic telegraph, with which he experimented successfully in 1833.

Weiss, Jean Jacques, a French author, born in 1829; died in Fontainebleau, May 19, 1891. He was the son of a Swiss soldier in the French service, was educated in the Ecole Normale, was a teacher for some years in provincial academies, and then became a journalist in Paris and wrote articles for the "Courier de Paris" and other papers, assailing the empire in skillfully guarded phrases. When Ollivier formed his Liberal ministry in 1870, the two sharpest satirists of the Opposition press—Prévost-Paradol and Weiss—accepted office under the empire, the former becoming minister at Washington and the latter Director of Fine Arts. After the fall of the empire he edited a newspaper of vague and uncertain political character. During the siege of Paris he bribed the valet of Mr. Washburne to bring him at night the American minister's copy of the London "Times," and from it he extracted facts and political secrets and published them in his paper, to the bewilderment of the Government authorities. When peace was established he joined in the attacks on M. Thiers, and when the Republican President was ousted he was rewarded by being made a counselor of state. By supporting the anti-Republican combination in 1877 he sacrificed his influence and reputation as a political writer. Nevertheless M. Gambetta appointed him to a high place, that of director of the political department in the Ministry of Foreign Affairs, and

by so doing he provoked an outcry that contributed to his own downfall. Returning to journalism, Weiss undertook for a time the dramatic *feuilleton* for the "Journal des Débats," which he abandoned to devote himself to literature. He was the author of several able works, and for the last six years of his life was librarian at Fontainebleau.

Whichcote, George, an English soldier, born in Lincolnshire, Dec. 21, 1794; died near Coventry, Aug. 26, 1891. He was a son of Sir Thomas Whichcote, was educated at Rugby, and on leaving school entered the army, receiving his commission in January, 1811, and was sent to the Peninsula and took part in the severe fighting under Wellington, being present at Sabugal, El Bodon, Alfayates, the storming of Rederigo, Badajos, and the battles of Salamanca, Vera, Vittoria, Pyrenees, Nivelle, Orthes, Tarbes, and Toulouse. At Waterloo he commanded a company of the 52d Regiment, which played an important part in the events of the day. He was promoted captain in 1818, major in 1825 (when he was retired on half-pay), lieutenant-colonel in 1838, colonel in 1851, major-general in 1857, lieutenant-general in 1864, and general in 1871.

White, Sir William Arthur, an English diplomatist, born in 1822; died in Berlin, Dec. 28, 1891. The son of a petty consular official of Irish origin, he learned from Polish family connections to speak Polish and German so well, that his English always retained a foreign accent, although he was educated on the Isle of Man and at Cambridge. He was therefore specially fitted for the appointment that he received of secretary to the British consul-general at Warsaw in 1857, at a time when a new fermentation was arising in Poland. He performed the duties that were committed to him with tact and discretion, was acting consul-general for a time, was made vice-consul in 1861, and in 1864 was promoted to be consul at Dantsic, while continuing for a year longer to conduct the affairs of the consulate-general in Warsaw. In 1866 he went for six months to Belgium as acting consul-general, and then proceeded to his post at Dantsic, where he remained nine years. His familiarity with Slavonic languages and with the political doings of Russia in the East were of service to the Foreign Office, marking him as the proper man for the post of political agent and consul-general at Belgrade in 1875, when the movement began that resulted in the Servian war and the Russo-Turkish war. He had thus crossed the border line between the consular and the diplomatic service, but would probably have never reached the upper grades, which are the prizes for the diplomatic guild of the aristocracy, had not Lord Salisbury, whom he assisted as a specialist at the conference in Constantinople, noted his remarkable knowledge and ability. From him the Foreign Minister gained much of the information that caused him to amend his views on the Eastern question. He went to the Berlin Conference as an expert, and for the services that he had rendered in the preceding three years he was appointed minister at Bucharest, afterward received the honor of knighthood, and from this period stood in the forefront of events, was recognized as the greatest authority on the Eastern question, and had the first claim to the succession of the embassy at Constantinople. His opinions were decisive before he was sent on special missions to Constantinople in 1885 and 1886. It was his advice that determined the attitude taken up by the British Government toward Bulgaria at the time of the annexation of Eastern Roumelia and maintained ever since. On Oct. 11, 1886, he was appointed ambassador to the Porte. His frank and open manner, his resounding voice and imposing personality, his penetration and ready memory, his store of information gathered from all sorts of people and from newspapers, his sagacity and fine tact, impressed the Turks from the Sultan down, and gave him a personal power and influence over his fellow-diplomats at Constantinople that even the Russians recognized by calling him the English *Ignatieff*. In England he

was appreciated by Liberals and Tories alike as the greatest expert in Eastern affairs that was ever sent to the Golden Horn, not less sagacious and adroit than Lord Stratford de Redcliffe, and one whose place it will be equally hard to fill. He took a leave of absence in June, 1891, to enjoy a vacation in Germany, and died suddenly from an attack of influenza.

Wills, William Gorman, a British dramatist, born in County Kilkenny, Ireland, in 1830; died in London, Dec. 14, 1891. He was graduated with honors at Trinity College, Dublin, studied art in that city, and won some reputation as a painter of portraits. At the age of twenty-seven he produced a successful play, "The Man o' Airlie," which was placed on the stage in the United States by Lawrence Barrett. His "Charles I" was the play in which Henry Irving won his first renown as a tragedian, and the same actor presented his "Eugene Aram" and "Vanderdecken." "Jane Shore" was brought out in New York by Genevieve Ward and "Olivia" by Fanny Davenport. Other popular pieces written by him are "Nell Gwynn" and "William and Susan." His last work, "A Royal Divorce," founded on the story of Bonaparte and Josephine, was produced in London a few months before his death by Grace Hawthorne. He was the author of several novels, of which "Notice to Quit" and "Wife's Evidence" were republished in the United States.

Windthorst, Ludwig, a German statesman, born in Kaldenhof, Hanover, Jan. 17, 1812; died in Berlin, March 14, 1891. He was the son of Catholic parents,

and his father, a wealthy farmer, sent him to the ancient Carolinum Gymnasium in the neighboring town of Osnabrück to prepare for entrance in a theological seminary. Preferring a legal career, he studied in Göttingen and Heidelberg, gained a reputation as attorney for Catholic societies, was appointed chief judge of the Court of Appeals at Celle in 1843, and in the following year entered the Second Chamber of Hanover, in which he supported the Particularistic or anti-Prussian party, and took so prominent a position that he became leader of the Ministerial party, and in 1851 was elected president. Soon afterward he was called into the Cabinet as Minister of Justice. This post he held from November, 1851, till 1853, winning much influence over King Georg V, whom he persuaded to receive Catholics at court. In 1862 he was again appointed Minister of Justice in the Brandis-Platen ministry, which favored an alliance with Austria against Prussia. On his retirement, he was appointed, in October, 1865, chief syndic of the Crown at Celle. After the annexation of Hanover by Prussia he was the King's representative in the negotiations with Prince Bismarck for compensation, which resulted in the treaty of Sept. 29, 1867, and till the end of his life he acted as legal counsel and political representative of the family of the Guelphs.

In 1867 he was elected to the North German Parliament and to the Prussian House of Deputies as representative of the district of Meppen, and in both bodies he displayed untiring activity as leader of the Catholic or Center party. It was largely his political genius, his tenacity of purpose, supple adaptability, readiness of resource, power of management, sagacious insight, force of character, moral ascendancy over others, diplomatic tact, tactical skill, and unrivaled dialectical and oratorical talents that created and held together the great Center party, which was an instrument in his hands for the achievement of successes that were remarkable, measured by the difficulties under which they were accomplished. He was the leader and the autocrat of the Ultramontane party from the opening of the first German Reichstag in March, 1871. For sixteen years he conducted the Kulturkampf against the May laws of 1873, and held together the Center party, harmonizing the conflicting factions and interests, and inventing, always at the right moment, the war cry that rallied the electors to the party standard, and at length he triumphed over the dominant tendencies of the age and compelled Prince Bismarck to sue for peace. Of all the debaters in the Reichstag he was the one whom Bismarck feared and respected most, the only one who almost invariably carried off the honors of the battle in an oratorical duel. The Clericals were the most numerous faction in the Reichstag and next to the strongest in the Prussian Landtag. With their natural allies, the Guelph, Polish, and Alsatian Particularists, who usually followed Windthorst's dictation, they were led by him into temporary combinations with Conservatives, or Progressists, or Socialists against Bismarck, or supported his measures against the Opposition, always exacting a concession for their aid, until little was left of the Falk laws in May, 1889, when the Chancellor completed his pilgrimage to "Canossa" by repealing the remnant. Between 1881 and 1887, after the disruption of the National Liberals, which he had helped to bring about by supporting Bismarck's protective policy in 1879, Windthorst often found himself at the head of a majority of the Reichstag. The "Pearl of Meppen," as he was nicknamed, was diminutive in stature, as was indicated by the other facetious epithet, "his little Excellency," and his face was exceedingly homely except when brightened in the animation of speaking. His speeches were smooth and diplomatic, his manner insinuating and conciliatory, his expressions always cautious and guarded, his statements of fact infallibly exact, and his incisive wit and fine irony were never unkind and left no rankling wound. It was only when vaunting the greatness and glory of the Catholic Church, and bewailing its wrongs, that he allowed his imagination free play and rose to passionate eloquence.

Wingfield, Lewis, an English author, born in 1842; died in London, Nov. 12, 1891. He was a brother of the present Lord Powerscourt. He received his education at Eton College and the University of Bonn, and passed an active and adventurous life, being at various periods an artist, an actor, an author, a critic, a surgeon, an explorer, and a war correspondent. He traveled extensively in the East, became familiar with Oriental life, and was one of the earliest foreigners to obtain permission to visit the interior provinces of China. During the Franco-Prussian War and in the operations against the Commune in Paris he labored in the ambulance department. Recently he has utilized his antiquarian knowledge in arranging costumes and scenery for the presentation of Shakespearean plays. His most popular books are "Lady Grizell" and the "Globe-Trotter."

Wolf, Albert, a French journalist, born near Cologne, Germany, Jan. 1, 1827; died in Paris, Dec. 22, 1891. He was educated in Germany, studying philosophy at Bonn and painting in Düsseldorf; began newspaper work there, and published a volume of stories and a humorous book on the Rhine voyage, illustrated by himself. Soon after his arrival in Paris in 1857,

whether he went as correspondent of the Augsburg "Allgemeine Zeitung," but was discharged after his second letter, he adapted himself to French taste and ways, yet it was long before he was able to obtain a living. He was patronized by Alexander Dumas, who made him his secretary. M. Villemessant, the editor of the "Figaro," rejected many of his articles before he was accepted as a regular contributor. During the Franco-Prussian War he retired to Belgium, being a Prussian citizen. Afterward he returned and was naturalized. In his writings he was intensely hostile to Germany. When the first Bayreuth festival occurred he reported it, and covered the Wagnerian music with ridicule. His caustic comments and epigrammatic criticisms on art, literature, music, drama, were read with keen interest, and he formed a style both in criticism and in political writing that has found many imitators. When M. Villemessant died he left the "Figaro" by will to M. Wolf and three other journalists. He was one of the first to introduce into journalism the daily review or chronicle, which was in fashion in the time of the empire. Six volumes of his "Chroniques" in the "Figaro" have been printed: "Voyages à travers la Monde," "L'Ecume de Paris," "La Haute Née," "La Capitale d'Art," "La Gloriette," and "La Gloire de Paris." The third of these is a collection of his comments on painters and sculptors, and what he has published in recent years has been chiefly confined to criticisms on exhibitions of paintings. He was a nephew of Jacques Offenbach, the composer.

Wyllie, Sir William, an English soldier, born in 1802; died in London, May 26, 1891. He entered the British army in 1818; sailed for India in the following year, and at the age of twenty commanded a detachment of three hundred native soldiers sent against the rebel Roop Singh in the Mahratta country. He commanded a detachment in Gujerrat in 1823, and in 1825 distinguished himself as adjutant of his regiment in an attack on the heights of Jerun in Cutch. As major of brigade to the Malwa field force in 1827, he showed such ability that he was selected to perform the same duties in the Afghan expedition of 1838. He was the first British officer to land on the banks of the Indus, and took a prominent part in the capture of Ghuznee and the occupation of Cabul. On returning to India he was engaged in the storming of Khelat. In 1840 he was adjutant-general of the force sent to relieve Sir William Nott at Candahar, and was present at the storming of the Hykulzye heights and the forcing of the Khojak pass. He next served in Sir Charles Napier's campaign for the conquest of Sind as assistant-adjutant-general, and was badly wounded at the battle of Meeanee. In 1844-'45 he commanded the force sent to suppress a rebellion in the southern Mahratta country, and subsequently he commanded the brigade at Ahmednuggur. He was colonel of a line regiment after the amalgamation of the East India Company's forces with the British army until he retired.

Yoshida Kyonari, Viscount, a Japanese diplomatist, born in Satsuma in 1844; died in Tokio, Aug. 17, 1891. He was the son of an impoverished family of the Satsuma aristocracy, and in his youth was clerk in the local public bureau till he entered the English school at Kagoshima at the age of seventeen, where he made such rapid progress that he was selected by the Prince of Satsuma to be educated abroad. He studied in University College, London, and afterward for six years in American colleges, returning to Japan in 1868 after the revolution. He was employed at first in the finance department of the new Government. In 1872 he was transferred to the Ministry of Foreign Affairs, being appointed on the commission then constituted for the purpose of devising a scheme for the revision of the treaties. In 1874 he was sent as minister plenipotentiary to Washington, where he remained until in 1878 he concluded a treaty conceding all that Japan contended for in regard to consular jurisdiction and the right to fix import duties, with a proviso that the treaty should not go into force until the other powers had agreed to accord the same rights.

All the powers of Japanese diplomacy have been constantly exerted to obtain from Great Britain and the other European powers the concessions that the United States are willing to accord and the equal treatment that is observed between civilized governments, and the realization seems further off now than when Viscount Yoshida made the treaty with the Government at Washington. He returned to Japan, became Assistant Minister of Foreign Affairs under Count Ito, and a member of the Senate and of the Privy Council, and devoted his whole mind and energy to the object of treaty revision.

Zaleski, Lieutenant von, a German soldier, born about 1865; died in Ilenza, East Africa, Aug. 18, 1891. He attended the Military Academy from 1882 till 1885, and on passing the officers' examination he entered, on Aug. 29, 1885, into the service of the German East Africa Company. He led several expeditions into the interior, founded the station of Usungula, and at the breaking out of the revolt of the coast tribes was commandant at the Pangani station. Joining Capt. Wissmann's force, he distinguished himself in the assault on Bushiri's camp, led a reconnoitering party to Dunda, and took part in the storming of Saadani, where he commanded a part of the assailing force and was at the front through all the battle. On July 30, 1891, he set out from Maroro at the head of a punitive expedition against the Wahehe marauders who made the caravan route unsafe. Penetrating their country, the expedition was caught in an ambuscade as it entered a wood between Lula and Mdawaro and was almost annihilated.

OHIO, a Central Western State, admitted to the Union in 1803; area, 39,964 square miles; population, according to last census (1890), 3,666,719, being the fourth in rank of the States. Capital, Columbus.

Government.—The State officers for the year were: Governor, James E. Campbell. Democrat; Lieutenant-Governor, William V. Marquis; Secretary of State, Daniel J. Ryan; Auditor of State, Ebenezer W. Poe; Treasurer of State, John C. Brown; Attorney-General, David K. Watson; Board of Public Works, C. A. Flickinger, Wells S. Jones, William M. Hahn; Commissioner of Common Schools, John Hancock; Judges of the Supreme Court, Thaddeus A. Minshall, Marshall J. Williams, William T. Spear, Joseph P. Bradbury, Franklin J. Dickman; Clerk of the Supreme Court, Urban H. Hester. All these officers, except the Governor and Lieutenant-Governor, were Republicans.

Finances.—The balance in the treasury at the beginning of the fiscal year was \$402,586.44. During the year the State's proportion of the direct tax refunded by the United States Government was received, amounting to \$1,332,025.93. The receipts from all other sources were \$5,737,263.93, making an aggregate of treasury resources of \$7,471,881.30. During the year the funded debt was reduced by the payment of \$250,000, and in addition bonds of the State Board of Agriculture were paid to the amount of \$67,739.63. The other disbursements were \$5,783,549.87, leaving a balance in the treasury at the end of the fiscal year of \$1,370,591.80.

Decennial Appraisalment.—The decennial valuation of the real property in the State was made in 1890 by the local assessors, and after revision by the county boards of equalization the returns were passed upon in 1891 by the State Board of Equalization. The county returns showed in general a considerable falling off in the value of farm lands, compared with the figures of

the preceding decennial valuation; but the complaint in nearly every instance was that the local valuations had been too high. The State board, in revising the returns, paid attention to those complaints, and transferred a considerable percentage of the total from farm to urban property. In 1880 the total valuation of real property in the State was \$1,097,509,830, of which \$684,826,516 was returned as farm property and \$412,683,314 as real property in cities, towns, and villages. The decennial valuation of 1890 as finally left by the State Board of Equalization in 1891 placed the total amount of real property at \$1,144,033,563, of which \$576,183,975 was farm property and \$567,849,587 real property in cities, towns, and villages. In 1880 the farm property formed 62 per cent. of the total, while in 1890 it had fallen to 50 per cent. There had been, according to the returns of the two periods, an actual depreciation in farm property of nearly 16 per cent. It must be understood that these are the figures for taxation only. While the Constitution requires that all property shall be taxed at its true value in money, the custom is to place the taxation value at about 40 per cent. of its selling value. The amount of farm lands in 1890 was returned at 25,319,698 acres, and the average taxable value per acre at \$22.76.

Agricultural Statistics.—The following statistics of agriculture in the State were compiled by the Secretary of State for his annual report for 1891: *Wheat*.—Acres sown in 1890, 2,266,012; bushels produced, 31,509,676; acres sown in 1891, 2,613,281. *Rye*.—Acres sown in 1890, 54,874; bushels produced, 618,238; acres sown in 1891, 67,062. *Buckwheat*.—Acres sown in 1890, 13,968; bushels produced 190,991. *Oats*.—Acres sown in 1890, 959,012; bushels produced, 19,049,033; acres sown in 1891, 886,946. *Barley*.—Acres sown in 1890, 31,446; bushels produced, 579,849; acres sown in 1891, 20,884. *Corn*.—Acres planted in 1890, 2,593,203; bushels (shelled) produced, 63,694,215; acres planted in 1891, 2,670,842. *Broom Corn*.—1,608 acres in 1890 yielded 564,998 pounds of broom brush. *Meadows*.—2,087,370 acres produced 2,863,284 tons of hay. *Clover*.—586,746 acres produced, tons of clover hay, 591,152; bushels of seed, 191,264. *Flax*.—18,056 acres produced, bushels of seed, 132,392; pounds of fiber, 3,704,111. *Potatoes*.—Acres planted in 1890, 114,569; bushels produced, 2,678,245; acres planted in 1891, 121,218. *Tobacco*.—39,283 acres produced 28,645,130 pounds. *Butter*.—Number pounds made in home dairies, 52,359,086; number pounds made in factories, 3,961,861. *Cheese*.—Number of pounds made in home dairies, 1,138,215; number of pounds made in factories, 17,080,062. *Sorghum*.—Acres planted, 6,577; pounds of sugar produced, 801; gallons of sirup produced, 415,282. *Maple*.—Number pounds of sugar, 1,465,972; number gallons of sirup, 997,148; number of trees tapped, 3,506,690. *Bees*.—Number of hives, 145,666; number of pounds of honey produced, 1,271,086. *Eggs*.—Number of dozens produced, 45,593,751, of which 1,328,919 were shipped beyond the State. *Grapes and Wine*.—Acres planted in 1890, 2,300; acres in vineyard in 1890, 24,870; pounds of grapes gathered, 25,027,289; gallons of wine pressed, 466,725. *Sweet Potatoes*.—Acres planted, 1,675; number of bushels pro-

duced, 123,548. *Orchards*.—Number of acres occupied, 383,718; bushels of apples produced, 1,731,491; bushels of peaches produced, 48,400; bushels of pears produced, 30,179; bushels of cherries produced, 14,231; bushels of plums produced, 9,173. *Lands owned in 1890*.—Number of acres cultivated, 9,697,085; number of acres of pasture, 6,237,610; number of acres of woodland, 3,768,038; number of acres lying waste, 454,461; total number of acres owned, 20,157,194. *Wool*.—Number of pounds shorn in 1890, 18,629,961. Number of milch cows, 613,507. Number of stallions, 6,060. Number of dogs, 153,892.

Legislative.—The adjourned session began Jan. 6 and closed May 4. The volume of laws enacted was larger than for many previous years. Among the more important were the following:

Providing for a secret ballot according to a modification of the Australian system. A "blanket ballot" is required, each party ticket on it to be headed by a distinctive device in addition to the name of the party. The State conventions subsequently held adopted the device of an American eagle for the Republican tickets, a rooster for the Democratic, a rose for the Prohibition, and a plow and hammer for the People's party. The law makes rigid provisions for secrecy and against corruption or intimidation.

Levying one twentieth of a mill on the grand duplicate for the support and maintenance of the Ohio State University, and giving all the State appropriation for colleges to the same university.

Increasing the amount of personal property allowed to be exempted from taxation from \$50 to \$100.

Disposing of the direct tax refunded by the General Government by placing \$1,000,000 to the credit of the sinking fund and \$332,000 to the credit of the general revenue fund.

Changing the system of compensation of county officials by paying salaries computed on the tax duplicates of the various counties.

Making it unlawful to employ in factories children under fourteen years of age.

The Corcoran building-and-loan association act places all such companies under the supervision of the superintendent of insurance, and provides for the appointment of an assistant. It also authorizes the codification of the laws governing the associations. It further provides that all foreign companies doing business in Ohio shall deposit \$100,000 in securities with the Treasurer of State as a guarantee to their patrons.

The Pennell school-book act constitutes the Governor and Secretary of State a commission to secure bids from and contract with school-book publishing houses to furnish the required text-books for a period of five years at a reduction of 25 per cent. from the present wholesale list prices.

The liquor question was dealt with in two laws. The Holliday law makes it unlawful for any minor to enter saloons. It imposes a fine against any saloon-keeper who knowingly permits a minor to remain in his place. Under this law both the minor and the saloon-keeper are amenable to the law. The Phillips law makes it unlawful to sell, vend, or traffic in intoxicating liquors in brothels.

Important insurance laws were enacted, among which are the following: To require life-insurance companies doing business in Ohio to make a detailed statement of expenditures to the commissioner of insurance, and prohibiting the use of such terms as "incidentals or all other expenditures," and also requiring that a statement be made to policy holders; to amend section 3654 so as to compel mutual companies organized under old charters to make return to the superintendent of insurance; amending section 3631 referring to assessment life associations so as to exempt ex-Union soldiers' organizations from the su-

pervision of the insurance department; amending sections 3634 and 3641 so as to provide for the formation and incorporation of live-stock insurance companies; preventing insurance companies from accepting risks sent them from agents outside of Ohio; amending section 282 by striking out the provision for computation, etc., and compelling every company to pay for each agent appointed, and giving the superintendent of insurance power to have policies of life-insurance companies valued and providing for payment of expenses; amending and supplementing section 3641 by providing for insurance against explosions and for insurance of employes; amending section 3669 by providing that no insurance company shall carry a case to the United States courts.

Regulating the employment of railroad engineers and conductors. No person can act as a conductor of any train unless he has had at least two years' experience as trainman or brakeman within five years next preceding his employment as conductor, and before any person is eligible to employment as an engineer he must have had at least three years' experience as a fireman.

Preferring \$300 for labor performed, in all cases of assignment, over all other claims.

Permitting the wife or husband to testify, in divorce or alimony proceedings, as fully as other persons.

Appropriating \$100,000 to secure an Ohio exhibit at the World's Fair in Chicago.

Appropriating \$40,000 for the preliminary steps toward the establishment of an epileptic asylum at Gallipolis.

Raising the age of consent from fourteen to sixteen years.

An amendment to the taxation clause of the Constitution was submitted for popular decision, providing that "laws may be passed taxing rights, privileges, franchises, and such other subject matters as the Legislature may direct."

Municipal Government.—A radical departure in the system of municipal government in Ohio was made by the enactment of a law affecting the city of Cleveland only. The law, which in its main provisions was the outcome of a popular movement in that city irrespective of party, completely divorces the legislative and executive functions of the municipal government, the former being confined to a city council of twenty members elected in ten districts, and the latter given into the control of the mayor, elected for two years by the people. The mayor appoints, with the approval of the council, six heads of departments, who, with him, form an executive board of control. Each head of department appoints his subordinates. The mayor can arbitrarily remove any member of the force, but when the head of a department removes a subordinate he must file written reasons with the mayor. The law went into effect at the April election.

The Supreme Court made an important decision in regard to legislation on municipal government in a case coming from Cincinnati. The State Constitution prohibits special legislation. The law passed at the extraordinary session of the Legislature in October, 1890, abolished the board of public improvements in Cincinnati, and substituted a board of city affairs, to be appointed by the mayor, and the bonds of the members to be approved by the judges of the Superior Court and the city solicitor. Cincinnati was not named in the act, which was made to apply to a "city of the first grade of the first class." The ousted members of the board of public improvements carried the case to the Su-

preme Court, on the ground that the law was special legislation. The majority of the court sustained the plea and declared the law unconstitutional, because no other city in the State has a superior court, which was created specially for Cincinnati.

Political.—The Prohibition State Convention was the first to be held. It met at Springfield, June 11. The platform denounced the liquor traffic; demanded revision of immigration and naturalization laws to prevent aliens voting until one year after naturalization; declared for woman suffrage; denounced speculation in margins; recommended pensions to soldiers and sailors, their widows and orphans, according to time of service. In addition it declared that

The tariff should be levied only as a defense against foreign governments that levy tariff upon or bar out our products from their markets, revenue being incidental; the residue of means necessary to an economical administration of government should be raised by a graduated income tax; non-residents, aliens, should not be allowed to acquire land in this country, and we favor the limitation of individual and corporate ownership of land; all unearned grants of land to railroad companies or other corporations should be reclaimed, and no further portion of the national domain should be thus granted; railroad, telegraph, and all other natural monopolies which owe their existence to grants of power from the people should be controlled by the people through their legislatures, in the interest of the people, and no higher charges allowed than necessary to make fair returns on capital actually invested. The circulation medium of the country may rightly consist of gold, silver, and paper. It should all be of full legal tender and sufficient in quantity to meet the demands of business and give full opportunity for the employment of labor. No private individual or corporation should be allowed to make any profit through issuing it. Neither should it be possible for any man or combination of men to produce an artificial scarcity and secure exorbitant rates.

The following nominations were made: Governor, J. J. Ashenhurst; Lieutenant-Governor, W. J. Kirkendall; Supreme Judge, Hewson L. Peeke; Attorney-General, W. H. Matthews; Treasurer, George W. Mace; Auditor, C. E. Reesor; Board of Public Works, P. A. Rodefer; School Commissioner, E. V. Zollars; Dairy Commissioner, Waldo F. Brown.

The Republican Convention was held at Columbus, June 16 and 17. The platform reaffirmed "devotion to the patriotic doctrine of protection," and recognized the McKinley bill as "the ablest expression of that principle, enacted in fulfillment of Republican promises," pledging the party to its support, "always having in view its improvement as changed conditions or experience may require." It favored "such legislation by Congress and in this State as will in every practicable mode encourage, protect, and promote the interests of agriculture in all its departments"; demanded "protection for the wool industry equal to that accorded to the most favored manufacturer of wool, so that in due time American wool growers will supply all wool of every kind required for consumption in the United States." On the money question it said: "Thoroughly believing that gold and silver should form the basis of all circulating medium, we indorse the amended coinage act of the last

Republican Congress, by which the entire production of the silver mines of the United States is added to the currency of the people." In the remaining resolutions of the platform the demand was made for "the enactment of laws that will protect our country and our people against the influx of the vicious and criminal classes of foreign nations, and the importation of laborers under contract to compete with our own citizens"; favoring "economy in the administration of national and State affairs, prompt and effective restraint of combinations of capitalists for purposes unlawful or at variance with sound public policy; ample educational facilities for the whole people; the reservation of the public lands of the United States for homesteads for American citizens, and the restoration of the public domain of all unearned railroad grants"; favoring "liberal pensions to the sailors and soldiers of the republic and a generous care of their widows and orphans"; approving the Harrison administration; commending the services of Senator Sherman and his Republican colleagues in Congress; approving the selection of Charles Foster for Secretary of the Treasury; and denouncing the Democratic State administration. The following ticket was nominated: Governor, William McKinley, Jr.; Lieutenant-Governor, Andrew L. Harris; Auditor, Ebenezer W. Poe; Treasurer, William T. Cope; Attorney-General, John K. Richards; Supreme Judge, Marshall J. Williams; Public Works, Charles E. Groce; School Commissioner, Oscar T. Corson; Dairy and Food Commissioner, F. B. McNeal.

The Democratic Convention was held at Cleveland, July 15 and 16. The platform approved the administration of Gov. Campbell and the Democratic Legislature, especially for having enacted a secret-ballot law. On tariff and finance it said:

We are opposed to all class legislation and believe in a tariff levied for the sole purpose of producing a revenue sufficient to defray the legitimate expenses of the Government, economically administered. We accept the issue tendered to us by the Republican party on the subject of the tariff, as represented by the so-called McKinley tariff act, confident that the verdict of the people of Ohio will be recorded against the iniquitous policy of so-called protection, championed by the Republican party in the interest of favored classes against the masses.

We favor a graded income tax.

We denounce the demonetization of silver in 1873 by the party then in power as an iniquitous alteration of the money standard in favor of creditors and against debtors, tax payers and producers, and which, by shutting off one of the sources of supply of primary money, operates continually to increase the value of gold, depress prices, hamper industry, and disparage enterprise; and we demand the reinstatement of the constitutional standard of both gold and silver with the equal right of each to free and unlimited coinage.

The platform denounced "the billion-dollar Congress"; congratulated the people "on the defeat of the odious force bill"; opposed the enactment of laws "which interfere unnecessarily with the habits and customs of any of our people which are not offensive to the moral sentiments of the civilized world"; favored laws giving a uniform system of municipal government in which executive and legislative powers shall be separated, the former to be lodged in a mayor

and the latter in a council, both to be elected by the people; favored closer commercial relations with Canada; just and liberal pensions to deserving and disabled soldiers and sailors who fought for the maintenance of the Government, and to their widows and orphan children; and expressed sympathy with the persecuted Jews in Russia. A minority report was presented, substituting the following for the coinage and income-tax plank:

We believe in honest money, the coinage of gold and silver, and circulating medium convertible into such money without loss; and we oppose all legislation which tends to drive either gold or silver out of circulation, and we believe in maintaining the coinage of both metals on a parity.

We also recommend that the resolution declaring for a graduated tax on incomes be stricken from the platform.

The minority report was defeated by a majority of 99 in a total vote of 700, and the platform was then adopted as reported by the majority of the committee. The ticket nominated was as follows: Governor, James E. Campbell; Lieutenant-Governor, William V. Marquis; Auditor of State, Thomas E. Peckinpaugh; Attorney-General, John P. Bailey; State Treasurer, C. F. Ackerman; Supreme Judge, Gustavus H. Wald; Commissioner of Schools, Charles C. Miller; Member Board of Public Works, John McNamara; Food and Dairy Commissioner, Ambrose J. Trumbo.

The People's party convention was held at Springfield, Aug. 6. The platform held that

"Labor is the basis of all wealth, happiness, and progress, and must have equal protection by the law"; that the Government shall be so administered as to secure equal rights to all people; that taxation, national, State, or municipal, shall not be used to build up one interest or class at the expense of another; the abolition of national banks as banks of issue and as a substitute for national-bank notes; that full legal-tender treasury notes be issued in sufficient volume to conduct the business of the country on a cash basis; payment of all bonds of the Government instead of refunding them in such money as they were originally made payable in; Government ownership of all the means of transportation and communication between and by the people of the United States; liberal pensions to all honorably discharged Union soldiers of the late civil war and generous care for their widows and orphans, and that the difference between the value of gold and greenbacks at the date of payment be made equal to gold, so as to place the soldier on the same footing as the bondholder has been; favored woman's suffrage, Government loans directly to individuals, free coinage of silver; opposed alien ownership of lands; and demanded that Congress devise a means of obtaining all land already owned by foreign syndicates; also demanded all lands held by railroads and other corporations in excess of what is actually needed be reclaimed by the Government and held for actual settlers only; demanded graduated tax on incomes.

On State matters the platform favored a constitutional amendment preventing changes in the forms of municipal government for partisan purposes and requiring the consent of the people to any such changes; also a constitutional amendment requiring submission of proposed legislation to the popular vote in certain conditions; the enactment and rigid enforcement of laws preventing gambling in futures; the election of United States Senators by the people; the

rigid enforcement of laws against the adulteration and counterfeiting of food and drink products; free school books and compulsory education. The Standard Oil Company was denounced for joining the trust and a demand made for the forfeiture of its charter. The following ticket was nominated: Governor, John Seitz; Lieutenant-Governor, Frank L. Rist; State Auditor, David W. Cooper; Attorney-General, Riall N. Smith; Treasurer, Henry Welf; Judge of Supreme Court, Alfred M. Yaple; School Commissioner, J. E. Peterson; Member Board of Public Works, J. S. Borror; Dairy and Food Commissioner, W. J. Weaver.

The canvass that followed the conventions was one of the most remarkable in the history of the State. The nomination by the Republicans of William McKinley, the reputed author of the new tariff law, forced the tariff issue sharply to the front, and the entire campaign was fought on national issues. Gov. Campbell was prevented by illness from taking an early part in the contest, but Major McKinley began making speeches throughout the State soon after the conventions had been held. The canvass was noticeable also for the entire absence of personalities, which had been an unpleasant feature of most previous gubernatorial campaigns in Ohio. The Republican and Democratic candidates were warm personal friends, and used their influence with their respective supporters to this end. Once during the campaign the two leading candidates met in joint debate at the village of Ada, crowds coming from the surrounding country to hear the discussion of the tariff. Much of the interest in the campaign arose from speculation as to the strength of the new People's party. In addition to the election of State officers, the people were to vote on a constitutional amendment enlarging the legislative power over taxation, and also on the question of holding a constitutional convention to revise the Constitution, that instrument requiring the submission of the question every twenty years. The election was held Nov. 3, with the following result: Governor, William McKinley, Jr. (Republican), 386,739; James E. Campbell (Democrat), 365,228; John J. Ashenhurst (Prohibition), 20,190; John Seitz (People's), 23,472; Republican plurality, 21,511. On the vote for the other offices the Republican plurality varied from 27,000 to 29,500. On the taxation amendment the vote was: Yes, 303,177; No, 65,014. On the Constitutional Convention—Yes, 99,784; No, 161,722. As the total vote cast at the election was 803,228, requiring 401,615 for the adoption of a constitutional amendment, both constitutional propositions were defeated.

OKLAHOMA, a Territory of the United States, organized by act of Congress approved May 2, 1890; area (including the Cherokee country and No Man's Land), 39,030 square miles; population (including Greer County, claimed by Texas), according to the census of 1890, 61,834. Capital, Guthrie.

Government.—The following were the Territorial officers during the year: Governor, George W. Steele, Republican, who resigned in October; Secretary and acting Governor after the Governor's resignation, Robert Martin; Treasurer, W. T. Higgin; Auditor and Superintendent of Pub-

lic Instruction, J. H. Lawhead; Attorney-General, Charles Brown; Chief Justice of the Supreme Court, Edward B. Green; Associate Justices, Abraham J. Seay and John G. Clark.

Valuations.—The assessed valuation of property in the Territory, as fixed this year for the first time by the first Territorial Board of Equalization, is as follows: Payne County, \$417,667.15; Oklahoma County, \$1,938,408.59; Logan County, \$1,278,080.69; Kingfisher county, \$779,890.92; Cleveland County, \$982,919.67; Canadian County, \$757,681.50; Beaver County, \$724,274.52; total, \$6,893,389.95. The rate of taxation for Territorial purposes in 1891 was 3 mills for the general revenue fund, $\frac{1}{2}$ mill for the university fund, and $\frac{1}{4}$ mill for the normal school fund.

Legislation.—The following is a summary of the more important enactments of the first Territorial Legislature, which adjourned on Dec. 24, 1890:

Assenting to the act of Congress establishing agricultural experiment stations in the various States.

Establishing an agricultural and mechanical college for the Territory, and locating it in Payne County, provided said county, or the municipality in which the college shall be located, shall appropriate \$10,000 therefor. Both sexes shall be admitted as students.

Providing for the appointment of a county inspector of hides and animals.

To prevent the importation of diseased cattle or cattle coming from infected districts.

To provide for the registration of stock brands or marks.

Prescribing the qualifications, powers, and duties of attorneys and counselors at law.

Creating a Territorial board of health, and prescribing the qualifications demanded of medical practitioners in the Territory.

Authorizing the issue of bonds for payment of the contingent expenses of the Territorial, county, and city governments until such times as revenue may be derived for that purpose from taxation.

Authorizing the county commissioners of each county to offer a bounty not to exceed \$3 for each gray wolf and \$1 for each coyote killed within the county.

Providing for the taking of a census of the Territory as of the first Monday of February, 1891.

Regulating conveyances of real property, and prescribing a short form for deeds and mortgages.

To regulate the practice of dentistry.

To regulate the sale of drugs, medicines, and poisons.

Providing a general law for the conduct of elections.

Authorizing each county to appoint a commissioner and a lady assistant, whose duty it shall be to procure an exhibition of the industries and resources of the Territory at the World's Columbian Exposition, and authorizing each county to expend not over \$1,000 therefor.

To prevent and punish the setting of prairie fires.

Providing a fish and game law.

Making provision for the care of the insane at some insane asylum in another Territory or State.

To incorporate and govern insurance companies doing business in the Territory.

To organize and regulate the business of life insurance.

To provide for the organization of the Legislative Assembly of the Territory.

Providing for a Territorial library.

Providing for the organization of a Territorial militia.

Locating and establishing a Territorial normal school at Edmond, in Oklahoma County, on a site

to be given to the institution, and authorizing said county to issue \$5,000 in bonds, the proceeds to be devoted to the school.

To regulate the settlement and support of the poor. Prescribing a code of civil procedure.

Establishing a system of public schools, at the head of which shall be a Territorial superintendent.

Creating the offices of Territorial Auditor, Territorial Treasurer, and Territorial Attorney-General, and prescribing the duties of each.

Defining the powers and duties of Governor.

Providing for the organization of municipal townships.

To prevent combinations in restraint of trade.

Locating at Norman, in Cleveland County, a Territorial university, provided 40 acres of land are given for its use, and authorizing that county to sell bonds to raise \$10,000, which shall be expended for buildings.

To provide for the security of bank depositors.

The election law of this session introduces the Australian or secret-ballot system. It provides that a Territorial board of three election commissioners shall prepare and distribute the ballots for the election of officers for whom all the electors of the Territory are entitled to vote, and that a county board of election commissioners in each county shall prepare and distribute the ballots for all other officers to be voted for in the county. Candidates must be nominated by the convention or caucus of a political party that cast 1 per cent of the total vote of the Territory in the last general election, or by nomination papers signed by 500 qualified electors when the candidate is to be voted for throughout the Territory, by 25 qualified electors if the candidate is to be nominated for a county office, for member of the Legislature, or for prosecuting attorney, and by 20 qualified electors, if for an officer of any township, ward, or other division less than a county. The names of all candidates filed with the respective boards of commissioners shall be printed on one ballot, all nominations of any party or group of petitioners being placed under the title and device of such party or petitioners. All ballots prepared by the Territorial board shall be printed on red tinted paper, and all prepared by the county boards on white paper. Polling places shall contain two booths, in which electors may prepare their ballots screened from observation. There shall also be provided a chute or passage-way with a railing, rope, or wire on each side, beginning 50 feet away from, and leading to each polling place past a window at which the elector may be challenged. On entering the room from the passage-way the elector shall receive from the poll clerks a Territorial and a local ballot and a stamp, shall enter one of the booths and prepare his ballot by stamping the square space opposite the name of the candidate for whom he wishes to vote; but a stamp opposite the party name shall be considered a vote for all the candidates of that party, except that if the elector also stamps the space opposite the name of one or more candidates of another party, he shall be considered to have voted for those, instead of the corresponding candidates of the party opposite to whose name he has stamped. All election days shall be legal holidays. The act shall take effect on and after March 1, 1891.

The liquor law prohibits selling on Sundays, on election days, and between the hours of twelve

and five in the morning. Gambling in saloons is prohibited. Sales to minors and to habitual drunkards are forbidden. The retail license fee is \$200, but cities and towns may impose an additional fee of from \$100 to \$500. The wholesale license fee is \$25. There shall be no screens, blinds, or painted windows to conceal the business of liquor selling.

Education.—A school system for the Territory was not provided by the first Legislature till late in the session. As a result, several districts failed to organize in time to have any schools during the first school year, which ended on June 30, 1891. In the act of May 2, 1890, organizing the Territory, Congress appropriated \$50,000 to provide temporary support for schools until taxes could be levied and collected therefor. Of this sum, \$37,581 were expended during the school year for salaries of teachers and \$3,439.17 for other school purposes. The following statistics cover the period from January to June 30, the first six months of the operation of the school law: School townships organized, 111; school districts organized, 400; school population, between six and twenty-one years, 21,337 (of whom 20,085 were white, and 1,252 colored); pupils enrolled in the public schools, 9,893; average daily attendance, 5,596; teachers employed, 438; average monthly salary of male teachers, \$32.56; average monthly salary of female teachers, \$27.12. During the year normal schools, lasting two weeks each, were held in each county in the Territory, at which 369 teachers were enrolled.

On Dec. 15 the first session of the Agricultural College was opened at Stillwater. This place was selected as the location for the institution by the commissioners in consideration of the gift of 200 acres of land adjoining the city as a site for the college.

Agriculture.—According to the report of the Governor in October there were then 1,000,453 acres used for farming in the Territory, of which 287,831 acres were fenced and 712,622 were unfenced. The value of the farms with improvements was \$4,938,630. The live-stock on hand on Feb. 2 was as follows: Horses, 16,003; mules, 3,296; cows, 16,709; other cattle, 42,825; sheep, 8,122; swine, 10,684. In the autumn of 1890 27,077 acres of land were sown for winter wheat, and in the spring of 1891 85,675 were prepared for corn, 7,770 for oats, 14,930 for sorghum, 300 for flax, 30,686 for cotton, 1,126 for broom corn, 272 for pea-nuts, 5,125 for Hungarian and millet, and 2,072 for Irish and sweet potatoes.

Statehood Convention.—So rapid was the growth of population in the Territory during the first year of its existence that before its close the people began to consider seriously the propriety of demanding admission to the Union as a State. The Territorial press united in urging Statehood, and a Territorial convention was called, to meet at Oklahoma City on Dec. 15, for the purpose of publicly expressing the popular will and of providing means to secure the end desired. The convention was largely attended by delegates from all parts of the Territory. There was considerable difference of opinion on the question whether the Territory should ask for admission as one or as two States, the delegates from the western section generally favoring two States, one in the east and one in the west; but

a majority of the convention decided in favor of a single State, and resolutions for the appointment of a committee to ask Congress for an enabling act were passed.

Indian Lands opened.—During the year, as a result of the action of Congress and the President, nearly 300,000 acres of land in the Territory formerly held by the Indians were opened to white settlers. By an act approved Feb. 13, Congress ratified the agreements made with the Sac and Fox Indians on June 12, 1890, and with the Iowa Indians on May 20, 1890, by the commissioners appointed by the President to treat with the Indian tribes of the Indian Territory, and by the same act it was provided that the lands ceded under these agreements should be opened for settlement. Later, there was incorporated in the Indian appropriations bill, which was approved March 3, a ratification of the agreements made by the same commissioners with Pottawatomie Indians on June 25, 1890, with the absentee Shawnees on June 26, 1890, and with the Cheyenne and Arapahoe tribes in October, 1890. All these agreements provided for the allotment of certain portions of the ceded Indian land in severalty to the members of each tribe, and for the opening of the remainder to white settlers. During the summer months such allotments were made for all the tribes except the Cheyennes and Arapahoes (the appropriation for this purpose in case of the latter tribes being exhausted before the allotment could be completed), and by proclamation on Sept. 18 the President declared the lands so ceded by the Sac and Fox, Iowa, Pottawatomie, and absentee Shawnee tribes to be open for settlement on Sept. 22 at twelve o'clock noon. The exact area opened, as stated in the proclamation, was 266,243 acres. There was a large gathering of intending settlers on the borders of the new lands, and when the appointed hour arrived a rush for locations began similar to that which occurred when the original Oklahoma lands were entered. Two counties were formed out of the new Territory, which adjoins the eastern border of the original Oklahoma, the respective county seats being named Tecumseh and Chandler. The lands of the Cheyennes and Arapahoes, which will be ready for settlement as soon as the allotments are made, contain about 3,000,000 acres. Agreements have been made during the year by the commissioners with the Wichitas, the Kickapoos, and the Tonkawas for the cession of other lands to the United States, negotiations for extinguishing the Indian title to the so-called Cherokee strip are already far advanced, and in the near future the area of Indian lands in the Territory will be reduced to small dimensions.

ONTARIO. By a recent delimitation the previously accepted boundaries of Ontario were extended north and west, so as to make the area of that province nearly equal to that of Quebec. Their present respective areas are stated to be: Quebec, 188,688, and Ontario, 181,100 square miles. The population of Ontario by the census of 1891 was 2,112,989, the increase for the preceding decade being 186,067, or at the rate of 9.65 per cent. As usual, the increase in cities, towns, and villages far exceeds that of the rural districts. The population of Toronto, the provincial capital, was found to have increased since

1881 to 181,220, or at the rate of 88.4 per cent. Ottawa, the Dominion capital, had enlarged its population during the decade at the rate of 41 per cent. Nearly all the other cities, towns, and villages show a large increase in population in proportion to the rural districts.

Legislative.—The legislative session, which was opened on Feb. 11, 1891, was the first session of the seventh Legislative Assembly of Ontario. The provincial general election which produced this House was a strictly party conflict, yet the issues were definite and distinct. The principal contention of the Opposition—sometimes called the Conservative or Tory party, led by Mr. W. R. Meredith, was in favor of reform of the educational institutions of the province and with especial view to the abolition of separate schools, or at least the sustentation of separate schools as a part of the common-school system of the province. In Ontario the Roman Catholics have the special privilege of maintaining their schools separate and apart from those of other religious denominations, or from the ordinary public schools. Protestants enjoy a like privilege in the province of Quebec, but in the latter province Roman Catholicism is a state church, and the schools which it sustains avowedly teach Roman Catholic religious tenets. The recent canvass in Ontario on these points was able and vigorous, but the efforts of the advocates of essentially free schools were in vain. As was shown during the ensuing session, the Mowat administration was, in a full House of 93 members, usually sustained by a majority of about 20 votes. In his speech at the opening of the legislative session of 1891 Lieut.-Gov. Campbell complimented the House on the advance made "toward a settlement of most of the long-pending differences between the province and the Dominion"; upon "the increasing interest which was taken in improved methods of agriculture"; in the work done in "promoting the public health"; in the "subject of prison reform"; and in that of the "fish and game laws." Among other matters to which he called attention he stated thus: "It having recently been ascertained beyond doubt that the province possesses immense deposits of nickel, a metal which is likely to be of great economic use and value in the immediate future, my advisers deemed the time opportune for making some changes in the laws relating to the sale of mining lands, and a part of the districts of Algoma and Nipissing, in and near the nickel-bearing region, was withdrawn from sale and location until you could be consulted. I commend to your attention a measure respecting our mining which is to be submitted for your consideration." The result of this intimation was the passing of important amendments to the "General Mining act," setting forth the prices of crown lands to be appropriated for mining purposes. The districts specially indicated for such appropriations are Algoma, Thunder Bay, and Nipissing, which are known to abound in silver, nickel, and copper, and the prices range from \$2 to \$4.50 an acre, according to location. The grantee of any mining location shall, during the seven years immediately following the date of his patent, expend in opening up his mines \$4 an acre if his patent exceeds 160 acres, and \$5 an acre if his area is less than 160 acres; and in default of such

expenditure his lands shall revert to the Crown. All ores and minerals mined upon such lands shall be subject to a royalty, if of silver, nickel, or nickel and copper, 3 per cent. All other ores, except iron, shall be subject to such royalty as shall be from time to time imposed by order in council not exceeding 3 per cent., and iron ore not exceeding 2 per cent. No royalty is to be collected until seven years after the date of the patent or lease, except as to those mines known to be rich in nickel; and as to these, until four years. Instead of granting mining lands in fee simple, the same may be leased for ten years; and such leases may, upon stipulated conditions, be renewed for further terms of ten and twenty years. The lessee may, at any time during his leasehold tenure, become the purchaser of the lands upon certain conditions. The other more important measures passed during the session were an act making certain improvements in the election laws; a series of acts consolidating, revising, and amending the laws respecting the education department, the public-schools acts, the act respecting truancy and compulsory school attendance, the high-schools act, and acts respecting industrial schools and the establishment of mining schools; and an act securing a lien to workmen on saw-logs. The financial affairs of the province were found to be in a satisfactory condition, and the receipts of revenue from all sources considerably exceeded the general expenditure.

OREGON, a Pacific Coast State, admitted to the Union Feb. 14, 1859; area, 96,030 square miles. The population, according to each decennial census since admission, was 52,465 in 1860; 90,923 in 1870; 174,768 in 1880; and 313,767 in 1890. Capital, Salem.

Government.—The following were the State officers during the year: Governor, Sylvester Pennoyer, Democrat; Secretary of State, Auditor, and Insurance Commissioner, George W. McBride, Republican; Treasurer, Philip Metshau; Attorney-General (an office created by the Legislature of this year), George E. Chamberlain, appointed May 20; Superintendent of Public Instruction, E. B. McElroy; Railroad Commissioners, J. H. Faull, George W. Colvig, and Robert Clow; Chief Justice of the Supreme Court, Reuben S. Strahan; Associate Justices, William P. Lord and Robert S. Bean.

Finances.—The balance in all funds of the State treasury on Jan. 12, 1891, was \$233,144.29, of which the general fund balance was \$47,664.71. The receipts of this fund for the year were not equal to the demands against it, so that before October the balance had been wiped out, and the State Treasurer was unable to pay warrants. This result was produced largely by the action of the Legislature in making greatly increased appropriations for the year. The actual payments from the general fund for the year amounted to \$508,580.49, while the receipts, including the balance of \$47,664.71, were slightly in excess of these figures, but there remained outstanding at the close of the year unpaid warrants amounting to about \$166,000.

The total taxable property of the State for 1891 was assessed at \$114,077,788, against \$101,593,341 for 1890. The tax rate for State purposes in 1891 was 4 mills for the general fund,

$\frac{1}{2}$ mill for the State university, and $\frac{1}{2}$ mill for the militia—a total of $4\frac{1}{2}$ mills.

There is no bonded State debt, except to the amount of \$1,665.40 on which interest has long since ceased.

Legislative Session.—The regular biennial session of the Legislative Assembly began on Jan. 12, and ended on Feb. 20. On Jan. 20 United States Senator John H. Mitchell, Republican, was re-elected for the term of six years, from March 3, by the following vote: Senate, Mitchell 22, B. Goldsmith (Democrat) 6; House, Mitchell 41, Goldsmith 19.

A new election law was enacted containing provisions for a secret ballot, according to the Australian system. Candidates whose names are entitled to appear on the official ballots provided by the act must be nominated either by a convention of delegates of a political party which at the preceding election cast at least 3 per cent. of the entire vote cast in the State, county, or district for which the nomination is made, or by an organized assembly containing at least 100 electors of the State or electoral division for which the nomination is made, or by nomination papers signed as follows: By at least 250 electors if the candidate is to be voted for by the electors of the State at large, by at least 50 electors if he is to be voted for by the electors of an electoral district or county, and by at least 10 electors in other cases. The official ballots shall be prepared by the respective county clerks, and shall be of uniform size. They must be printed in black ink upon white paper. They shall contain the names of all candidates duly nominated, arranged under the designation of the office in alphabetical order, according to surnames, except that the names of candidates for electors of President and Vice-President shall be arranged in groups, as presented in the several certificates of nomination. Blank spaces shall be left for writing in the names of other candidates. The ballots shall be printed so as to give each elector a clear opportunity to designate his choice of candidates, and his answers to questions submitted, by canceling or marking out the names of candidates who are not his choice, or the answer he does not wish to make. Each polling place shall be provided with at least one voting shelf or compartment for every 40 electors entitled to vote thereat. Before any elector receives his ballot, the ballot clerk shall write his own initials on the back thereof.

An act of great importance to eastern and southern Oregon provides for the regulation of irrigation. By its terms the use of waters in the lakes and running streams of the State for general rental, sale, or distribution for purposes of irrigation and supplying water for household and domestic consumption, and watering live stock upon dry lands of the State is declared a public use, and the right to collect rates therefor a franchise. A corporation formed for the above-mentioned purposes may appropriate water from its natural bed, and condemn rights of way for its ditch, rights of riparian proprietors, and lands for sites of reservoirs; but the right of way for the main line shall not exceed 100 feet in width, and for each distributing ditch 30 feet, and for a reservoir site 20 acres from one owner.

An act to increase the powers of the railroad commissioners requires all railroad corporations within ninety days after the passage of the act to furnish the commission with a schedule of charges for transportation. These are to be revised by the commission, and if the rates so fixed are not accepted by the corporations, suits may be begun by the commission to have such rates adjudged just and reasonable. The commission shall investigate all complaints against the railroad companies, and may bring suit in the circuit court in the name of the State to have its declarations enforced. The commission must make a semi-annual examination of all bridges, and if any are reported by them as unsafe and are not repaired within ten days the commission may stop trains from crossing such bridges.

For the purpose of aiding transportation on Columbia river an act was passed, constituting the Governor, Secretary of State, and State Treasurer a board of portage commissioners, with power to build, construct, run, equip, operate, and maintain a portage railway between the highest and lowest points of the navigable waters of Columbia river at the Cascades and between highest and lowest points of that river between the Dalles and Celilo. The sum of \$60,000 was appropriated for these improvements.

An act to promote the fishing industry provides that every person or corporation engaged in canning, preserving, dealing in, packing, shipping, buying from first hands, or speculating in salmon or any variety thereof, shall pay to the State Treasurer half of 1 cent apiece for Chinook salmon, and one-fourth of 1 cent apiece for "silversides." Persons and corporations engaged in this business on Columbia river and vicinity shall also pay one sixth of 1 cent for "steel heads" and one sixteenth of 1 cent for "blue backs." The money so collected shall be held as a fund for the benefit of the salmon industry.

A State board of equalization was established. The office of Attorney-General was created, and authority was given to the Governor to appoint an incumbent until the election of 1894.

The State was divided into two Congressional districts composed of the following counties:

1. Benton, Clackamas, Coos, Curry, Douglas, Jackson, Josephine, Klamath, Lake, Lane, Linn, Marion, Polk, Tillamook, Washington, and Yamhill.
2. Baker, Clatsop, Columbia, Crook, Gilliam, Grant, Harney, Malheur, Morrow, Multnomah, Sherman, Umatilla, Wallawa, and Wasco.

The sum of \$80,000 was appropriated for completing the dome of the Capitol building, providing heating apparatus therefor, and making other improvements therein.

Congress was memorialized in favor of action to secure the election of United States Senators by direct vote of the people.

Other acts of the session were as follow:

To regulate the manner of holding primary elections, and to prevent fraud and crime at such elections, in cities of 2,500 inhabitants or more.

To regulate the taking of salmon.

Establishing a State board of charities and corrections.

Assenting to the act of Congress appropriating money for the more complete endowment of colleges of agriculture and the mechanic arts, and appropriating \$25,000 for the erection of a dormitory and other

buildings at the State Agricultural College at Corvallis.

Appropriating \$1,000 to establish a library for the use of convicts in the State Penitentiary.

Giving to laborers and material men a lien upon mines for or on which their labor and material are used.

To punish minors over sixteen years of age for obtaining or attempting to obtain intoxicating liquors under false pretenses.

To make employes and laborers preferred creditors to the extent of \$100 each.

To protect the title of owners of floating logs, timber, and lumber.

Giving to any person who clears any land, or improves it by ditching, diking, or tiling a lien on such land for his labor.

To provide for the further establishment and development of the State Reform School.

Revising the law regulating liens of laborers in timber and logging camps.

To regulate the practice of pharmacy and the sale of poisons.

To license and regulate life and casualty insurance companies and societies.

Granting to railroads hereafter constructed a right of way through lands of the State on paying \$1 an acre therefor, and also the right to take timber, stone, and water, and necessary ground for depots, side tracks, turn tables, and water stations.

Education.—The following statistics cover the school year ending in 1891: Children of school age (four to twenty-one years), 106,172; children enrolled in public schools, 72,322; enrolled in private schools, 6,666; not attending any school, 29,616; male teachers in the public schools, 1,059; average monthly salary, \$49.10; female teachers, 1,582; average monthly salary, \$41.00; teachers in private schools, 296; value of school property, \$1,906,431.90; school districts in the State, 1,747; school-houses built during the year, 113. There are 50 universities, colleges, and academies in the State, employing 234 teachers and having 4,879 pupils.

The State Normal School at Monmouth is flourishing, the number of pupils in attendance at the close of this year being 345. At the State University 352 pupils were enrolled during the year ending in June, of whom 217 were in the collegiate department, 86 in the law department, and 20 in the medical department. The receipts for the year were \$27,996.12 and the disbursements \$25,368.20.

Insane Asylum.—There were 628 patients at the State Insane Asylum on Jan. 1. The number had increased to 722 on Nov. 1, and before the close of the year the limit to the capacity of the institution was reached. The increase of patients for the year was nearly equal to the total increase for the two preceding years.

The Prison.—At the close of the year there were 384 convicts in the State Penitentiary, of whom 217 were employed in the foundry, 44 were unable to work, 56 had no employment, and the remainder were engaged in and about the prison buildings.

Fisheries.—Statistics of the State Fish Commission, for 1891 show that there were packed on the Oregon side of Columbia river 245,550 cases of salmon, or 11,786,400 pounds, valued at \$1,227,750; Nehalem river, 3,500 cases, or 168,000 pounds, valued at \$14,000; Tillamook Bay, 3,850 cases, or 184,000 pounds, valued at \$15,400; Coquille river, 4,000 cases, or 192,000

pounds, valued at \$16,000; Rogue river, 21,000 cases, or 1,008,000 pounds, valued at \$105,000; total for Oregon, 277,900 cases, or 13,338,400 pounds, valued at \$1,378,150.

There are 13 canneries in Oregon on Columbia river, with buildings and machinery valued at \$180,000, and 12 in other parts of the State valued at \$56,000.

The total number of men employed in the fishing industry is 2,590; the average rate of wages for the fishing season \$245.06, and the total amount paid in wages \$634,720.

Hops.—The production of hops in 1890 in the State is shown by counties in the following table:

COUNTIES.	Acres.	Pounds.	Value.
Benton.....	16	15,180	\$5,768
Clackamas.....	370	439,022	98,407
Douglas.....	49	48,216	10,559
Josephine.....	55	55,330	8,562
Lane.....	750	829,128	248,466
Linn.....	400	406,602	120,192
Marion.....	985	1,287,582	357,805
Multnomah.....	7	12,097	4,190
Polk.....	244	437,568	131,726
Union.....	15	14,600	4,380
Washington.....	71	95,449	17,909
Yamhill.....	161	163,580	45,982
Total.....	3,228	3,811,349	\$1,047,224

Coal.—Out-croppings of coal have been found in nineteen counties in Oregon, both east and west of the Cascade range, but mining operations are reported only in Coos County. These mines are at Marshfield, on Coos bay. The Coos County field covers an area of several hundred square miles, and is a fair quality of lignite.

Portage Railroad.—The commission appointed by the Legislature this year to build portage railways around the rapids of Columbia river, after trying without success to obtain assistance from the United States, decided in May to apply all the money at their disposal to building and equipping a railway around the Cascades, so-called, in that river. An engineer was appointed, under whose direction the work had been nearly completed at the end of the year, at a cost within the appropriation. The length of the road is seven eighths of a mile.

The World's Fair.—The Legislature of this year adjourned without appropriating money to secure a State exhibit at the World's Fair, although a bill for that purpose was presented for its consideration. The State Board of Agriculture thereupon appointed a committee, which issued a call in March for a convention of representative men to meet at Portland on June 15. There were no substantial results from this movement, however, and in October the State Board of Commerce undertook the problem. A committee was appointed, and under its direction subscription papers were put in circulation, but up to the close of the year no encouraging progress had been made in raising funds.

Decision.—The State Supreme Court in April, in the case of Maxwell *vs.* Tillamook County, rendered a decision declaring unconstitutional an act of the Legislature of 1889 appropriating money to aid in building a wagon road in the defendant county. The act was found to be repugnant to the clause of the State Constitution forbidding local and special legislation.

P

PARAGUAY, a republic in South America. The Constitution of Nov. 25, 1870, vests the legislative power in a Senate and House of Deputies, the members of which are elected by direct suffrage, one Senator to 12,000 and one Deputy to 6,000 inhabitants. The President, who is elected for four years, exercises the executive power in consultation with a Cabinet of four ministers, who are responsible to Congress. Juan G. Gonzalez was elected President on Sept. 25, 1890. His Cabinet is composed of the following members: Juan C. Centurion, Secretary for Foreign Affairs; Juan Sosa, Minister of Finance; Dr. Carlos Gondra, Minister of Justice; and Gen. Duarte, Minister of War.

Area and Population.—The area of the republic is 91,970 square miles. The population was reduced by war from 1,337,439 in 1857 to 221,079 in 1873. The census of March 1, 1887, which is imperfect, made the population in that year 329,645, comprising 155,425 males and 174,220 females. This does not include about 60,000 half-civilized and 70,000 savage Indians. The number of foreigners was estimated at 17,000, of whom 5,000 are Argentinians, 2,500 Italians, 1,500 Spaniards, 1,150 Germans, 700 French, 600 Brazilians, 600 Swiss, 450 Austro-Hungarians, and 200 British. The number of immigrants in 1888 was 1,064; in 1889, 1,495; in 1890, 1,419. Asuncion, the capital, had 24,038 inhabitants in 1886. The Government maintains a military force of only 100 officers and 1,400 men, and has no navy except a screw steamer of 440 tons, carrying four guns, and two small river steamers.

Finances.—The receipts of the treasury in 1890 amounted to 2,736,113 pesos, of the approximate value of 66 cents. Of this sum, 1,183,426 pesos were derived from custom duties, 337,527 pesos from sales and leases of land, and 215,160 pesos from other sources. The disbursements were 2,116,357 pesos, 913,104 pesos being spent for war and the navy, 623,324 pesos for the interior, 193,569 pesos for financial administration, 284,511 pesos for justice, worship, and public instruction, and 101,849 pesos for foreign relations. The public debt on Jan. 1, 1890, amounted to 32,969,471 pesos, of which 23,701,046 pesos represent the external debt, 724,485 pesos the internal debt, 194,934 pesos deposits, 2,768,506 pesos floating liabilities, and 5,580,500 pesos cedulas.

Commerce and Agriculture.—The imports in 1890 were valued at \$2,726,000, and the exports at \$3,564,000. The principal exports are yerba or maté, called sometimes Paraguay tea, cigars and tobacco, hides and skins, oranges, and woods. There were 730,000 cattle in the country in 1887. The production of corn, wheat, rice, and manioc are not more than sufficient for home consumption. There are three agricultural settlements of foreigners assisted by the Government. The value of the public lands alienated during 1889-'90 was \$809,125, and the rent paid for Government forests in that year was \$14,045. The plants and trees growing wild in the country yield an extraordinary va-

riety of commercial products, including algaroba and quebracho for tanning; indigo, annatto, and many other coloring materials; palm, pine-apple, mapajo, and other fibers; copal, dragon's blood, gum elastic, and balsams in great variety; and copaiba, jalap, sarsaparilla, nux vomica, and other medicinal drugs. In 1889 there were 933 vessels, of 36,503 tons, entered and 930, of 33,735 tons, cleared at the port of Asuncion. This city is connected with Villa Rica by a railroad 92 miles long, on which the receipts in 1887 were 161,550 pesos and the expenses 111,337 pesos. Beyond Villa Rica an extension through the southern part of the republic in the direction of the Parana river had been carried 60 miles before the beginning of 1891. Another extension is projected, which will join the Brazilian system at Santos. About \$5,000,000 of English capital has recently been invested in the country. The Anglo-Paraguayan Company has bought a large tract in the neighborhood of Villa Rica for the purpose of settling an agricultural colony upon it. To encourage immigration the Government offers free passage to agricultural colonists and their families. The small farmers are now at a disadvantage, however, because the good land within access of the markets has been bought by companies which hold it for enhanced prices. The small breed of native Brazilian cattle is being improved by crosses with European stock. The Argentine crisis affected the banks and mercantile houses of Paraguay, and caused a decline in the exchange value of the paper money. Buenos Ayres speculators had begun to buy large quantities of land in Paraguay in the hope of an immediate rise. The crash has produced a check in the rate of progress and a withdrawal of capital.

Attempted Revolution.—The Liberals, who were defeated in the elections of 1890, attempted to overthrow President Gonzalez in October, 1891. A spirit of hostility to the Government had been growing for some time, and at last the opponents of the Administration collected and armed the most desperate of their adherents, issued an address to the people accusing the President of a tyrannical abuse of power and breaches of the Constitution, and, led by Major Vera and Deputy Machin, attacked the barracks at Asuncion, which were occupied by the regiment of Col. Mino. The fighting was fierce and bloody for a few minutes, and then both the leaders of the insurrection fell. The loss of their commanders demoralized the rebels, who broke and fled, leaving 10 killed besides their leaders. They escaped to the Argentine frontier and surrendered their weapons to the Argentine authorities. On the Government side Col. Mino, Col. Ossura, and 6 men were killed. This ended the revolution.

PATENTS. The receipts, expenditures, and work of the United States Patent Office for the three years ending Dec. 31, 1892, are condensed from the commissioner's reports in the table on the next page.

The number of the last patent issued in 1891 was 466,321. Connecticut still maintains her traditional leadership as regards ratio of patents to population (1 patent to 1,018 souls in 1891), but Massachusetts is close behind, with 1 patent to 1,055. South Carolina is at the foot of the list, with 1 patent to 23,492. To New York the largest number of patents have been issued in each of the three years under consideration—to wit, 4,288 in 1889, 4,585 in 1890, and 3,907 in 1891. England continues to hold first place among foreign nations in the procuring of American patents, and of her colonies Canada leads in inventiveness. It will be seen, on reference to the foregoing table, that the year 1891 falls slightly behind 1890 in the number of patents issued as well as in the principal totals. Such variations, however, characterize any given term of years, and have no especial significance.

The reports of the Commissioner of Patents during the three years under review have been of especial interest from the fact that the Hon. C. E. Mitchell, of Connecticut, became commissioner in March, 1889, and brought some new ideas to the management of the office. He found it necessary in each report to plead, as his predecessors had done, for increased room, for an increased number of assistants, and for better salaries in the case of those already employed. He was succeeded in office, Aug. 1, by W. E. Simonds.

The place of the Patent Office among the departments of the Government is in many respects unique. It alone of all the departments is self-supporting, and has now on the books of the treasury a very large sum to its credit. The

space at the disposal of the working force is totally inadequate. The rooms, omitting the store and reception rooms, number 48, and their combined capacity, deducting the space occupied by the necessary furniture, is 247,441 cubic feet. The number of occupants constantly employed during business hours is 270; the cubic feet of space per occupant is therefore 916 feet. The best authorities estimate the number of cubic feet reasonably required by each person at 4,000. The ingenuity of the officers is constantly taxed to its utmost to find storage room even for the copies of patents as they are printed from week to week. The actual cash income from the sale of these copies exceeds \$60,000 a year, yet they are stored in different parts of the building, on different floors, and so widely separated that the searcher for a particular patent may be obliged to go from one end of the building to another several times before he can determine the exact location of the file for which he is searching. During the past six years the patrons of the Patent Office—that is to say, the inventors and designers of the country at large—have paid into the Treasury over \$1,000,000 in excess of all expenditures, and the net income of each succeeding year has thus far invariably exceeded that of its predecessors. The present issue of the "Official Gazette" is 7,000 copies, of which 2,953 are furnished to subscribers at \$5 a year, and 3,576 are distributed to public libraries, members of Congress, and others who are entitled to them.

The halls of the model room now contain over 150,000 models, and the number added during

an average year is in excess of 500. The present practice of the office does not call for a model excepting when required by the commissioner, which, of course, reduces the amount of space requisite for keeping up the work of the department. There are, however, about 25,000 models already in the cases which require repairing. It is frequently necessary to refer to them in considering new applications for patents, and there is naturally a considerable amount of breakage and wear and tear. The models at present in hand are of almost inestimable benefit to inventors, by enabling the examiners to conduct their investigations with greater expedition than would otherwise be possible. The commissioner regards it as a public calamity that the office ever suspended the rule requiring models in all cases, and he considers its readoption as most desirable.

In connection with the commissioner's report for 1891 (published in the "Gazette" of Feb. 2, 1892) are several new appendixes of great historical interest, showing, with a completeness not before attempted, the relations of the Patent Office to the prosperity of the country.

An enormous majority of our great manufacturing interests were originally based upon inventions recorded in the Patent Office. The patent laws do not exist for the benefit of inventors so much as for the advantage of the public, and the sooner the representatives of the people can be made to understand this fact the sooner will the office be freed from the fetters that now limit its usefulness.

The Library.—In the Patent Office is a department known as the "Scientific Library," and during recent years much work has been done in arranging and indexing books and patents. The library contains about 60,000 volumes, and last year's expenditure for its support was \$2,670. Authority has been recently received from Congress to exchange the "Official Gazette" with other scientific publications, and this has practically resulted in an increase in the fund available for the purchase of books. In connection with the library work is a classified abridgment of the patents already issued, for the prosecution of which an appropriation of \$10,000 was made by Congress several years ago. No additional funds have been forthcoming, and that amount has already been expended.

Litigation.—1889. The Supreme Court of California, *Hill vs. Miller* in a case where an invention is specified as part of the capital stock of a partnership, held that a patent on the invention becomes partnership property.

Before the Supreme Court of Indiana it was held that the trade-mark "Akron Dental Rubber" was infringed by the legend "Non-secret dental vulcanite, made according to our analysis of the Akron Dental Rubber," the last three words being printed large and in red, while the rest of the inscription was small and black.

In the case of *Monroe vs. Bedell et al.* the Supreme Court of New York held that the adoption of the name "Old Sleuth" to describe a series of books did not give the plaintiff an exclusive right to the word "Sleuth" in the titles of books. The complaint was dismissed with costs.

The Supreme Court of Ohio, at Cincinnati, held that an article having a distinct commer-

cial value of its own can not be made a trade-mark by being attached to another article and sold with it. This case is known as "*Hoch et al. vs. Bishop et al.*" The instance in point was a scarf or other ornamental pin attached to the cigar and claimed as a trade-mark; the pin could readily be detached and used for personal adornment.

1890, March. United States Supreme Court, *Evory vs. Burt*. Patent 59,375, Nov. 6, 1866. Held to be for the manufactured article, not for a mode of producing. A mere improvement in degree is not invention.

A case of considerable interest has been tried in the Eastern District of Massachusetts, the Western District of Wisconsin, and the Northern District of Illinois, Judge Blodgett presiding in the latter instance. The Consolidated Roller Mill Company, it appears, holds patents relating to rollers used in mills, and claims exclusive rights thereon. If sustained, the company can claim royalty from nearly all proprietors of roller mills in the United States. In the two last of the courts named above the decision is adverse to the claimants, in the first it was in their favor, and it is understood that it will now be appealed to the Supreme Court.

The United States Supreme Court held that a United States patent is not terminated by the forfeiture for any reason of the corresponding foreign patent, but that it continues until the legal term of the foreign patent ends. This decision relieves American inventors of a very embarrassing condition. Heretofore if a foreign patent has been granted for an invention and an American patent taken out for the same, the lease of life of the latter was limited by that of the foreign patent, which was likely to come to an end at any time through non-payment of dues, which are usually in foreign countries arranged on an installment plan.

An official decision holds that an inventor who conceives and describes an invention in such a manner that another can construct the thing described is entitled to a patent as against an inventor whose conception was of later date but who filed his application first; this provided the original inventor uses reasonable diligence in perfecting his invention.

October. United States Circuit Court, Eastern District of Pennsylvania, Justice Butler, *Wright vs. Postel*. An improvement in card-gilding machines declared invalid because, though the inventor proved priority of invention, he did not use due diligence to perfect and patent his invention.

September. The United States Circuit Court of Massachusetts, Judge Colt, the Pullman Car Company *vs.* Boston and Albany Railroad, held that the Sessions and Pullman patents, 1887 and 1889, covered all devices involving hood or vestibule between railway carriages. This decision caused much adverse comment, as vestibules or hoods practically similar to the Pullman device were in use about 1860 on the Housatonic Railroad in Connecticut. Nevertheless, this objection has not been set aside.

July. The United States Circuit Court, Syracuse, N. Y., Judge Wallace, *Tibbe & Sons vs. Heineken*, for infringement of patent on corn-cob pipe, held that filling the cob from the outside with a plastic self-hardening cement was a

new invention and defensible under patent law, notwithstanding the established and common practice of filling pipes of this kind with a similar cement from within.

April, 1891. United States Supreme Court, opinion delivered by Mr. Justice Gray, *Waterman vs. MacKenzie et al.* Definition of an assignment in patent law is a writing conveying either (1) the old patent covering all rights in the United States, or (2) an undivided share in that right, or (3) the exclusive right in some specific part of the United States. Such instrument vests in the assignee a title in so much of the title itself, with the right to sue infringers alone in first and third cases, and jointly with the assignor in second case. Any other transfer is mere license, conveying no title or right to sue for infringement. A grant by owner of patent of the right to manufacture and sell does not include the right to use the patent if manufactured by third persons, and is therefore a mere license. The record of a mortgage in the Patent Office perfects the title of mortgagee toward all other persons as well as against the mortgagor, and the mortgagee is the only person who can therefore sue for infringement.

One of the most notable cases tried was that of the Edison Electric Light Company *vs.* the United States Electric Light Company (the Westinghouse Company). The opinion was delivered by Judge Wallace. The hearing lasted eight days. The patent in question was No. 223,898, for an incandescent electric lamp. As printed, the testimony fills nearly 6,000 pages. It took the lawyers nearly two years to prepare the case, and the opposing briefs together filled about 1,000 pages. Judge Wallace's opinion made another respectable volume, containing about 10,000 words. It sustains the patent as issued, and orders the decree of injunction against the defendants. The invention was made in 1879, patented in 1880, infringement discovered and suit begun in 1885. The two claims in litigation were—(1) a carbon filament secured to metal wires, as set forth; (2) the combination of carbon filaments with a glass receiver from which the air is exhausted, as set forth. The decision set aside the first claim as not infringed upon, but sustained the second claim as a "highly meritorious discovery and invention, whereby a lamp was made which was practically operative and successful, the embryo of the best lamps now in commercial use, and but for which the subdivision of the electric current by incandescence would still be nothing but the *ignis fatuus* which it was pronounced to be in 1879 by some of the learned experts who are now striving to belittle his (Edison's) achievement and show that it did not rise to the dignity of an invention."

Great Britain.—In January, 1890, the English Court of Queen's Bench, Mr. Justice Day presiding, tried a case that will no doubt be cited as an important precedent. In one of the lower courts, from which the case was appealed, the jury found, upon two issues, substantially that the trade-mark as used by the defendant was in effect an imitation of the plaintiff's trade-mark, and that the defendant had wrongfully or voluntarily disposed of goods that were not really the goods represented by the trade-mark. From that judgment the defendant appealed,

holding that the plaintiff's trade-mark had been improperly registered. The case was complicated by the fact that the deeds were drawn in Spanish and executed in Mexico, so that, while there was no question as to their regularity, much difficulty was experienced in reaching an intelligent conclusion. It was held eventually, however, that the deeds conveyed no good-will, but only an independent right to the use of the trade-mark in question. It followed, therefore, that the registration was irregular and void, and the plaintiff not entitled to maintain an action on which he had recovered judgment. Judgment was accordingly reversed and entered for the defendant, but without costs. In effect, the rule has been laid down that a trade-mark may not go beyond the trade to which it belongs. That this is essential in the interest of the owner of the trade-mark is perfectly obvious, since it is very important that the public should recognize the mark as designating certain special goods, and because it is to the interest of the purchaser to be able, by means of the mark, certainly to identify the article he is purchasing. If the owner of a trade-mark were free to sell his mark while retaining his trade, it is evident that the public would run the risk of being deceived in regard to the goods covered by a well-known mark.

Germany.—In October, 1891, in Germany, an amendment to the law of 1877 went into effect. The principal change that is of interest to Americans is that patents taken out in foreign countries act in anticipation of the invention only after a lapse of three months, thus permitting extended time for application in Germany. If an invention is still in preparation, the real inventor may prevent the issue of the patent. Fees may be paid for the whole time in advance. Fees will be returned if the patent is annulled. Application for annulment can not be made after five years. Fees are not lowered, but may be by the Federal council without special legislation. A patent may be revoked if due diligence is not used to introduce it. Damages for infringement are increased. The new patent office was established in Berlin in April.

Mexico.—A new patent law was passed in Mexico in 1890. Under its provisions any person, native or foreign, may obtain a patent for twenty years, with the privilege of extending it for five years. The office fees are from \$50 to \$150. No official guarantee is given regarding novelty or sufficiency of specifications. Patents are given for articles already patented in foreign countries, but the Mexican patent expires with the expiration of the foreign patent. Supplementary applications for improvements may be filed within one year. The Government may appropriate any patent on payment of a fair indemnity. When application is filed, the patent is published for two months in the "Official Gazette," to allow for interference proceedings, if there is reason for any such. All previous patent laws are repealed.

Swindling Agents.—An easy and profitable method of swindling on the part of unprincipled agents has of late assumed considerable proportions. In the Patent-office "Gazette," published weekly by the department, are hundreds of names of inventors and illustrated accounts of

their inventions. As the addresses of the inventors are given in every case, it is easy for an agent to write, offering to sell or even to purchase an invention. The usual course is to offer to negotiate a sale for some small consideration paid in advance; this payment may be trivial and may be asked for on the ground of necessary expenditure in the matter of postage or of advertisements. The army of inventors is so numerous that small contributions from a large percentage of them may easily afford a considerable income for an adroit swindler. This practice is not confined to the United States, but has been taken up by foreign agents, who find too many victims among Americans.

Patent-office Decisions.—March, 1889, in the case of Donovan, on appeal, Mr. Benson J. Hall, assistant Commissioner of Patents, explained rules 68 and 139 as meaning that each tribunal of the Patent Office is bound to see to it that an inventor shall secure a patent for whatever is patentable in his invention; this is alike the duty of the examiner-in-chief, of the primary examiner, and of the commissioner. Congress has decided that whenever the essential point has been missed in the issue of papers the inventor may claim a reissue on demonstration of the oversight.

January, 1890, a patentee may not say in his claim that certain specific elements of his combination are not essential to the combination or invention.

The Centennial Celebration.—Until the date was nearly at hand it did not, apparently, occur to any one that the hundredth year of the United States patent system ought to be celebrated as an anniversary occasion. It was then too late to organize for a suitable ceremony; therefore it was determined to celebrate instead the beginning of the second century of American patents. The 8th, 9th, and 10th of April were designated early in 1891, and the exercises were held in Lincoln Music Hall, Washington. President Harrison opened the proceedings with a brief address, after which the Rev. Dr. Sunderland asked the divine blessing on the assembly. The regular proceedings were appropriately opened with an address by the Hon. C. E. Mitchell, Commissioner of Patents, on "The Development of the American Patent System." The following named speakers addressed the meetings: The Hon. Carroll D. Wright, Commissioner of Labor, on "The Relation of Invention to Labor"; Justice Blatchford, of the Supreme Court, on "A Century of Patent Law"; the Hon. Robert S. Taylor, on "The Epoch-making Inventions of Americans"; Senator Platt, chairman of the Patent Committee, on "The Invention and Advancement of Science"; Senator John W. Daniel, on "The New South as an Outgrowth of Invention and the American Patent Law"; Ainsworth R. Spofford, the librarian of Congress, on "The Copyright System of the United States." Prof. Thomas Gray, on "The Invention of the Telegraph and Telephone"; Col. F. A. Sealy, principal examiner of the Patent Office, on "The International Production of Industrial Property." Prof. Samuel P. Langley, of the Smithsonian Institution, presided at one day's session, and spoke briefly on "The Progress of Invention." Prof. William B.

Trowbridge, of Columbia College, read a paper on "The Effect of Technical Schools on the Progress of Invention." Prof. Robert H. Thurston, instructor in mechanical engineering in Cornell University, read a paper on "The Invention of the Steam Engine." A paper prepared by Major C. E. Dutton, U. S. A., was read in his absence by Capt. Birney, of the Ordnance Bureau, entitled "The Influence of Invention upon the Implements and Munitions of Modern Warfare." "The Relation of Abstract Scientific Research to Practical Invention," with special reference to chemistry and physics, was treated by Prof. F. W. Clark, of Ohio, chief chemist of the United States Geological Survey. The concluding papers, read on the evening of April 10, Prof. Alexander Graham Bell presiding, were as follows: "The Relation of Invention to the Communication of Intelligence and the Diffusion of Knowledge by Newspaper and Book," by William T. Harris, United States Commissioner of Education. "The Birth of Invention" was considered by Prof. Otis T. Mason, of Virginia, curator of the National Museum, and Dr. John S. Billings, curator of the Army and Medical Museum, concluded with a paper on "The American Inventions and Discoveries in Medicine, Surgery, and Practical Sanitation." In connection with the proceedings at the Music Hall special effort was made to collect in accessible places some of the more notable of the models and machines that have exerted distinguished influence on our commercial progress—the press, for instance, at which Benjamin Franklin worked, a model of the plover used by Prof. Morse in laying the first telegraph line, part of one of the first locomotives built in the United States, and many other interesting relics. Several meetings were held with a view to a permanent organization among inventors and manufacturers of patented articles, the design being to secure co-operation in matters looking to the improvement of the patent system, or, to use the words of the prospectus, "that organized effort may be made to remedy existing defects and provide against danger in the future." The organization took shape in the election of Dr. Gattling, inventor of the Gattling gun, as president, and Gardner R. Hubbard, of Washington, Prof. William A. Antony, of the Electrical Engineers, Thomas Shaw, of Philadelphia, and Benjamin Butterworth, of Ohio, as vice-presidents.

Inventions in 1890-'91.—During these two years 46,454 patents and registrations have been issued in the United States. Only a very small portion of them can be here enumerated. In the following list, it is intended mainly to include only the more homely and convenient devices that are adapted to the uses of every-day life. Some of these inventions are quite unknown to the general public, and few of them have attained more than a local reputation.

Boats.—An ingenious folding boat has been placed in the market by its inventor, Charles W. King, of Kalamazoo, Mich. The objection to almost all folding boats is that the spaces between the ribs and the longitudinal pieces are so wide that when placed in the water and loaded the external pressure is such as to destroy the lines or model of the boat. In Mr. King's invention (Fig. 1) he has employed galvanized

FIG. 1.—KING'S FOLDING BOAT.

steel wire for the necessary "timbers"; the formation of the boat, as shown in the illustration, consisting of four sections of such wire lashed together, overlapping one another in such fashion as to cover almost the whole interior surface of the boat. The necessary longitudinal stiffness of the boat is secured by a stout, oaken keel, hinged amidships and furnished with stem and stern pieces that fit into the curved ends of the flexible, waterproof covering. The curved stem and stern pieces are set in place while the keel is still bent upward in the middle at its pivotal point. It is obvious that the downward pressure on the middle of the keel thrusts its ends

they are permanently held. These ribs also hold down the smaller wire frame-work already in place, pressing it so firmly against the flexible covering that it can not be moved unless the keel is detached. Along the midship section of both gunwales two removable strips of wood are placed, and these are pressed outward by an adjustable cross piece, which can be lengthened or shortened at will, thus increasing or decreasing the beam of the boat according to convenience or necessity. Immediately on the steel ribs before mentioned are laid light floor boards, running fore and aft in sections, so that the occupants of the boat sit or stand without danger of stepping

upon the flexible covering. These, too, are securely locked in position by simple devices. With each boat is a light canvas cover, in which all the parts can be packed, and finally the whole is wrapped up in an external case formed by the floor boards. The total weight of such a boat, of medium size, capable of carrying three men in smooth water, and about 12½ feet long, is 64 pounds.

Propeller for Small Boats.—The ingenuity of inventors has for a long time been directed to devising some kind of mechanical appliance that should supersede the oars and paddles. Ordinary paddle wheels and screw

propellers, when applied to small boats and driven by arm or leg power, are not nearly so efficient in proportion as when driven by the tireless steam engine. A recent device for this purpose is known as the "feather-blade elliptic propeller" (Fig. 2). It is a mechanical device for operating a paddle that closely approximates

FIG. 2.—ELLIPTIC PROPELLER.

outward, so that the entire flexible covering is strained longitudinally as tight as possible. The keel being once in position, ribs made of somewhat heavier steel wire and numbered to indicate their proper position in the boat, are slipped into sockets along the gunwale, and then pushed along the keel until they engage notches, where

the movement of a single-bladed paddle when used by hand. Reference to the illustration will render the principle apparent. The longest movement of the paddle is when immersed, the blade being nearly vertical in the water, so that there is no splash or slip or loss of propulsive effect. It has the advantage over oars in that the boatman faces the bow. The propulsive machinery consists of a simple arrangement of pedals and cranks. The steering gear is operated by hand, tiller lines leading to an ordinary rudder attached to the stern-post. It is claimed by the inventor, George V. Tibbels, that there is a gain of 25 per cent. over any other means of water propulsion for small boats. The machinery can be made of wood or metal, is preferably operated by hand or foot, but any of the petroleum, steam, or naphtha engines can be adapted to it.

FIG. 3.—CAN-OPENER.

Can-Opener.—Among the scores of devices for opening tin cans, the invention of Hasbrouck Alliger, of Rondout, N. Y., seems to combine almost all the excellences of such devices. It is made in two parts, as shown in the illustration. The longer or central piece is provided with a bent point, which can easily be forced by the hand through the top of the can; then, bending it downward till it rests horizontally against the

FIG. 4.—CLOTHES-LINE PROP.

top of the can, the smaller part bearing the knife blade is forced through the edge of the tin; both parts are then doubled together, the blade assuming an efficient cutting angle, and it is a very easy matter to pass the blade around the entire can, separating the top neatly from the sides.

Clothes-line Prop.—Any one who has witnessed the trouble encountered by a laundress in placing the ordinary poles used for the support of clothes lines will appreciate the tightening and retaining device shown herewith (Fig. 4). The top of the pole is provided with a cross piece and furnished with hooks curved inward on the cross piece and downward on the main pole. In the illustration, 1 shows the method of engaging the clothes line, 2 shows the second motion in tightening the line, and 3 shows the pole when set upright, the line engaging all three of the hooks.

An Elastic Chain.—Many devices, such as springs and buffers of India-rubber, have been invented to overcome the longitudinal rigidity of an ordinary chain, but a device that makes the chain itself elastic possesses obvious advantages. Fig. 5 shows an invention patented by Charles Redwood, of Denison City, Texas. It is made with flexible wire loops, each piece of bent wire having an eye at each end. These eyes are made of such shape and size that the eye of another similar piece of wire can be passed through, and thus a chain of any length can be constructed. The middle portion of each piece of wire is bent at a somewhat curved angle, so that when a strain is brought upon the chain the eyes of each link slip together toward the angle, and if the strain is continued and increased the curved pieces of wire act as springs and recover their normal position as soon as released. No. 1 shows the chain at rest; No. 2, subjected to a strain.

FIG. 5.—ELASTIC CHAIN.

A New Foot-bath.—For the feeble or infirm, any device that renders easier the needful but difficult operation of thoroughly cleaning the feet is to be welcomed. The invention of Mrs. M. L. W. Martinot, of New York city, seems to approach perfection for this purpose. The illustration (Fig. 6) shows the principle. A strong, flexible, water-tight stocking is made large enough to permit perfectly easy putting on and taking off. The inner surface is studded with soft, elastic rubber protuberances, which press against the skin with every movement of the foot and ankle. A comparatively small quantity of water or other me-

FIG. 6.—FOOT-BATH.

dium, warmed and prepared to suit the case, is poured into the stockings, which are then put on and properly secured about the legs. The wearer may then effect a very thorough foot-bath by walking about the room, or otherwise producing the required friction. For travelers or others whose supply of hot water is apt to be limited, this device would seem to be very convenient.

A Bath Lift.—Few of the ordinary operations of hospital practice are more difficult than that of placing a helpless patient in a bath-tub, an operation very often desirable for the sake of

FIG. 7.—BATH-LIFT.

prolonged immersion. Fig. 7 shows a lift invented by S. A. K. Strahan, M. D., of England. It is a light but strong metallic frame fitted with ordinary twine netting upon which the patient can stretch himself, or can be laid with comparative

ease, and then, by means of the crank, be lowered into the bath. One attendant can thus bathe a patient who can with difficulty be handled by four under ordinary conditions. When the bath is over, the patient is easily hoisted out of the water, rubbed dry, and prepared for bed. Such an appliance could readily be fitted to a bath-tub in a private house.

Operating-table for Veterinary Surgery.—One of the problems that confront the veterinary surgeon is the difficulty of retaining his subject in an accessible position during an operation. The ordinary method of tricing up a horse or an ox by means of wide abdominal support is open to objections, since the animal, when becoming frightened, can struggle and render it almost impossible to secure him properly. Dr. L. A. Anderson, of Cincinnati, has in use a table and appliances at his hospital on which a heavy animal of any kind can be secured and treated without difficulty or danger. The animal is led alongside an object which he might easily mistake for a fence or the side of a barn; here he is harnessed, in a somewhat novel method to be sure, but in a way not calculated to arouse his suspicions. Several strong, broad bands are passed around the body, and a similar one loosely about the neck, the animal still standing in a natural and unrestrained position. This done, the operator goes to the other side of the table and operates a crank, gently tilting the supposed fence or barn door first to a slight angle and finally to a horizontal position; and the animal may struggle as he will until he finds that such efforts are futile; usually the patient subsides as soon as he finds himself approaching a horizontal position.

Rein Grip.—Fig. 8 shows a simple device that will be of interest to every one who has much driving to do. There are already in use many devices to facilitate the firm grip upon the reins, but most of these require some complicated operation before they can be moved back and forward according to the necessities of the case. Elvin L. Smith, of Mansfield, Mass.,

is the inventor. It consists of two similarly shaped cam blocks of a curved or horn-like shape, held together and pivoted upon two simple curved plates, between which the rein passes. The plates are spaced apart by parallel rods, which serve as pivots upon which the cam blocks are hinged. Each rod is surrounded by a spiral spring, one end of each spring being fast to the flange of the bracket plate, and the other end fixed in the cam block. The two springs operate in such a way that their strength is exerted to extend the blocks oppositely, causing the bases of the cams to press on both sides of the rein passing between them. When it is in use the fingers naturally press upon the lateral wings, forcing the butts of the cams together firmly upon the rein, but, by a very slight press-

FIG. 8.—REIN GRIP.

ure exerted without changing the hand, the free ends of the blocks may be folded into the position shown above, when the rein is released from the grip and the whole appliance may be moved freely forward or back. The grip may be made to embrace two lines as well as one.

Luminous Keyhole Escutcheon.—It is surprising that the use of luminous paint for many purposes has not become more general. One of the most common instances where it can be made useful is perhaps on the doors of closets, chests, etc., kept in dark places. John E. Fitch, of Albuquerque, N. M., appears for some reason to have been the first to perceive the advantage of a luminous keyhole escutcheon. The merits of such an invention are so clear that it need not be here illustrated. The device has a concave or recessed back, coated with phosphorescent paint and covered with glass; surrounding the phosphorescent paint is a frame completing the escutcheon and making it ornamental. It is well-known that phosphorescent paint when kept for a long time without an opportunity to renew its luminosity by exposure to the sun loses its normal power of emitting light in the dark. Good paint shows readily in the dark for two or three years, and its renewal at the end of that time is by no means difficult.

Railway Appliances.—One of the great difficulties encountered by railroad men in grazing countries where fences are scarce and cattle abundant arises from the propensity of animals to stray out of the highways or out of their proper pastures and wander along the railroad track. Every one who has traveled much on such lines has witnessed the stolidity with which a herd of cows, or a single animal even, will watch the approach of a shrieking locomotive and stand placidly in front of it, chewing her cud or resolutely refusing to get out of the way. W. J. Burk, of Seattle, Wash., has devised a steam jet connected with the engine, so arranged that by very simple mechanism an engineer can send a stream of hot water to a considerable distance in front of the cow-catcher of his locomotive; such a discharge would, of course, effectively frighten any number of cattle without seriously injuring them.

Another device is intended to render it impossible for cattle to pass any barrier, such as a fence or a ditch, by following the track. The ordinary plans, unless elaborate and expensive, have proved ineffectual, the stupid cattle ex-

tacle for soap, scrubbing-brush, cloth, etc. The device is a circular shelf, with slotted projections fitting over the edge of the pail, and extending downward sufficiently to insure a secure hold.

Curtain Rings.—The very general introduction of curtains and *portieres* in household

FIG. 10.—CURTAIN RINGS.

decoration has suggested to N. B. Allen, of New York, the application of a device for curtains that has long been in use among seamen, namely, rings to which small rollers are fitted, so that in moving the curtain the rings will not bind in passing along the rod. This device is shown in Fig. 10. Similar devices, already referred to as in use among the seamen, are called "pearls." A shows the rings in use, fitted with the attachment, and B the ring separate from curtain and rod. The attachment is of thin sheet metal, fitted to the shape of the inner surface of the ring, to which it can readily be attached by slightly springing the metal. In place of the ordinary pearls are fitted small antifriction rollers, the bearing surfaces of which rest upon the face of the rod upon which the curtain hangs.

Cooking Utensil.

Many devices are in use to facilitate the heating of water and the like over ordinary gas fixtures. An improvement in this direction has been patented by Whitfield Ward, of New York. A circular opening is cut in the bottom of an ordinary stew-pan, and to this is soldered a conical

hood, rising within the pan. Within this hood is a perforated cylinder, which is held in position by a perforated ring flush with the bottom of the stew-pan. The illustration (Fig. 11) shows the utensil in section. When it is placed upon the gas fixture the burner rests within the perforated hood, and the utensil is thus held securely. The gas being turned on and lighted, burns only when it comes in contact with the air below the perforated hood.

FIG. 11.

hibiting a highly creditable degree of ingenuity in overcoming barriers that would seem to be effectual. In this device (Fig. 9) a series of bars of thin iron or steel are placed upon their edges parallel with the rails; they are notched into cross pieces so as to prevent displacement, and in order to avoid possible injury they are spaced so closely that no animal can get its feet caught between them; moreover, they are made of unequal height, so that a secure footing is impossible for any hoofed animal. It is claimed that no animal can be induced or forced to trust itself to the treacherous support offered by this guard, one great advantage of which is that it requires no costly excavation beneath the sleepers.

Attachment for a Pail.—Every one must have noticed the difficulty that the housemaid experiences in carrying her scrubbing-brush, pail, and soap from one place to another. William P. A. Scott, of Pennsylvania, has patented a simple attachment that can be placed upon the edge of an ordinary pail and used as a recep-

Yeast Cake.—Joshua Barnes, of New York, has secured a patent for what is termed a "sugar-coated yeast cake." The term must be regarded as technical, since the coating is not distinctively composed of sugar, but of some impermeable gum. The invention is valuable in that it preserves for an indefinite period the domestic or dry yeast cake, which ordinarily can be kept in a serviceable condition only a few weeks at most, and only a few days where the conditions are

FIG. 9.—CATTLE GUARD.

unfavorable. The sugar coating or gumming process, it is claimed, is a safeguard against the effects of the atmosphere and of insects.

Spoon-holder.—One of the most common mishaps of the sick-room is to mislay the spoon

FIG. 12.—SPOON-HOLDER.

that belongs with a particular bottle. A recently patented contrivance is made of wire, easily adjustable about the neck of any bottle. It has at one end a double curve so adjusted as that it will hold a spoon securely in the most convenient position for use. This is shown in Fig. 12.

Automatic Screw-driver.—This device is intended to facilitate the driving of screws and similar operations in carpentry. In external appearance it is like an ordinary screw-driver, but within the handle is a spiral shafting arranged on the principle of what is known to mechanics as longitudinal reciprocation. The screw is started as usual, the point being sunk in the wood. To drive it home, it is only necessary to bear heavily and vigorously in the direction of its length. The screw is immediately revolved with great velocity and driven rapidly home.

FIG. 13.—SCREW-DRIVER.

This device is patented by Christopher S. Olsen, of Illinois (see Fig. 13).

Book-protector.—The spacing of shelves in a library, out of consideration for the wear and tear of books, should be such that the books can be removed without sliding them upon the lower shelf, but this involves a large space between the tops of the books and the upper shelf, which is unsightly, and is not desired by most librarians. Lawrence C. Leith, of Texas, has patented a carriage

FIG. 14.—BOOK-PROTECTOR.

made of a size corresponding with the book it is designed to hold (see Fig. 14). It has a raised central portion to support the lower edges of the leaves, and the corresponding edges of the covers rest on the outer portion of the carriage. Inserted in the under side of the carriage are

transverse rollers. The platform is run in or out on the shelf, there being a pull on the front

edge of the carriage on which the name or number of the book may be marked for greater ease of reference. This device is of course mainly useful in the case of large and heavy books, whose lower cover edges rapidly become worn out where they are frequently used.

Indexes.—Every book should have an index, and almost all modern books have indexes; but there are many works in constant use that lack these important accessories. Among recent patents is an attachment to an ordinary book cover, so arranged that it holds leaves for indexing, but forms a part of the cover, folding within at the end of the volume. If this device could be attached to all the books that need the addition of an index, work in reference libraries would be greatly facilitated.

Book-holder.—A simple device for keeping open the pages of an unruly or ill-bound book

FIG. 15.—BOOK-HOLDER.

has been patented by William H. Ash, of New York. The contrivance is clearly shown in Fig. 15. It is made of wire, and composed of two similar parts having a sliding connection with each other, each of the said parts being bent into a hook at the outer end and large enough to fit over the edges of an ordinary book. The other or inner end is bent at a sharp angle, so that it engages the part of the other hook with which it is in contact.

Calf-feeder.—One of the most tedious and exasperating experiences of a stock breeder is to teach a young calf to drink from a pail or trough. William E. Spinners, of Iowa, has patented a device intended to help the farmer in solving this

problem. It consists of a flexible tube several inches in length, which is attached to a perforated plate, which in turn may be screwed to the bottom of a pail. The perforated plate freely admits milk to the interior of the tube, and the calf, in endeavoring to drink, gets hold of the upper end of the tube, and thus learns to help himself without the usual tedious devices to which farmers resort (see Fig. 16).

FIG. 16.

Rope-clamp.—Various devices are in use for the adjustment of tent ropes, clothes lines, tennis nets, and other fixtures, where it is necessary to lengthen or shorten a rope at will. The ordinary wooden fiddle in use for this purpose has its disadvantages. S. W. Conklin, of New York,

has devised an improved clamp, which apparently is very convenient. The frame or case is made of malleable cast iron, at one end of which is a

FIG. 17.

clamping lever of the usual type, formed with an eccentric notched upon its lower surface to engage the rope. This lever has an inclined slot for its pivotal pin, so that it seizes the rope, forces the lever forward, and causes it to bear outwardly upon

the rope, thus increasing its holding force. At the opposite end of the frame are two rigid rings, through which the rope passes, and can be attached wherever required (see Fig. 17).
Ensilage.—Processes for the preparation of ensilage are numerous, and are probably more familiar to agriculturists in European countries than in America. But the building of silos, either below ground or above, is not uncommon in this country. Cuthbert G. Johnson, an Englishman, has patented in this country a process for the preparation of ensilage, which is claimed to be highly efficient, though, so far as known, it has not been tested in this climate. The device consists in placing the material in a stack above

FIG. 18.

ground. Near the circumference at the foot of the stack, and attached to the solid platform, are fixed blocks on pulleys. Through these, and over the top of the stack, ropes are passed, and the ordinary appliances of mechanics can be used to produce any desired amount of compression upon the stack. Fig. 18 shows a section of the stack, with the pulleys in position. The free ends of the rope pass to cleats or to other blocks, which, with the ordinary combinations, may be used to increase the pressure. The idea of the invention seems to be to avoid the expense of digging deep pits, usually employed, or the expensive structures that are sometimes erected above ground.

Storm Apron.—Any one who has ridden far in a carriage during a driving storm will appreciate the device recently patented by Dr. P. J. Gibbons and David B. Shelley, of Pennsylvania (Fig. 19). The ordinary carriage boot, it will be remembered, is rolled up and stowed on the inner side

of the dash-board. The present device is an apron of rubber, oil-cloth, or other waterproof material, so cut as to fit over and outside the dash-board. It has side flaps, which completely protect the floor of the carriage or buggy, with elastic strips to hold them in position, held fast to the side of the seat, and leather straps to raise it, so as to protect the person of the driver. The old-fashioned boot allowed the water to drain down, and almost inevitably to find its way into the bottom of the vehicle; the present device causes it all to flow outside and fall to the earth.

FIG. 19.

Swinging Ships' Berths.—The wretchedness that results from sea-sickness and the increasing number of ocean travelers have set inventors to work to alleviate their discomfort. Several inventions of the kind were shown at the recent Marine Exhibition in Boston. These differed from one another simply in detail. Some of the favorite ocean liners, as the "City of Berlin," "Chicago," "Chester," and "City of Richmond," and some of the ships of the North German Lloyd Company have used these devices with satisfactory results. The berths can be placed in an ordinary state-room; some of them scarcely occupy more space than is taken by the fixed berth. Great ingenuity has been exercised in securing sufficient swing by reciprocating motion, so that the actual space of the state-room will not be largely diminished. Some of the berths will respond readily to a roll of over 50°, while in point of fact a vessel in the roughest sea rarely rolls more than 40° or 45°. So nice are the adjustments in the 24-inch berth that it requires, it is said, only 26½ inches for its full operation. This is highly important when it is remembered that saloon cabins do not average more than 6 feet 2 inches in length, and 27 to 29 inches behind the doors. One of the berths is in appearance almost like a piece of movable household furniture, and scarcely more bulky than a sideboard or an upright piano. Most of these berths are hung so as to swing on pivots at the head and foot; but others are suspended from above by a central point of support, so that the pitch, as well as the roll of the vessel, is sensibly modified. Great ingenuity has been displayed in the adaptation of spare corners and nooks of the berths to hold toilet articles, books, and the other little necessities of which every traveler has a troublesome store. In the case of the free-swinging berths, rubber packing and springs are necessary to take part of the strain, and practical tests have shown that a glass of water, nearly full, can safely be left for hours in a berth, even when a vessel is passing through a tempestuous sea. Most of these inventions have been tested, and may now be said to have passed the experimental stage.

Line Guide for Fishing Rods.—The little metal rings that are commonly used on fishing rods to guide the line from the reel to the tip are ordinarily of somewhat elaborate construction and corresponding expense. Joel C. Parker, of Michigan, has invented and patented a very

FIG. 20.

simple appliance of this kind, consisting of two or more spiral coils of wire, the uncoiled ends of the wire projecting so as to be readily lashed to the rod. When in position the axis of the coils is parallel with the rod, and the line runs freely through it in the usual way (see Fig. 20).

Drag Anchor.—Emil J. Pagan, of France, has patented what would seem to be a highly efficient drag anchor, designed to take the place of the make-shift devices usually employed by mariners to keep the head of the vessel to the sea in a heavy gale. The invention, as shown in Fig. 21, consists of a series of umbrella parachutes, attached to the cable, and weighted at suitable intervals with sinkers to keep them below the surface of the water. As seen at the left of the illustration, the anchor is in the act of being hauled back on board the vessel. The tripping-line is allowed to hang slack when the anchor is in use, but as soon as it is hauled

FIG. 21.

inboard the pressure is brought upon the reverse side of the umbrella parachutes, and they automatically close in passing through the water. An anchor of this kind can be stowed in very small space when not in use, and is always ready to be thrown overboard, and will act instantly and efficiently. In the case of most of the drag anchors in use, delay is almost always necessary in locking and adjusting the supports required to keep them in position.

Photographic Camera.—Among the most interesting of the photographic appliances of the year is the camera patented by Carl C. Stirn, of New York. It may be described as a panoramic camera, intended to produce such pictures as are used for the outlines of the cycloramas that have been exhibited in the principal cities of the United States. In order to secure an accurate panoramic photograph, it is necessary to revolve the camera on a pivot coincident with the cen-

ter of the lens, not with that of the camera itself, and upon this principle rests one of the most important claims of this patent. In connection with this, however, are film rollers, by which the ordinary sensitized film is kept taut, and the surface to be exposed is constantly maintained exactly at the required focal distance; moreover, the distance of the revolution is regulated by means of ingenious machinery, so that when one picture has been taken the film is shifted, and the edge of the next exposure coincides exactly with the edge of the preceding exposure. By this means a perfect photographic circle may be made of the entire horizon, and all the perspective values and the different conditions of light and shade may be secured with great rapidity and exactness.

Geographical Device.—Dr. Edward Eggleston, of New York, has patented, and shows in practical use in connection with a "First Book in American History," a device that is well calculated to impress geographical divisions on the mind of a child. In brief, the invention consists of the combination in book form of a series of maps, each printed upon one side of a leaf of the book, and each representing a separate portion of a given country. The leaves bearing the maps are successive; for instance, the first recognized boundaries of the United

States may be shown upon the first leaf; the blank space of this leaf is cut away with a pair of scissors. When the printed part which remains is folded down on the succeeding page, it exactly fits upon the next territorial acquisition of the United States; and thus, by cutting away the blank portion of the successive leaves, the whole present territory of the United States is built up in its regular order, and at length the complete map is seen at a glance as the country exists at present. Apparently, this device will effectually impress

upon the youthful mind any geographical changes that may take place.

Lovibond's Tintometer.—This device is intended to reduce to a certain definite and fixed standard the various color tests in use among dyers, print manufacturers, metallurgists, brewers, oil refiners, and, in short, all the trades that depend upon color for any stage or process of manufacture. Hitherto varying conditions of light and, to a very great extent, the "personal equation" have rendered such tests more or less untrustworthy. The tintometer, the invention of Mr. Joseph W. Lovibond, of Salisbury, England, may be briefly described as consisting in effect of two tubes placed side by side, provided with an eye-piece at one end, and open at the other end. Slight changes in the mechanical arrangement provide for the examination of opaque, transparent, solid, or liquid bodies (see Fig. 22). At the left, marked *D*, is a re-

flector, adjustable so as to show an even white surface in the direction of the tintometer at the right. This last is divided longitudinally, so that an observer at *E* will see through the tubes two equal white spaces on *D*. Supposing a liquid to be under examination, it is placed in a gauged vessel fitting a compartment in the left-

FIG. 22.

hand tube. Then slips of tinted glass are placed in the right-hand tube until the color of the liquid is exactly matched. In the case of solids or textile fabrics, the process is the same except that the object is so placed that reflected light instead of transmitted light reaches the eye of the observer at *E*. Here, then, is a system by which colors can be absolutely compared under constant conditions that render possible the adoption of a standard unit of color in scores of industries now more or less uncertain. The inventor has devised a very simple scheme of estimating color by a standard scale, each outfit including a large number of tinted-glass slips properly marked to correspond with a registered scale. Thus if a fluid in a one-inch vessel matches a glass slip marked 520 it contains 8 degrees of series number 500. The system includes the use of several slips in case of need, and the combinations of yellow and blue, making green, or of red and blue, making purple, are readily gauged and registered. The tintometer is not very generally known in this country, but is apparently entitled to the consideration of many different branches of very large manufacturing interests.

Flexible Metallic Tubes.—Many attempts have been made in the direction of flexible tubes, and with more or less success. But the most promising device as yet produced is of English origin. The plan of construction is seen in Fig. 23. A thin strip of copper, brass,

FIG. 23.

or gun metal is bent so that its section resembles the letter *S*. This is coiled upon itself so that the parts interlock continuously, forming a tube with overlapping and interlocking joints, which have of necessity considerable play upon one

another. The re-entrant curves of the section vary with the amount of flexibility required, tight joints being less flexible than those that have more play. To secure tightness a "thread" of fine rubber is fed into the interspace of the joints while the tube is in process of manufacture, and this is said to render it quite tight for gases and liquids under slight pressure and for steam and water under very heavy pressure especially. The liquid under pressure has the effect of tightening the joints. The tube weighs about the same as does India-rubber tubing of the same strength, and will, no doubt, endure rough usage better. The degree of flexibility may be judged by a half-inch tube which will coil around a circle of five inches diameter.

Rotary Snow-Plows.—Since their invention a few years ago, these plows or excavators (for they are not properly plows) have undergone many improvements. The latest model, known as the Jull centrifugal snow excavator, has recently achieved such a notable success in breaking a snow blockade on the Union Pacific Railway as to merit especial notice. The first of these machines was tried on the Rome, Watertown,

FIG. 24.

and Ogdensburg Railway on March 6, 1889. For 750 feet the track was covered with frozen snow to a depth of from 2 to 7 feet. The excavator went through it without a halt. After other tests the Union Pacific Railroad bought the machine and sent it to Kansas, where it broke the most formidable snow blockade that has recently occurred in the mountains. The machine (see Fig. 24) is 50 feet long without its tender, which is similar to that of an ordinary locomotive. In front of the structure is the rotating screw with its point quite near the ground at one side. This screw is like an immense cone-shaped augur presenting cutting edges of steel with curved helix-like wings, that hurl the snow backward and to one side. Suppose this huge bulk to be moving forward at a speed of about 8 miles an hour, with the excavator, driven by 800 horse-power turning at the rate of 300 revolutions a minute. It would seem

that snow in almost any form short of solid ice must yield before such a powerful engine. In point of fact, this plow accomplished work that had defied all the energies of the railroad. The cone weighs about 6 tons, and clears a track 11

feet wide. The plow is pushed by 1 or more locomotive engines, according to the depth of snow. It cleared the track between Baker City and La Grande, a distance of about 80 miles in two days, removing a mass of snow that might otherwise have impeded travel until the opening of spring. It is announced that the machine that has rendered such good service is to be tested in removing drifted sand from the tracks of the Union Pacific during the summer. If successful, there seems to be no reason why the same principle should not be effective in dredging silt or mud in some of the great engineering works now in progress.

Ships' Windlasses.—Many improvements have been made in recent years in the mechanical appliances used for hoisting heavy weights on shipboard, especially anchors and the like. The old-fashioned wooden capstan with its direct-acting attachments is now seen only on the antiquated craft of a former generation. The modern capstan is of iron and steel throughout, with mechanical connections that largely increase its efficiency and enable an instant change if desired from a high power and slow speed to high speed and diminished power. Such adjustments are especially desirable in the case of steam-ships. When the anchor holds firmly a tremendous force can be applied until the grip is broken; then, by simply moving a lever, the speed can be largely increased, and the anchor hoisted to the davits while the ship gets under way. Steam connections are now usual between

should steam give out; hence a compact and scientifically constructed reproduction of the old wooden capstan is often found on deck, especially in large vessels. On smaller vessels and yachts, windlasses are generally used and operated by

FIG. 26.

what are termed pump brakes or by levers working on the ratchet principle. In Fig. 25 the Providence capstan windlass is shown as one of the most perfect machines of its class. It is used on the new United States men-of-war and on a large number of first-class American vessels. This, it is claimed, is the only windlass made with a single-headed capstan capable of doing

double duty. The engraving shows the general arrangement of shafts and bearings, but some of the recent improvements can not be shown in a single perspective drawing. The capstan shaft, for instance, steps upon a center bearing for the windlass shaft which extends downward and is bolted to the deck. It is also re-enforced by a solid casting bolted to the pawl-bitts. These double supports render it almost impossible for the windlass shaft to spring or break. The wheels upon which the chain cables rest are called "wild-cats," because they can be disengaged and allowed to turn freely upon the windlass shaft. They are formed so that the links lock themselves between converging flanges, and the cable can not slip so long as it rests in the angle. The wild-cats are readily locked to the shaft or unlocked by means of a lever inserted in the

FIG. 25.

the donkey engine and the windlass, and the once tedious operation of weighing anchor is reduced to an affair of a few minutes, steam doing all the hard work. It is important, however, that the machinery be manageable by hand power

square holes. The detachable lever operates a steel friction band that passes around a drum connected with the wild-cat, and is firmly bolted to the deck (Fig. 26). This locking and friction arrangement is duplicated at the other side of

the windlass. Outside the end bearings of the windlass are the usual drums for operating hawsers or other lines in heavy hauling or hoisting. When steam is used to operate the windlass the connection is made through an endless screw operating on the large cog wheel, which is in that case shaped differently to accommodate the changed conditions. It is sometimes desirable to operate the friction band from the lower deck, and in that case the lever is placed as in Fig. 26, which shows the ingenious method whereby the wheel is clasped on all sides by the friction band. *A* is the lever, *B* an eccentric bearing, *C* the friction band. When the lever is depressed in the direction of the arrow it is evident that the lower part of the band is powerfully drawn toward *B*, and any desired pressure exerted upon about three quarters of the periphery of the wheel.

Binocular Vision in Great Telescopes.

The production of the telescope represented by the accompanying drawings was suggested by the fact that Nature created men with two eyes, but none with one; and as the Creator never makes a mistake nor wastes his energies in making two things where one is sufficient, it was logical to suppose that two eyes are better than one for the purposes of vision, and that when we peep into the telescope with one eye shut we are only using half the means that Nature has placed at our disposal in endeavoring to solve the visual problems of the universe. The doctrine has been persistently set forth that any attempt to adjust two great telescopes into the conditions of binocular vision must of necessity result in failure, as two such instruments would always show the same object double; but the double telescope here represented showed, when completed, only a single image of any object at which it was directed; and when it is properly adjusted to the eyes of the observer, two images of the same object can not be seen, but the image is better defined and more than twice as bright as that in either telescope when viewed with a single eye, for the reason that the loss of one eye makes us more than half blind. Fig. 27 is a longitudinal section through the center of the instrument, showing the convergence of the light of a star that enters it. In the instrument *A*, *L* is the object glass, and the dotted lines *C, C*, represent the light being gathered to the focus *F*, by which it may be seen that it is only the ordinary form of telescope. Its companion, *B*, is so placed as to be perfectly parallel with *A*, and they are secured together by the couplings *D, E*. The object glass in this instrument is within the tube, but farther back than that of its companion. The focal length of the two object glasses being the same, it is necessary to place it far enough back in the telescope to compensate for the length of the cross adjustment, *G*, at the final focus, the nature of which will be understood by following the dotted lines that converge from the object glass, *O*, to the focus. A prism or speculum at *H* reflects this converging light transversely to its original direction, as shown at *I*; it is then intercepted at *J* by another prism or speculum and reflected to the final focus of that telescope at *K*. The cross adjustment *G* is constructed so as to slide, in order that the two eye-pieces *F* and *K* may be adjusted to the different distances between the

eyes of different observers. In this telescope, *B*, there is also an additional rack and pinion, *P*, for moving the object glass, *O*, a little back or forward, so that the eye-pieces, *F* and *K*, may be coincident in position. The eye-piece *K* has the direction of the dotted line *M*, which converges to the point *N*, on the optical axis of *A*, sufficiently distant from the observers to give the eyes an

easy angle of visual convergence. At this point the images of both telescopes coalesce, and thereby present to the observer only a single image of a single object, and instead of seeing two images of the same object it is simply impossible to divide the single binocular image into two unless by pressing the ball of one eye out of its natural position. When it is necessary to use this instrument for two observers at the same time, or by mas-

FIG. 27.

FIG. 28.

ter and pupil, the cross adjustment, *G*, is removed, and then the eye-piece end takes the form shown by Fig. 28. Thus the instrument is practically two telescopes, which will always have the image of the same object in their respective foci, thereby furnishing the master with the means of describing to the pupil.

One of the advantages of constructing great telescopes for binocular vision is to be found in the fact that the intensity of light brought to the focus by two object glasses of thirty inches in diameter would be greater than that brought by a forty-inch objective to its focus. As their relative focal lengths would be proportioned to the diameter of their object glasses, the observatory for the shorter instrument would be much smaller and less costly than that of the forty-inch instrument, but the double telescope would have much the greater space-penetrating power. As that quality is proportionate to and dependent upon the relative brilliancy of the image at the focus, the space-penetrating powers of the double instrument would be superior to that of the greater in the proportion of sixteen to

nine. This double telescope is the invention of Charles B. Boyle, of New York.

PENNSYLVANIA, a Middle State, one of the original thirteen, ratified the Constitution Dec. 12, 1787; area, 45,215 square miles; population, according to the census of 1890, 5,258,014. Capital, Harrisburg.

Government.—The following were the State officers during the year: Governor, Robert E. Pattison, Democrat; Lieutenant-Governor, Louis A. Watres, Republican; Secretary of the Commonwealth, William F. Harritt, Democrat; Treasurer, Henry K. Boyer; Auditor-General, Thomas McCamant; Secretary of Internal Affairs, Thomas J. Stewart, Republican; Superintendent of Public Instruction, D. J. Waller, Jr.; Secretary of Agriculture, Thomas J. Edge, Republican; Adjutant-General, William McClelland, Democrat; Attorney-General, W. U. Hensel, Democrat; Insurance Commissioner, J. M. Forster to May 25, and afterward G. B. Luper; Chief Justice of the Supreme Court, Edward M. Paxson; Associate Justices, James P. Sterrett, Henry Green, Silas M. Clark, Henry W. Williams, James T. Mitchell, and J. B. McCollum.

Finances.—The following was the report, Nov. 30, 1891: The balance in the State Treasury Nov. 30, 1890, was \$4,426,645.45; the total receipts during the year were \$13,007,161.74. This revenue was derived from the following sources: Lands, purchase money, and interest, \$1,948.27; fees for warrants and patents, \$994.08; tax on corporation stock and limited partnerships, \$2,378,911.54; tax on gross receipts (corporations), \$696,176.62; tax on gross receipts (notaries public), \$4,402.21; tax on gross premiums, \$55,040.68; tax on bank stock, \$413,177.45; tax on net earnings or income, \$68,405.44; tax on loans, county and municipal, \$122,800.20; tax on loans of private corporations, \$1,289,220.41; tax on personal property, \$1,906,244.67; tax on writs, wills, deeds, etc., \$172,443.82; tax on collateral inheritances, \$1,232,766.80; tax on sale of fertilizers, \$8,710; foreign insurance companies, \$395,307.97; eating-house licenses, \$11,339.99; retail liquor licenses, \$440,249.18; wholesale liquor licenses, \$422,479.77; brewers' licenses, \$144,801.39; bottlers' licenses, \$94,196.62; retailers' licenses, \$552,981.83; billiard licenses, \$45,296.24; brokers' licenses, \$41,224.46; auctioneers' and peddlers' licenses, \$28,799.62; theatre, circus, etc., licenses, \$29,832.25; pamphlet laws, \$530.45; bonus on charters, \$243,831.87; accrued interest, \$14,531.87; penalties, \$121.95; notaries public commissions, \$20,200; Allegheny Valley Railroad Company, \$192,500; United States Government, \$1,825,886.44; annuity for right of way, \$10,000; escheats, \$1,895.13; fees of public officers, \$92,541.10; refunded cash, \$7,759.76; conscience money, \$215; miscellaneous, \$21,204.66.

The expenditures include the following items: Expenses of State officials and departments, \$2,006,717.95; loans redeemed, \$2,538,352; interest on loans, \$535,553.25; premiums on loans redeemed, \$58,591.59; charitable institutions, \$627,072.85; care and treatment of the indigent insane, \$509,282; penitentiaries, \$95,140; State Industrial Reformatory, \$92,943.50; Reform School, \$60,409.18; House of Refuge, \$65,000; agriculture, \$2,730; second geological survey,

\$5,000; State tax on personal property returned to counties, \$436,558.53; Soldiers' and Sailors' Home, \$72,500; Soldiers' Orphans' Schools, \$132,393.01; common schools, \$2,289,859.55; National Guard, \$416,689.80; disasters by floods, \$383,602.62; monuments at Gettysburg, \$10,500; pensions and gratuities, \$5,952.75; State College, \$24,057.70; Philadelphia Academy of Natural Sciences, \$25,000; Museum and School of Industrial Art, \$10,000; Nautical School ship, \$10,750; Gettysburg Memorial Association, \$7,500. Other items brought the total amount of expenditures to \$10,453,952.64, leaving a balance, Nov. 30, 1891, of \$6,979,854.55.

The public debt, Nov. 30, 1890, was \$12,349,920.28; on Nov. 30, 1891, it was \$9,811,568.28; total redeemed, \$2,538,352. Following is a statement of the funded debt: $\frac{3}{4}$ -per-cent. currency loan \$1,642,900; 4-per-cent. currency loan, \$6,072,650; 5-per-cent. currency loan, \$1,444,800; 6-per-cent. Agricultural College scrip bond, \$500,000; proceeds of sale of experimental farms, \$17,000; total interest-bearing debt, \$9,677,350. The unfunded debt and debt upon which interest has ceased was as follows: Relief notes in circulation, \$96,143; interest certificates unclaimed, \$4,448.38; interest certificates outstanding, \$13,088.54; 6-per-cent. Chambersburg certificates unclaimed, \$148.66; domestic creditor, \$25; 5-per-cent. bonds upon which interest has ceased, \$18,414.70; 6-per-cent. bonds upon which interest has ceased, \$2,000; total debt bearing no interest, \$134,218.28. The statement of debt redeemed is as follows: $\frac{3}{4}$ -per-cent. loans redeemed by purchase, \$20,600; 4-per-cent. loans redeemed, \$900; 4-per-cent. loans redeemed by purchase, \$658,550; 5-per-cent. loans redeemed by purchase, \$1,858,300; relief note of \$2 canceled; total debt redeemed, \$2,538,352.

Education.—The report of the Superintendent of Public Instruction for the year ending June 1, 1891, gives the following statistics: Number of school districts, 2,338; number of schools, 22,884; number of graded schools, 10,940; number of superintendents, 122; number of male teachers, 8,171; number of female teachers, 16,754; whole number of teachers, 24,925; average salary of male teachers per month, \$40.59; average salary of female teachers per month, \$30.90; average length of school term in months, 7.76; number of pupils, 969,506; average number of pupils, 699,937; cost of tuition, \$7,261,456.05; cost of building, purchasing, and renting, \$2,892,667.68; cost of fuel, contingencies, debt, and interest paid, \$3,364,584.25; total cost of tuition, building, fuel, and contingencies, \$13,578,708.98; State appropriation, \$2,000,000; estimated value of school property in counties, \$17,362,027; estimated value of school property in cities and boroughs having superintendents, \$18,475,867.84. For the city of Philadelphia alone the report was as follows: Number of schools, 2,694; number of male teachers, 105; number of female teachers, 2,589; average salary of male teachers per month, \$133.20; average salary of female teachers per month, \$60.24; number of pupils in school at end of year, 114,306; average attendance, 107,688; paid for teachers' salaries, \$1,568,124.21; paid for houses, additions, and repairs, \$639,375.18; paid for books, fuel, stationary, and contingencies, \$534,894.19.

The net increase in number of districts for the year was 12; in number of schools, 519; in number of graded schools, 190; decrease in number of male teachers, 211; increase in number of female teachers, 643; in salary of male teachers, 73; in salary of female teachers, 30; in school term in months, 38; in number of pupils, 4,062; in cost of tuition, \$323,766.08; in cost of building, purchasing, and renting, \$154,240.27; in cost of fuel, contingencies, debt, and interest paid, \$112,270.53. In the 13 normal schools the total number of male students was 3,417; of female students, 4,118; number of male students in the normal department, 2,676; of female students, 3,327; of boys and girls in the model schools, 1,537; number graduated in the elementary course, 694; graduated in the scientific course, 5; number who intend to become teachers—males 547, females, 820; number who have received aid from State as students—males 1,696, females 2,318; number who have received State aid as graduates—males 285, females 398. The value of buildings and grounds is estimated at \$1,947,363.97, and the total value of property, including furniture, libraries, musical instruments, apparatus, etc., \$2,410,504.36. The amount of debts was \$2,193,568.48, and the cost of improvements and expenses \$200,125.21. The income amounted to \$677,544.16, of which \$66,250 came from State appropriations; the total expenditure was \$620,612.99. The superintendent reports that in many counties the directors are regularly organized in convention, and meet statedly to consider the best solutions of the problems before them. He recommends a lengthening of the school term in the short-term districts, the minimum now being twenty-four weeks, and a law for compulsory education. On this point he says, that while the population of the State has increased within the decade about 23 per cent., and that of the cities nearly 43 per cent., the increase in the public schools is but 11 per cent. He also recommends the introduction of manual training (see *MANUAL TRAINING SCHOOLS* in this volume), and the providing of free text-books. The number of schools supplying them has increased from 1,517 in 1890 to 1,908 in 1891. In reference to appropriations for the public schools, he says: "When the framers of the Constitution of 1873 provided that at least \$1,000,000 should be appropriated each year to the public schools, the generous sum was regarded as excessive by the opponents, and was highly commended by the friends of the schools as almost unprecedented in liberality. It required fifteen years to double that sum. The General Assembly of 1891 has shown its appreciation of the schools, and its expectation as well, by making the annual appropriation five times the sum named in the Constitution."

The Governor's Inaugural.—Gov. Pattison was inaugurated on Jan. 20. In his address he advised legislation to guard the people against the encroachments of corporations. He advocated the Australian ballot system as a remedy for abuses of the suffrage, and urged the early calling of a constitutional convention to remove from the Constitution the provision requiring every ballot to be marked for identification, and the provision that non-registration shall not debar an elector from voting.

In discussing taxation, he said houses and farms bear a vastly disproportionate share of the burden, while personal property and idle capital largely escape their share. The tax on corporations, which is just and easily collected, and the collateral-inheritance tax, furnish sufficient revenue for State expenses. It was therefore recommended that all other taxes and license charges be remitted to the counties. The office of Mercantile Appraisers should be abolished. He suggested that the State Treasurer be relieved from the dangerous discretion of selecting the places of deposit of public funds, and that the money be disposed of by law. Among other changes suggested were reapportionment of the State, an effective civil service in the State appointments, the substitution of salaries for fees, the inspection and regulation of State and private banks, and an extension of the power of the Auditor-General so as to include within his audit all the State accounts, and the rigid enforcement of the law referring to the investment of the sinking-fund money. The mining code should be revised in such manner as will insure the payment of damages in case of injury or loss arising from the neglect or parsimony of the mine-owner.

Legislative Session.—The Legislature began its biennial session in January, and adjourned on May 28. It passed 414 measures, of which 12 were recalled before the Governor had passed upon them. Of the 402 remaining the Governor signed 317 and vetoed 85. Among those passed were the following:

- Submitting the question of a constitutional convention to the people at the November election.

- Providing for ballot reform.

- To relieve employes from certain prosecutions and punishments for conspiracy under common law or under the criminal law.

- Providing for the formation of the border-raid commission.

- Extending the jurisdiction of the courts in cases of divorce.

- Securing the rights of subcontractors to file mechanics' liens, and preventing interference with this right by contractors.

- To create a banking department.

- Appropriating \$10,000 for the completion of the publication of the geological survey.

- Authorizing married women to organize corporations and to be officers thereof.

- Requiring registry assessors to visit in person every dwelling-house in their election districts or divisions on the first Mondays of May and December of each year, or as soon thereafter as practicable. This is intended to prohibit the assessor from taking up the transcript or list of voters of the previous assessment. An entirely new registration is to be made.

The appropriation bills for 1891 and 1892 aggregated about \$13,800,000, of which the Governor vetoed items to the amount of \$60,850. The largest item of the appropriation was \$10,000,000 for public schools. The increase in State expenses for the two years is about \$150,000.

Among important bills vetoed was one for compulsory education. Acts for reapportionment of Assembly and congressional districts, to continue till the reapportionment directed by law to follow the next decennial census, and a bill for reapportionment of judicial districts were also vetoed. An act authorizing cities of the State to change, alter, beautify, and improve unpaired

public wharves and landings was vetoed on the ground that it would give city councils the power to deprive important shipping interests of such uses of the water fronts as are essential to their success and of great value to the municipalities.

The Governor's nominations for the offices of Superintendent of Public Instruction, Factory Inspector, and City Treasurer of Philadelphia were rejected by a vote of 16 to 31.

Liquor License.—On June 19, 1891, the Legislature passed an act intending to amend the Brooks law to allow saloon keepers to have bonds from any part of the county, instead of ward or township. The amendment was to the act approved May 24, 1887, whereas the Brooks law was approved May 13, 1887. The act amended was one providing for wholesale liquor licenses, and as a result the judges can refuse all license applications because they do not conform to the law.

The Bardsley Case.—On May 21 John Bardsley, Treasurer of the city and county of Philadelphia, who was elected in 1888, and whose term would not have expired till the end of 1891, retired from the discharge of his duties on account of losses of State money placed by him in the Keystone National Bank and tendered his resignation, to take effect on May 30. He was arrested on May 23 on the charge of misappropriating money. It was discovered that he had failed to pay over large sums collected for the State, and that no adequate security had been given for their payment. Criminal prosecution resulted in his plea of guilty, and a sentence to fifteen years' imprisonment in the Eastern Penitentiary for the conversion of public moneys to his own use and for loaning them for interest. The following statements are taken from the Governor's message to the Senate:

The complicated transactions of the ex-Treasurer were the subject of investigation by city and State committees, and representatives of the Treasury Department of the United States were engaged for many weeks examining the books of the national banks in which city and State funds were deposited. The investigations seemed to show that John Bardsley, during most of his official term, was allowed to keep and use a large amount of money which he should have paid into the State treasury, and that he was never called upon by the State Treasurer and the Auditor-General to make the account which the law requires them to exact. The sums so retained by him amounted to more than \$1,250,000. His books indicated that, besides the salary, fees, and commissions to which he was entitled, he had made as interest dividends and bribes nearly \$300,000, the greater part of which was paid to him for the use of the State funds which he was allowed to retain, and for his exercise and abuse of powers, in association with and under control of the departments of the State Auditor and Treasurer. The memoranda and stubs of checks also indicated that Bardsley received large sums of money from publishers of newspapers to which he gave the advertisements of mercantile appraisal lists, paid for by the State. The five appraisers were appointed by Bardsley and the State Auditor-General, and it appeared on investigation that they had returned for advertisement a large list of fictitious names, of persons not residing at the places named, of persons from whom no taxes could be collected, of persons whom they themselves had exempted from year to year, and persons against whom the State had brought fruitless suits at enormous cost for collection again and again; so that out of a total appraisement of

\$529,799 for 1889 and 1890 the deductions for uncollectible taxes, half the cost of publishing the list (the other half being charged to the liquor licenses), and the cost paid to magistrates and constables in cases where the State received nothing, amounted to nearly \$250,000. The costs of advertising the lists for the two years were about \$270,000, although the Auditor-General testified that no public advantage resulted, and that it was a complete waste of public money. For the same years the costs in delinquent taxes amounted to \$200,000 and over, for which not a dollar was realized; and the credits given for uncollectible taxes amounted to \$425,000. Proceedings were instituted in the criminal courts against the mercantile appraisers.

The testimony of the Auditor-General and the State Treasurer showed that the moneys collected by Bardsley which he failed to pay over amounted to \$1,366,378.59, of which only \$120,000 was secured. In addition to this sum, there was paid to him from the State treasury, Dec. 30, 1890, \$420,000 for the public schools of Philadelphia, no portion of which was applied for that purpose. This was drawn five months before the ending of the school year and seven before the warrants of any one of the other 2,300 school districts were drawn, for the purpose of reducing the balance of money in the general fund below the limit of \$1,550,000, apparently in order to evade the operation of the law requiring the State Treasurer to apply all sums exceeding that amount remaining in the general fund at the beginning of the year to the sinking fund for investment in interest-bearing securities. The cashier of the State Treasurer's office, William Livey, who drew these warrants, left the State at the beginning of the exposures and remained beyond the reach of the officials and investigating committees desiring his evidence.

Of tax and license moneys that were eventually paid in to the State treasury, large amounts were allowed to remain in the city treasurer's hands long after the time designated by law for their payment. Some were thus retained for his personal use for more than a year. The Auditor-General is required by law to require the payment under penalties; but no penalties or interest were charged and no commissions abated. On the contrary, letters were found from the State Treasurer and the Auditor-General encouraging the city treasurer to retain the funds in his hands.

Special Session.—In view of these facts and the charges against the two State officers, the Governor called a special session of the Senate to meet Oct. 19 for the purpose of investigating the charges and determining whether reasonable cause existed for their removal from office. The message set forth the facts in detail as they had been elicited during the investigation. It recommended also careful inquiry "to ascertain whether reasonable cause existed for the removal of any of the magistrates or constables of Philadelphia because of faithless or dishonest conduct in the performance of their official duties."

The Senate decided to investigate in open session, to request the Attorney-General to assist, and to allow the accused to be heard in person or by counsel. The Auditor-General's reply, through his counsel, to the Governor's charges denied the jurisdiction of the Senate, affirming that under the Constitution he could only be removed on conviction of misdemeanor before a criminal court or on impeachment by the House of Representatives and after trial and conviction by the Senate, the Senators at the time being "upon oath or affirmation." He denied every charge, claiming to have acted in accordance with the law as understood and interpreted by him and his predecessors, and in conformity

with the established usage of his department. The State Treasurer made a similar answer.

A resolution declaring it to be the sense of the Senate that all questions of malfeasance and nonfeasance in regard to the official acts of the said officers were the proper subjects of inquiry in the investigation was tabled, thus postponing the question of jurisdiction. The testimony taken before the joint committee of the Legislature was read. After examination of the accused Treasurer, the argument of his counsel claiming that the Senate had no jurisdiction was heard, the magistrates and constables affected put in a similar plea, and the Senate finally, after a month's deliberation, adopted a resolution declaring that it had no jurisdiction under the Constitution to inquire into, hear, and determine the charges of official misconduct, and to address the Governor asking for their removal. The resolution was adopted by a party vote of 28 Republicans to 19 Democrats.

Election.—At the State election in November the candidates of the Republican party were David McM. Gregg for Auditor-General and John W. Morrison for Treasurer. The Democratic candidates were Robert E. Wright for Auditor-General and A. L. Tilden for Treasurer. The Prohibitionists nominated Messrs. Hague and Drayton for the two officers. The result of the vote was as follows: For Auditor-General, Gregg, 414,583; Wright, 356,431; Hague, 18,511; Gregg's plurality, 58,152. For Treasurer, Morrison, 412,994; Tilden, 358,617; Drayton, 18,429; Morrison's plurality, 54,377.

The question of calling a convention to revise the Constitution was submitted to the people at this election, and was lost by a vote of 173,813 for to 420,598 against the convention. It was desired, among other changes, to introduce the Australian ballot system.

Appointments.—Judge Silas M. Clark, one of the associate justices of the Supreme Court, died on Nov. 20, and on Nov. 28 the Governor appointed Charles E. Heydrick, of Franklin, to succeed him. Charles H. Krumbhaar, of Philadelphia, was appointed Superintendent of the Banking Department, an office created at the last session of the Legislature. W. H. Davis was appointed member of the Geological Survey in place of Jacob Turney, deceased, and B. P. Opdyke, director of the Nautical School.

Riot in the Coke Region.—On April 2 a riot broke out in the coke region. A mob of several hundred strikers attacked the Standard Works, destroyed some of the property, and cut the wires so that no warning could be sent to Morewood. A party of several hundred set out for that place, but meantime the wires were repaired and warning given, and the deputy sheriffs were in readiness to meet the attack. As the rioters passed the company's store they made an attack on it, and raided it as far as they could in a brief time. They then marched to the barn inclosure and attempted to break down the gates. They succeeded in doing this, and as they entered, Capt. Lauer called out to them to halt or he would fire upon them. Their answer was a volley in the direction of the deputies, none of whom was seriously injured. The captain then gave the order, and two volleys were fired before the mob broke and ran. Seven

men fell dead in the road, and about 40 were wounded. The rioters then broke up into small groups and make their escape in various directions. The men killed were all foreigners, most of them Slavs. Two of the wounded died later. Warrants were issued charging the deputies with murder. The rioting was continued by mobs at Leisenring, Monarch, and other places. The coke companies swore out injunctions against 33 of the leaders and instituted criminal charges against them. When evictions were attempted the women fought furiously, and took the lead to a great extent, the men either remaining inactive in obedience to their leaders, or thinking the sheriff and troops would be more careful where women were leading. Workmen were brought in by the car load from outside, and the works started up again.

Supreme Court Decision.—An important decision was rendered by the Supreme Court in the case of the Pullman Palace Car Company against the Commonwealth of Pennsylvania. The Legislature passed an act that the car company should pay tax on its property within the State, the amount on which it was to be assessed to be found by ascertaining the proportion which the number of miles of road within the State over which the company's cars ran bore to the total number of miles in the United States over which they ran, and then dividing the capital stock of the company by the proportion. It was contended by the company that this law was unconstitutional for the reason that it was a regulation of interstate commerce, and that its cars could be taxed only in the State of Illinois. The court, in an opinion by Justice Gray, upholds the constitutionality of the law. "The old rule by which personal property was supposed to follow the person of the owner," it says, "has been modified very much in modern times. In matters of taxation the question is one of legislative powers, and it is for such State legislatures to say whether a company's property shall be taxed at the place of its incorporation or at the place where it goes. There is nothing in the Constitution or laws of the United States preventing a State from taxing property employed therein, like other personal property."

Constitutional Revision.—The vote on the question of calling a convention to revise the State Constitution was as follows: For a convention, 173,813 votes; against, 420,598; majority against a convention, 246,785.

Political.—Elections for Auditor-General and State Treasurer were held in November, and resulted in the election of D. McM. Gregg for Auditor-General, and John W. Morrison for Treasurer. The vote stood: For Treasurer—Tilden, Democrat, 358,617; Morrison, Republican, 412,994; Drayton, Prohibitionist, 18,429. For Auditor-General—Wright, Democrat, 356,431; Gregg, Republican, 414,583; Hague, Prohibitionist, 18,511.

PERSIA, an empire in central Asia. The Shah-in-shah is absolute ruler of the country. Nasreddin Shah, born July 18, 1831, is the fourth of the Shiite Kadjar dynasty, which was established on the throne after a long civil and religious war in 1794. He succeeded his father, Mohammed, on Sept. 10, 1848. The Shah claims obedience as vicegerent of the prophet, though

his spiritual powers are denied by a large proportion of the *syeds* and *mollahs*. The Grand Vizier, who unites the functions of Minister of the Interior, of the Court, and of the Treasury and Customs, is Mirza Ali Askar Khan. Kamran Naib-es-Saltaneh, the Shah's third son, is Minister of War, and commander-in-chief. The Minister of Foreign Affairs is Kavamed Duleh.

Area and Population.—The area of the modern Empire of Persia, which was consolidated in 1502, is about 628,000 square miles. The population was officially estimated in 1881 at 7,653,600 inhabitants, of whom 1,963,800 lived in the cities, 3,780,000 were settled in villages and in the open country, and 1,909,800 belonged to the nomadic tribes. The city of Teheran has about 210,000 inhabitants; Tabriz, 180,000; Ispahan, 90,000; Meshed, 70,000.

Finances.—The revenue for 1888-'89 amounted to 54,487,630 kran, equal at the current price of silver to \$7,804,000, while the expenditure amounted to 50,100,000 kran. For 1890-'91 the revenue was estimated at \$8,644,000. Out of the total sum expended in 1888-'89 the army consumed 18,000,000 kran; 10,000,000 kran went for pensions; 3,000,000 kran for allowances to the princes, and 600,000 kran to other members of the Kadjar family, of whom only 146 are inscribed in the official register, although there are several thousand others; 800,000 kran for the diplomatic service; 5,000,000 kran for the court; 500,000 kran for colleges; 1,500,000 kran for the civil service; 2,630,000 kran for local government; and 800,000 kran for remission of taxes in poor districts. The revenue is raised by taxes assessed on the cities, districts, and villages, the amounts being adjusted from time to time by tax assessors. About a sixth part of the taxes are paid in kind.

The Army.—The army is raised by tribal levies, and in time of peace the troops are not called into active service, except those that are required for service on the frontiers and to garrison the principal towns. In the arsenals there are 50,000 Werndl rifles and 74 Uchatius guns, of which 18 have the caliber of 9 centimetres, 16 of 8 centimetres, and the rest have 7 centimetres caliber. There are also 500 or 600 old smooth-bore cannons. The garrison of Teheran consists of 3 regiments of Cossacks, of 400 men each, and a battery of 6 guns. The war effective is stated at 80 battalions of infantry, of 1,000 men each; 23 battalions of field artillery, of 200 men each; and 125 squadrons of irregular cavalry, of 200 men each. The force that is properly equipped and is fit for field service is supposed to be about 54,000 men. The naval force consists of 2 gunboats, the larger one of 600 tons and armed with 3 guns.

Commerce.—The principal articles of importation are cottons and other tissues, glassware, paper, iron, copper, sugar, petroleum, and tea. The chief exports are rice, opium, tobacco, skins, silk, carpets, gums, wool, dates, and grain. The statistics of the foreign trade are reckoned from the amounts turned in by the farmers of customs, who collect a 5-per-cent. duty from foreign merchants and from 3 to 8 per cent. from native Persians, and retain as their profit about one sixth of the amount received. The total value of the foreign commerce in 1889 was about

\$42,000,000, of which \$16,000,000 represent exports and \$26,000,000 imports. The annual export of opium averages 8,000 boxes, valued at \$3,250,000. The value of dried-fruit exports is about \$1,500,000; of cotton, \$900,000; of carpets, \$600,000; of tobacco, \$550,000; of grain and legumes, \$475,000. The statistics of imports and exports are very imperfect, because the farmers of customs are interested in concealing the amount of the trade, and because there is a great deal of smuggling on the Russian and Turkish frontiers. Tobacco, which is the third article in importance in the list of exports, occupies a more important place in the estimation of the people than even food and clothing, and any cause that has the effect of raising its price diminishes the power to purchase the necessities of life. The *tumbeki*, or water-pipe tobacco of Persia, supplies the bazars of Turkey, Egypt, and central Asia; the *tutun*, or tobacco for the *chibouk* or long pipe, is also exported in large quantities to Arabia, Asia Minor, and the Caucasus; and the cigarette tobacco grown in Ghilan and Mazandaran is exported to Russia, except the small proportion required for home consumption. The greatest care is taken in the cultivation and preparation of tobacco for the market, which gives employment to a vast number of people, and many more are employed in transporting it to the inland markets and seaport towns, while the Government has always collected a large revenue from customs, transit dues, and plantation tithes levied on this article. The estimates of foreign consuls make the total annual production of tobacco 21,700,000 pounds, of which 14,000,000 pounds are consumed in the country and 7,700,000 pounds are exported.

Communications.—A small railroad, 6 miles long, connecting Teheran with Shah Abdulazim, was opened in July, 1888, and since then a Persian capitalist has built 20 miles of railroad between the Caspian port of Mahmudabad and the city of Barfurush. The former railroad, constructed by a Belgian company under Russian auspices, is to be extended to Reshd, on the Caspian. The Russian Gen. Komaroff has planned to build a railroad from the Russian frontier to Meshed, while an English company has projected a rival line for the benefit of the trade with Great Britain and India, which will run from the port of Muhammerah, on the Persian Gulf, to Teheran. An English firm runs a steamer from the mouth of the Karun river, at the head of the Persian Gulf, to Ahwaz. The telegraphs belonging to the Government have a total length of 2,674 miles of single wire. The Indo-European Company works a line of 735 miles, with 2,205 miles of wire, between Bushire and Ispahan and 415 miles, with 1,245 miles between Teheran and Julfa. The post-office, organized by Austrian officials in 1877, carries letters regularly between the principal cities.

Political and Financial Affairs.—The hopes of the Russians to extend their political influence in Persia by means of commercial enterprises have not met with much success, and those of the English with still less, thus far. Sir Henry Drummond Wolff, who was succeeded in the British legation at Teheran in the autumn of 1891 by Sir Frank Lascelles, obtained various concessions after his arrival in November, 1887,

which the Shah was willing to grant as a means of playing off the English against the Russians, who had secured a monopoly of the trade of northern Persia by prohibiting the transit of English goods by the Black Sea to the Caspian. The opening of the Karun route, from which much was expected, has proved valueless because the means of transport from the head of navigation through the desert regions to the centers of population and of consumption in the northern provinces are primitive and very expensive. The Shah granted in 1889 the right of establishing a national bank, with the power of issuing bank notes not exceeding the sum of £800,000, without the further consent of the Persian Government to Baron Julius de Reuter, who formed an English company and began business in Persia in October, 1889. This company acquired in April, 1890, the business of the New Oriental Bank of London, which had established branches in Persia in the summer of 1888. It has the exclusive privilege of working all iron, copper, lead, mercury, coal, petroleum, manganese, asbestos, and borax mines not already conceded. For the first ten years its notes must be protected by a reserve of 50 per cent. in silver, and after that by 33½ per cent. A monopoly of tobacco, which was farmed out to the Imperial Tobacco Corporation, went into operation in February, 1891. The concessions granted to Europeans aroused an antipathy against foreigners, which was encouraged by the speeches of fanatical *mollahs* and led to a riot at Shiraz during the feast of Ramazan. The tobacco monopoly was so unpopular that it could not be carried into effect, and therefore the Shah canceled the arrangement and abolished the monopoly by a proclamation issued on Dec. 27. Serious disturbances occurred before this was done. The *mujtahid*, or Shiite high priest, headed a revolt in Mazanderan in November, which it required a large body of troops to put down. Negotiations for an extradition treaty between Russia and Persia, which should apply to political refugees, were carried on in the autumn, and it was rumored that Russia had proposed a commercial union or treaty of reciprocity, which should have the effect of excluding other nations from participation in the foreign trade of Persia, and even an arrangement, implying a virtual protectorate, by which Russian diplomatic representatives should attend to the political interests of the Persian Government in foreign capitals.

PERU, a republic in South America. The Senators, in the proportion of 1 to every 30,000 inhabitants, and the Representatives, 2 from the departments having 2 provinces, and 1 more for every additional 2 provinces in the other departments, are chosen indirectly by provincial electoral colleges composed of delegates of the parochial electoral colleges. The President, who is elected for four years, appoints his Cabinet of 5 ministers. Col. Remigio Morales Bermudez was inaugurated as President on Aug. 10, 1890. The 2 Vice-Presidents, who take the place of the President in case of his death or incapacity, are Pedro Solar and Col. Bergono. The Cabinet first appointed resigned on Aug. 24, 1891, having refused to answer interpellations in the Senate regarding the attempted revolution

of December, 1890. The new ministry was constructed as follows: Prime Minister and Minister of War, Justiniano Bergono; Minister of Foreign Affairs, Juan Elmore; Minister of the Interior, Señor Lerra; Minister of Justice, Señor Serpa; Minister of Finance, Señor Carbajal.

Area and Population.—The area of the republic, which is divided into 19 departments, is 463,747 square miles. The population, as determined by the census of 1876, was 2,621,844, not including 350,000 uncivilized Indians. Lima, the capital, has 101,488 inhabitants. The Catholic is the state religion, and the public exercise of other forms of worship is prohibited, though in practice Protestant and Jewish worship is tolerated. Education is free and compulsory. About 20 per cent. of the people are of Spanish descent, 23 per cent. are of mixed blood, and 57 per cent. are Indians.

Finance.—The revenue for 1890 amounted to 6,957,349 silver soles or dollars, of which 4,995,944 soles were derived from customs, 914,150 soles from internal taxes, and the rest from railroads, posts, telegraphs, and other sources. The expenditure amounted to 6,073,967 soles, of which 2,257,977 soles were spent on the army and navy, 1,076,632 soles on financial administration, 1,012,994 soles on the interior, 412,580 soles on justice, 220,807 soles for foreign affairs, 753,916 soles on railroads and for extraordinary purposes, and 339,061 soles for other purposes.

The foreign debts that were contracted in England in 1870 and 1872 for the construction of railroads amounted to £31,579,080, without counting defaulted interest. It was secured on the guano deposits that were seized by Chili. No interest has been paid since 1876, and the arrears in 1889 amounted to £22,998,651. An arrangement was made with Chili by which a certain percentage of the guano should go to the bondholders. By the Grace-Donoughmore contract, finally concluded in January, 1890, the Peruvian Government obtained a release from all responsibility for the two debts by ceding all the state railroads to the English council of foreign bondholders for sixty-six years, and transferring the mines, lands, and guano deposits belonging to it, while the bondholders agreed to complete and extend the system of railroads. For the conversion of anterior obligations, a limited-liability company has been constituted in London. The internal debt was officially estimated in 1888, at 109,287,000 soles, not including 83,747,000 soles of paper money. The interest on the internal bonds has been reduced to 1 per cent., and their market price in 1891 was 11 per cent. of their nominal value. The paper notes and incas are no longer accepted as money, and by a recent law they may be exchanged for internal bonds at the rate of 1 sol in bonds for every 15 soles of notes, the inca being reckoned at 8 soles in notes.

The Army and Navy.—The law of Nov. 20, 1872, introduced obligatory military services for three years in the active army and two years in the reserves. Substitution is nevertheless permitted, and the annual draft is only 1,383 men. The peace effective consists of a body of gendarmerie, numbering 150 officers and 3,350 men; 7 battalions of infantry, with about 290 officers and 2,833 men, who are armed with Peabody

and Martini-Henry rifles; 3 regiments of cavalry, numbering 80 officers and 800 men; and 1 regiment of field artillery, numbering 33 officers and 360 men, consisting of 4 batteries of 8 pieces each, mostly Krupp guns of the model of 1880. The naval force consists of the cruiser "Lima," of 1,790 tons, and 2 steam transports.

Commerce and Production.—The agricultural products of Peru are sugar, cotton, coffee, cacao, rice, and tobacco. The coast region, in which the main part of the cultivated land is situated, could be made more productive by irrigation, and in the mountains the area of cultivation could be greatly extended. Sugar is the most important crop. The yield was formerly 100,000 tons a year, and it is now about 70,000 tons of sugar, of which 50,000 tons, valued at \$4,000,000, are exported. Rum is manufactured also in large quantities. In the northern provinces the cane is planted once in six or seven years. Cotton also is grown in the north without replanting, being gathered from a tall shrub which bears for several years. The fiber is coarse, and is used chiefly for mixed woollen textures. The annual value of the crop is about \$3,000,000. Rice, though less certain, yields abundantly on the low plains in the north, when the season is favorable. Coffee is raised of good quality, but not in excess of the domestic demand. The grapes of the southern coast provinces are celebrated, and the annual product of wine is valued at \$4,000,000. The Irish potato grows luxuriantly, both in the mountains and in the lowlands, and corn, which in some places yields 2 crops a year, constitutes the staple food of a large part of the population and supplies the national beverage, the stimulant called *chicha*. The cacao of Cuzco and the protected valleys of the Sierra is of superior quality. Coca flourishes in the hot valleys on the eastern slope of the Andes, and is cultivated to some extent, as well as gathered in its wild state. The wanton destruction of cinchona trees in accessible localities has given the planters of the British and Dutch East Indies the advantage in supplying what was once a great staple of Peru. Alfalfa is raised extensively for fodder. Wool is grown on a large scale in the mountains, and exported to the amount of \$4,000,000 a year. The exports of the valuable wool of the alpaca and the vicuña are considerable. Of the forest products the most important is India-rubber. Sarsaparilla and other medicinal plants, vegetable ivory, balsams, and dyes are also exported. The deposits of guano and of cubic niter have for the most part been ceded to Chili, and the guano rocks remaining in the possession of Peru have been nearly exhausted. The mineral products of the country are many and varied. The principal silver mines are Cerro de Pasco, Castrovicuna, and Recuay. The silver produced in Peru and that contained in the 12,500 tons of ore exported in 1888 was 120,000 kilogrammes. Great quantities of lead are also extracted. Gold is found in all the departments excepting three. Most of the fields have been abandoned by foreign miners. Rich washings in the streams flowing into the Amazon and promising ledges in the eastern Cordillera are not worked on account of their remoteness from the coast and the difficulties of transport. Sulphur, gypsum,

asphalt, and petroleum are found in extensive deposits, though these resources are not yet utilized. Vast beds of coal, both bituminous and anthracite, have been discovered in the northern mountains in localities not yet provided with railroads. The great deposit of salt near Huacho, on the coast, is constantly renewed by the percolation of sea water through the porous rock.

The foreign commerce is chiefly carried on with Great Britain, with France, of late years with Germany also, and to a not inconsiderable extent with the United States. The total reported value of the imports in 1887 from Great Britain was \$3,489,869, consisting mainly of cotton manufactures (constituting two fifths of the total), and of iron and steel goods, wool manufactures, linen, and coal. The imports from France were \$1,055,625, the chief items being leather, woollens, apparel, and fancy articles. The imports from the United States, \$717,968 in value, were more varied in character than those from any other country, the largest items being cotton goods, manufactures of iron and steel, provisions, and furniture. The imports from Germany were valued at \$330,334, more than half of this sum representing manufactures of flax. The exports to the United Kingdom in 1887 amounted to \$7,981,916; to France, \$4,794,107; to Germany, \$1,656,718; to the United States, \$309,040. The cubic niter, except the small proportion taken by the United States, goes in nearly equal amounts to France and England, raw sugar and cotton to England, and hides and skins to France and the United States, while Germany received nearly the whole of the silver ore and very little else. The exports to Great Britain in 1888 amounted to \$9,541,080, and in 1889 to \$6,297,139, while the imports from Great Britain were \$5,589,715 in the former and \$4,663,562 in the latter year. The exports to France were valued at \$8,030,249 in 1888, and at \$8,670,831 in 1889, four fifths consisting of nitrates, while the imports from France in those years were \$1,071,949 and \$1,332,090, respectively. The exports to the United States were \$309,040 and \$314,332, and the imports from the United States \$865,160 and \$773,244 in the respective years.

Railroads and Telegraphs.—The Peruvian railroads have a total length of 1,625 miles, built at a cost of over \$150,000,000. The State telegraph lines in 1889 had a length of 1,564 miles. The American cable on the west coast gives communication with all the world.

PHOTOGRAPHY, RECENT PROGRESS IN. The advances of photography within the past few years, while not realizing certain extravagant predictions prompted by the early successes of the dry plate, have been in many respects extraordinary. This activity has been due largely to the increasing popularity of the camera among amateurs, and largely also to the increasing usefulness of photography in various sciences and in the reproductive processes. The popularization of the camera has not always fostered a recognition of the essentially scientific basis of photography and the artistic phases of the product have sometimes tended to obscure the mechanical and chemical requirements. Now that much of the novelty of "instantaneous" picture-making has worn off, the first principles of the science are receiving more general attention.

Lenses.—An important advance in the manufacture of lenses has resulted from the recent adoption of Jena glass by Carl Zeiss, who has obtained objectives entirely free from spherical aberration and astigmatism. Another interesting movement is made by Dallmeyer in the production of a telephotographic lens for giving enlarged images of distant objects. Enlarged images have hitherto been produced by long-focus lenses, or by placing a secondary magnifier behind the plane of the primary image. The new lens is composed of two elements, and the image formed by it is primary and inverted. The anterior element is a positive lens of large aperture and short focus; the posterior lens is a negative element of a fractional part of the focal length of the anterior positive; and in estimating the rapidity or intensity, the shorter the focus of the posterior lens as compared with that of the anterior lens the greater is the size of the image for a given extension of the camera. The main object of the invention is to throw the nodal point from which the focus is actually measured to any desired distance into a space in front of the lens itself, thus attaining a large image without the aid of a bulky apparatus. The lens is said to possess wide adjustability, and to promise important results in astronomical photography. A new Gundlach lens is on the basis of Steinheil's double meniscus, which has been transformed into a triple meniscus. A flint-glass lens is inclosed and protected by crown-glass lenses, ground so thin as to minimize the possibility of a yellow tinge. English lens makers have urged an agreement on some uniform plan for the threads and flanges of lens mounts.

Cameras.—Improvements in cameras have been generally in the direction of greater lightness for field work, the substitution of cams and other devices for screws, etc., to facilitate rapid adjustment, and the development of the swing-back and reversing features. The most striking advance has been in the devising of hand cameras. Cameras that might be operated without a solid rest became possible when negative surfaces reached a stage of sensitiveness permitting an adequate exposure in a fraction of a second. With the improvements in the dry plate have come a multitude of portable cameras, many of them of great ingenuity. The earliest examples were provided with an automatic exposur or shutter, capable of speed adjustment to meet the requirements of the light and the amount of motion to be overcome. A device, aided by an exterior indicator, adjusted the focus by an estimate of feet, and provided for the use of the universal focal point in the lens. A small camera-obscura attachment enabled the operator to locate the image. Recent modifications have aimed at a reduction of weight, and at convenient methods of storing plates or films within the box. The panoramic idea has been worked out with films and with paper rolls, and many magazine forms have been adopted, though few have been entirely satisfactory. Roll surfaces are arranged to receive 100 or more impressions. Magazines for glass or cut films usually provide for one or two dozen negatives.

Among the cameras devised with a view to unobserved operation there are many curious forms. One German camera takes the shape of

a book. Another is operated in the hat. A vest camera has been used in this country, and many of the more conventional forms are placed in cases resembling satchels, lunch baskets, etc.

The development of the hand camera has had an important influence on the arrangement of cameras in general. Many of the later tripod cameras are now provided with a variety of convenient devices, facilitating the use of the camera under conditions demanding readiness and portability. Among the fanciful results of recent improvements in rapid photography has been the automatic arrangement that takes its place beside the weighing machine and the public phonograph. The "nickel-in-the-slot" photographing machine resembles a round stove. On opening the iron door a clockwork is seen below, putting the whole mechanism in motion by a spring. The principal feature is a vertical axis acting as rotating power for a plate-catcher. At the moment the piece of money is dropped, shutting off the electric current, a ferrotype plate drops from a carrier and is caught by the catcher and moved horizontally around a ring in a vertical position. This ring contains several circular dipping baths of gutta-percha, into which the plate, held by the catcher, is immersed and then raised at certain intervals. The plate passes first the collodion bath, after that the silver bath, and then the bell sounds, warning the sitter to be quiet, and the exposure takes place. The plate now plunges into the developer, washing bath, fixing bath, and again into water; then it is moved outside of the circle and dried over a flame. The entire process occupies about two minutes.

Sensitive Surfaces.—Dry plates continue to increase in sensitiveness, though makers are now content to promise even an infinitesimal advance. The complaint that more attention is paid to the attainment of rapidity than to a better image-bearing quality is often justified.

Gaedicke, of Berlin, has announced the invention of a collodion emulsion which is claimed to be equal in sensitiveness to the most sensitive gelatin emulsion. The new emulsion is said to be easy to manipulate, and to be capable of producing results rivaling those of any other method. The announcement is of particular interest to those who have been loyal to collodion processes throughout all the advances of the gelatino-bromide emulsion. For certain classes of work, particularly for lantern positives, the collodion processes have never been equaled by the later processes.

The practice of "backing" plates has come into favor, especially among out-of-door workers. Talbot Archer mentions two backings as finding special favor in England. The first is bitumen dissolved in benzine and poured on the back of the plate. It hardens in a few minutes and is removed with the help of a broad chisel before development. The other is a creamy mixture of burnt umber or burnt sienna with gum and methylated spirit, applied with a piece of wash leather and removed with a damp sponge. E. J. Wall recommends smearing black enamel paper with glycerin and squeegeeing the paper upon the back of the negative. The object of the backing is, of course, the prevention of halation, and the precaution is valued, in all cases,

indoors or out, where the subject presents violent contrasts of light and shade.

The successful use of "orthochromatic" plates has greatly increased the interest in the study of approximated color values in the photographic image. The orthochromatic plate is designed to overcome wholly or in part the difficulty brought about by the varying degrees of actinism in colors that the camera is called upon to interpret. That blue, which is intensely actinic, and yellow and red, which are relatively non-actinic, should be rendered by the negative in exaggerated contrast has been a serious drawback in the photographic image. A plate having an increased sensitiveness to yellow and red and a decreased sensitiveness to blue makes it possible to translate nature more fairly. In the copying of paintings the ordinary plate gives the blue sky as white, and objects in the rich red and orange tones lose most of their modeling. A plate giving better gradations of color is proving of great usefulness, especially as the photographic negative is the basis of so large a number of reproductive processes. For portraiture these plates have been serviceable by reason of the fact that they do not exaggerate freckles or other facial blemishes, and give better tone values to brown and reddish hair as well as to the eyes. Schumann gives the following formula for preparing orthochromatic dry plates with a cyanine bath: Soak the plate in 200 c. c. of water and 2 to 4 c. c. of stronger ammonia for two or three minutes; then immerse in distilled water, 200 c. c.; alcohol, 10 c. c.; stronger ammonia (0.9), 4 c. c. alcohol solution of cyanine (1 in 500), 10 c. c.

Ives's chlorophyll and eosin process for orthochromatic dry plates is this: Use any good bromide collodion emulsion that contains no free nitrate of silver. Flow plate as usual, and as soon as the emulsion film sets flow several times with strong alcoholic solution of chlorophyll from blue myrtle or plantain leaves; then immerse in water strongly tinted with blue shade eosin, and keep in motion until smooth. This sensitizes for all colors. A very light yellow screen is sufficient to secure correct rendering of color values.

Photography in Color.—No movements or speculations in photography have excited greater interest than those related to the search for the photograph in color. At frequent intervals during a long period the announcement has been made that this philosopher's stone of the photographic science was at last found. The repeated disappointments have evoked a natural skepticism in many quarters, but each new announcement excites fresh hope that the dream is to be realized. All the early workers sought to catch the colors of nature. Sir John Herschel claimed to have seized a faint colored image of the solar spectrum. Becquerel, who introduced chlorophyll in 1874, produced on metal plates faint images of certain colors. But even these soon faded. Niepce de St. Victor's colored prints quickly faded in daylight. In general the experiments, early and late, have moved upon two lines, one looking to a single positive image in color, the other seeking to produce a positive image in color by the agency of one or more negatives. Collen sought to superpose red, yellow, and blue prints taken from negatives made by

yellow and blue, red and blue, and yellow and red light. Duhauron, who asked for a patent as early as 1868, sought to improve on Collen's plan by the use of color screens to filter the color rays. But the inventor in despair admitted that "the production of good results will . . . involve the manufacture of compounds that have not yet been created." Poirée suggested a different negative for each spectrum color, and Dr. Vogel, in 1885, a modification that was extremely complicated. Dr. Stolze, denying the theory that all colors are based on three primary or principal colors, argued that if three suitable selective color screens were used in connection with color sensitive plates three negatives of the spectrum might be obtained, from which prints in cyan blue, carmine, and yellow, if superposed, would reproduce the color effect of the spectrum. In 1888 Frederick E. Ives, of Philadelphia, taking up Stolze's comparatively indefinite theory, demonstrated a procedure based upon the assumption that, although there are more than three or five or seven primary spectrum colors, all of them can be counterfeited to the eye by three type colors and mixtures of these three type colors. Mr. Ives proved his process by photographing the spectrum itself, employing compound color screens carefully adjusted to secure definite intensity curves in the spectrum negatives, so that they would make color prints that counterfeited the color effect of the spectrum when superposed. Shortly afterward Mr. Ives set forth a new principle, that of making sets of negatives by the action of light rays in proportion as they excite primary-color sensations, and images or prints from such negatives with colors that represent primary-color sensations. Mr. Ives's proposition included the statement that while the spectrum is not made up of three kinds of color rays and mixtures of these, the eye is only capable of three primary-color sensations. Ives claimed to produce the colors of nature in permanent prints from three negatives, or by composite heliochromy. By the use of a combination lantern the colors could be associated in a screen picture of remarkable fidelity to nature. In a statement to the Franklin Institute in June, 1891, Mr. Ives showed that by an improvement on his heliochromatic camera the three negatives could be made from one point of view by simultaneous exposure and on a single sensitive plate. The color prints were made "by a single exposure in transparent gelatin, and separated only when ready to dip into the dye solutions representing the respective color sensations." The recent studies of Carey Lea, of Philadelphia, have been regarded by many as indicating a solution of the problem. Mr. Lea has sought to apply the protochlorides of silver in the form of an emulsion, and the products of his experiments have excited much admiration. In 1890 Franz Veresetz exhibited at Vienna certain glass diapositives and paper prints. The pictures on glass were described as showing "a beautiful ruby-red ground color, with a picture in bright pigments ranging from a deep hue of red to light orange, and from violet to blue. The same colors prevail on the paper positive." But Veresetz is said to have been unable to produce green. The pictures "bore the test of light less intense than the direct rays of the sun."

One of the most sensational announcements of recent times was that made by Prof. Lippmann to the Paris Academy of Sciences in February, 1891, concerning photography in color. The announcement, as communicated by some of the newspaper correspondents, would have made the world believe that Prof. Lippmann had secured a photograph in colors "as vivid as any object in nature." But, speaking of the colors in "Le Moniteur de la Photographie," M. Léon Vidal says: "We only saw them rendered very imperfectly, and certainly we should never have suspected, if we had not been told of it, that it was a reproduction of the solar spectrum with the colors." The experiment represented by Prof. Lippmann's plate is based on the wave theory of light. Since the length of these waves determines the color sensation, Prof. Lippmann seeks, by the action of "crossed" light and "interference," to secure a deposit of silver in layers of a thickness influenced by the wave lengths of the light. The theory of the experiment is thus explained: "The conditions said to be essential to photography in colors are: (1) a sensitive film showing no grain; (2) a reflecting surface at the back of this film. Albumen, collodion, and gelatin films, sensitized with iodide or bromide of silver and devoid of grain when microscopically examined, have been employed. Films so prepared have been placed in a hollow dark slide containing mercury. The mercury thus forms a reflecting layer in contact with the sensitive film. The exposure, development, and fixing of the film are done in the ordinary manner; but when the operations are completed the colors of the spectrum become visible. The theory of the experiment is that the incident light interferes with the light reflected by the mercury; consequently, a series of fringes is formed in the sensitive film, and silver is deposited at places of maximum luminosity of those fringes. The thickness of the film is deposited according to the deposits of silver into laminae whose thicknesses are equal to the interval separating two maxima of light in the fringes—that is, half of the wave length of the incident light. The laminae of metallic silver, formed at regular distances from the surface of the film, give rise to the colors seen when the plate is developed and dried. Evidence of this is found in the fact that the proofs obtained are positive when viewed by reflected and negative when viewed by transmitted light—that is, each color is represented by its complementary color." Lippmann's theory has been severely criticised by Stolze and others, but it is very generally admitted that Lippmann, without having produced a satisfactory image in color, or one in itself materially superior to the image, produced by Becquerel, has entered a path that may lead to important discoveries.

Developers.—Theories of the latent image and of the nature of the action that takes place in development have received little modification or enhanced clearness from recent discussion, but new developing agents succeed each other with great rapidity. Hydrochinon and eikonogen were followed by pyrocatechin, which met with little favor. German operators recommended formaldehyde as an addition to the emulsion and to the developer. Oil of turpentine was sug-

gested for the same use. Crystallol was also advised. The most recent developer, para-aminodiphenol, is a powerful agent, of which much is expected; but it is too early to say much of its practical availability.

Printing Processes.—Recent movements in printing processes show a marked desire to break away from the familiar albumen print. Objections to the albumen print are based upon its color, its surface, and the limitations of the toning system. A large number of new processes present unglazed surfaces. The platinotype process has been widely followed. This process combines with a variety of possible tones a delicacy in detail not frequently given in processes based on an unglazed surface. A process using metallic silver in place of metallic platinum appears with the name "kallitype." This process, in which Dr. Nicol has acted upon the suggestions of Herschel and of Hunt, is thus described: Paper is coated with a solution of ferric citrate, ferric tartrate, or ferric oxalate, or mixtures of all or any of them, and is dried. It is then exposed behind a negative until a faint image is formed, as in platinotype, and the image is developed by treating it with a solution containing 10 per cent. of sodium citrate, 1 per cent. of silver nitrate, and sufficient ammonia to keep the silver in solution. After development the print is immersed in a 20-per-cent. solution of alkaline tartrate or citrate, made strongly alkaline with ammonia, and afterward in two successive baths of a dilute solution of sodium citrate containing free ammonia. The alkaline tartrate or citrate removes the iron compounds, while the ammonia removes the silver compounds, and finally the print is washed in water. A new kallitype process published by Dr. Nicol, and called Kallitype No. 2, coats the paper with a solution containing ferric oxalate, ferric nitrate, silver oxalate, silver nitrate, and oxalic and nitric acids. The paper is exposed until the densest parts of the negative are very faintly indicated, the appearance of the image being very much the same as in the platinotype. For black prints the exposed paper is immersed in a solution containing 10 per cent. of Rochelle salt and 10 per cent. of borax; for purple prints, in 10 per cent. of Rochelle salt and 2 to 5 per cent. of borax; for sepia prints, 5 per cent. of Rochelle salt, 1.25 per cent. of borax, and a small quantity of hydrochloric acid. In each case a small quantity of a dilute solution of potassium dichromate must be added.

Dr. Adolph Freer's "freer type" is based on the fact that diazo compounds in contact with acid sulphites form diazo-sulphonic compounds, and these form no coloring matter. If, therefore, a diazo-sulphonic compound is mixed with an equivalent quantity of a phenol or an amine, no coloring matter is formed. But if the mixture is exposed to light, the diazo-sulphonic compound is decomposed, the diazo compound is set free, and, since a phenol or amine is already present, a coloring matter is formed as fast as the diazo compound is liberated. A few seconds produces a print in daylight, and gaslight may be used.

A recent English patent gives the "primuline process." Primuline is described as a yellow coloring matter containing sulphur. This pro-

cess, applicable to fabrics as well as to paper, is another form of the diazo-type process.

Prof. Newton recently offered a formula for toning without gold, substituting nitrate of lead. The chloride of silver gelatin emulsion paper, first made by Obernetter, has become very popular by reason of the success with which it preserves delicate detail and facilitates printing from thin negatives. The carbon or anotype printing process appears in many new formulas. It is based on the insolubility of gelatin and an alkaline bichromate after the action of light. The color of the image depends on the pigment employed. The great value of carbon is in its remarkable permanency.

Rapid Photography.—The net gain in the rapidity of photographic action within the past few years is not very great, but there have been many useful and interesting advances in methods of employing highly sensitive surfaces. The experiments of Edward Muybridge in photographing animal motion, and the later experiments of Anschütz and others, have opened a broad field of speculation and experiment in movements looking to the use of the tachyscope or similar devices for throwing rapidly successive photographs upon the screen. The suggestions of Edison and others as to the possible co-operation of the phonograph and lantern apparatus in transmitting to later generations both the gestures and the voice of a speaker have been based on proved conditions and possibilities. The number of photographic images necessary to the perfection of this scheme would imply an elaboration of apparatus and a duplication of surface sufficiently great to render the experiment exceedingly costly. Such a partnership would imply some automatic union between the two apparatus at the time the impressions were received, and the re-establishment of the same automatic union at the time sound and image were exhibited.

Shutters or Exposers.—The growth of rapid photography is reflected in the enlarging number of camera shutters. The simple "drop-shutter" form has been greatly and ingeniously amplified. The disk shutter is widely used in portable cameras, as well as in pneumatic adjustable forms. There is much debate on the most desirable shape of opening in transit shutters. Many openings are made adjustable that the exposure may conform to the conditions of the exposure. Combination shutters, working with both drop and flap or with crossing disks, are a feature of recent inventions. One device presents an exposor opening in the center, enlarging to the size of the lens, and closing to the center. This, in many respects, admirable form has the objection of giving the center of the plate the greatest amount of exposure—a tendency already fostered by the natural action of the lens. An effort to secure the exposure from the rim of the lens toward the center is reported. The structural difficulties of such a movement are obvious.

Artificial Light.—The use of magnesium in producing artificial light has been of great service to photography. When properly used this form of illumination has distinct advantages over other forms. The "flash light" has greatly popularized social photography in the drawing-room and at public gatherings, as well as in

scientific and commercial channels. With the flash light mines, caverns, and tunneled districts are profitably explored. The flash pistol or lamp has accompanied the police detective into the opium den and the health officer into the corrupting haunts of the tenement. It is reported that at a gathering of civic and military dignitaries on the occasion of the ninetyeth birthday of the late Field-marshal Von Moltke, Emperor William ordered a series of flash-light pictures to be taken. The resulting negatives were to be used in historical paintings. Numerous incidents of the kind illustrate the serviceable character of this artificial illumination. The value of the magnesium light in portrait photography is now well established.

Capt. Abney announces that magnesium burned in oxygen produces a light 12 times as brilliant as magnesium burned in air. E. J. Humphrey has burned magnesium wire in an oxygen flask and, swinging the flask on the end of a wire or string, softened the edges of the shadows. A platinotype print was made by this light in 55 seconds.

Astronomical Photography.—The progress of this important department of photography has been suggested from time to time in the article *ASTRONOMY*. The partnership of the camera and the telescope has immensely enlarged the scope of astronomical research. The orthochromatic plate has begun to play a part in the survey of the heavens. Since 1887 the astronomers of the world have been carrying out the proposition of Dr. Gill, at the International Congress in Paris, to make a complete photographic map of the heavens. The task of photographing over 20,000,000 stars was divided among those observatories in different parts of the world which are suited by position and equipment for taking up such work. Ordinary telescopes, which bring to a focus the visual rays, are not suitable for photographic work. The superb Lick telescope, which has played an important part in the enterprise just cited, is provided with lenses facilitating the application of the camera. As Jerome Harrison remarks: "The great advantage of the sensitive plate over the eye in astronomical photography is that the impressions produced upon it by light are cumulative. The eye sees no farther into space after gazing for ten minutes than it did in the first minute; but the effect of the light upon the plate in such a case is 10 times as great." Thus this cumulative action of light on the sensitive plate reveals stars and nebulae never detected by the eye, even with the aid of the most powerful telescopes. It has been estimated that an exposure of one hour and twenty minutes can reveal in the negative 400,000,000 stars. Brilliant photographs of the moon are now made in a fraction of a second. An extremely small fraction of a second is sufficient in photographing the sun. Prof. Young estimates the number of photographs of the transit of Venus in 1874 and in 1882 at not less than 5,000. Each succeeding transit is recorded by a greatly increased number of photographic images.

In Other Sciences.—Medical science acknowledges a very considerable debt to modern photography. Recent experiments with the aid of the photographic medium include studies of the

throat and eyes that have communicated significant data. Some recent pictures of the larynx are valuably complete. The image is secured by the aid of electric illumination. From the physiological laboratories are reported efforts to secure photographic records of nervous and muscular action. In the preservation of pathological records in general the camera is of great utility. Photo-microscopy is in extensive operation in many of the sciences. Mining, mineralogy, surveying, and exploration all utilize photographic aid. The photographic corps has become an essential element of the modern army, occupying close relations with the balloon service. Historical events of every description are now photographed *in extenso*. Societies of amateurs, in some recent instances, have secured the co-operation of civil authorities in enabling them to record all events necessary to the completeness of local historical records.

Photo-mechanical Processes.—The revolution in the reproductive arts is one of the results of photographic advancement. Newspaper, magazine, and book illustration have wholly changed in character. There is much competition in the effort to secure a "half-tone" plate direct from the photograph, which may be conveniently printed with type. There has been a rapid advance in this method, which is largely used in illustration of all classes. But in printing qualities no half-tone plate mechanically produced has yet equaled the engraved block, being deficient in depth and in the modifications of surface which the engraver can impart. The faithfulness of the photo-mechanical plate, however, is beginning to be widely prized among artists, who formerly resented any agency but that of engraving, but who now find the improved "process" plate to be possessed of distinct advantages over any but the best engraving. Other photogravure processes have reached a high state of perfection, permitting the printing from plates having all the characteristics of the original photographic plate. Gelatin is playing a prominent part in most of these methods. Several processes use the surface of the negative itself, utilizing the hint offered by the species of relief produced in photographic action.

PHYSICS, PROGRESS OF, IN 1891.
Constitution of Matter. *The Ether.*—Prof. Nipher, in an address before the physical section of the American Association for the Advancement of Science (1891), gives a comprehensive review of the history of this subject. Prof. Lodge, in a British Association address, describes his experiments on the disturbance of the ether in the neighborhood of a rapidly moving body. Arago found no such disturbance, and Lodge's experiments, conducted on a different line, confirm this result. He caused light to fall on a feebly silvered glass plate, so that part was transmitted and part reflected. The rays thus separated were caused to pass in opposite directions between two coaxial steel disks, and then made to interfere. The effect was the same whether the disks were still or rotating rapidly. I. Whiteher ("Electrician," May 8) suggests that many difficulties in our conception of the ether are removed if we regard it not as passive and acted on by external forces, but as a continually

agitated source of energy. He concludes that the most agitated ether is the best insulator of energy, and the quietest is the best disperser.

Molecular Distances.—P. Jacobin (Paris Academy of Sciences, Jan. 12) concludes that all the physical properties of metals of the same group depend exclusively on molecular distance. For instance, for ordinary metals electric conductivity is proportional to the sixth power of the number of molecules in a given volume; for magnetic metals it is inversely as the sixth power of their distance apart.

Mechanics. *Gravity.*—Prof. J. H. Poynting (London Royal Society, June 4) has measured the earth's density and the gravitation constant by a common balance having a beam 123 centimetres long. Two spheres of lead or antimony, weighing 21 kilogrammes each, were so suspended from the arms that their centers were about 30 centimetres above the center of a mass of the same metal weighing 153 kilogrammes. This mass, being placed on a turn-table, could be shifted so as to be directly under either arm of the balance. With the aid of very delicate adjustments and careful precautions the gravitation constant was found to be $\frac{6.6984}{10^8}$ and the earth's mean density 5.4934.

Specific Gravity.—W. J. Sollas ("Nature," Feb. 26) finds the specific gravity of any minute object, such as a butterfly's wing-scale or a drop of blood, by means of a glass tube filled with a heavy fluid diluted with another which does not perfectly mix with it. After standing, the mixed fluid is found to increase continuously in density from above downward, and therefore specks placed in it show their specific gravity by the level at which they float. The instrument is graduated by small floating fragments of mica or minute glass bubbles.

Hardness.—Prof. Auerbach, of Jena ("Reperitorium für Physik"), measures the hardness of a transparent body by pressing upward against a plate of it the spherical surface of a lens by means of a weighted lever. The effect is observed microscopically. He finds that hardness increases with elasticity, but less rapidly.

Flexure.—C. A. Carus-Wilson, (London Physical Society, June 26) has studied the flexure of glass beams by means of the polariscope. The strains thus observed in a loaded beam differ from those usually assumed. The "neutral axis," instead of coinciding with the axis of the beam, is raised in the center, and its shape depends on the load and the span.

Impact.—Prof. P. G. Tait (Edinburgh Royal Society, Jan. 5) finds that solids can be divided into two classes, in one of which the duration of impact remains constant, whatever the distortion, up to a certain limit; beyond this the duration is shorter as the distortion increases. In the other class the duration first increases with the distortion, then becomes constant, and finally diminishes. Vulcanized caoutchouc is a type of the former class, cork of the latter.

Rotation.—K. Prytz ("Annalen der Physik und Chemie" vii, 1891) measures the time of rapid rotation by means of a falling body on which the rotating body spurts a fine jet of coloring matter, thus avoiding the frictional retardation of the tuning-fork method. He

claims to have measured the time of a revolution to within .0002 of a second.

Force and Determinism.—An interesting discussion in "Nature," participated in by C. Lloyd Morgan, E. T. Dixon, and others, was called forth by a statement of Prof. Oliver J. Lodge that no energy is expended in changing the direction of a body's motion, and by his suggestion that the explanation of the control of matter by mind is to be found in some such direction.

Pressure.—L. Cailletet (Paris Academy of Sciences, April 13) describes the huge manometer which has been constructed at the Eiffel Tower. It is more than 900 feet long, and can measure, by the simple weight of its liquid column, a pressure of 400 atmospheres. The tube is of steel, but at distances of 3 metres stop-cocks connect with glass tubes 3 metres long, enabling the exact height of the column to be read off when desired.

Liquids. Solution.—The battle between the adherents of the rival theories of solution ("Annual Cyclopædia," 1890, p. 711) still goes on. James Walker, in a review of the situation ("Philosophical Magazine," October), concludes that the hydrate theory is no longer a serious rival of the osmotic, the list of whose achievements is constantly increasing. Sidney Lupton (ibid., May) examines the methods of Mendeleef, S. U. Pickering, and other advocates of the hydrate theory, and asserts that though the accuracy of these methods is great, it is not so great as to warrant their conclusions. He objects particularly to the method of drawing graphic curves by laths or flexible rulers. Prof. Pickering defends his methods and results in the issue for July, and E. H. Hayes justifies the "lath" method by an elaborate mathematical investigation. Prof. Orme Masson, at the January meeting of the Australasian Association for the Advancement of Science, read a notable paper in extension of the osmotic or gaseous theory. If a solid be heated in a vacuum it first vaporizes, then melts, the liquid continues to vaporize, and finally above the critical point vapor and liquid become homogeneous. So it is, says Prof. Masson, with a solid and a pure solvent. First the solid begins to dissolve, then it melts, and the liquid continues to dissolve; finally, at a certain temperature, the liquid and its solvent become homogeneous. This analogy, he claims, is borne out by facts. His final conclusion is that in every system of solution that starts with a solid and a simple solvent, the solid has a "solution melting-point" lower than its true melting point. Above this two liquid layers exist, each having some of the other in solution. These become homogeneous at a temperature depending on the ratio of the original ingredients. One ratio demands a higher temperature than any other, and this is the "critical solution temperature," above which either ingredient is infinitely soluble in the other. Prof. Ramsay (London Royal Society, March 5) extends these ideas still further. Masson considers only isobaric curves. If isothermal curves be considered, perhaps, on increasing concentration by eliminating one solvent, the other would not separate visibly, but the two would remain mixed till one had been entirely removed. In "Nature" (March

26) Prof. S. U. Pickering criticises Masson's views, and concludes that the existence of a "critical solution temperature" should follow also from the hydrate theory. He objects especially to the word "pressure" as used by the osmotists. Messrs. Wanklyn, Johnstone, and Cooper ("Philosophical Magazine," November) hold that true physical solution includes only cases where there is no change of volume, such as that of sugar and water, and that where there is a change of volume, however slight, there is always chemical action. Carl Barus, of the United States Geological Survey ("American Journal of Science," February), discusses the solution of glass by pure hot water. The solubility is very great at 185° C., and up to this point a mixture of glass and water shrinks by solution more than 11 per cent. The effect of solution is to increase the compressibility. He thinks the solubility of glass is due to the instability of the glass molecule, and concludes that, in many instances, a definite dissociation temperature of the solid must be surpassed before solution sets in. In the same journal (November) Dr. Barus describes similar experiments on vulcanite, which, he thinks, prove that it acts in the same way. This substance has not heretofore been dissolved so perfectly that it could be regained in a solid form, but Dr. Barus has so dissolved it in carbon dioxide, chloroform, the paraffine series, aniline, benzol, and some of the ethers. Vulcanite newly deposited from solution shows curious phenomena of slow elasticity. A stretched thread shortens again very slowly and a twisted thread squirms about like a worm for several minutes. Dr. Barus thinks, however, that the thin solutions of vulcanite are not true solutions, for in sealed vessels they become gelatinous in time. Hofmeister ("Archiv für Experimentale Pathologie") has investigated the swelling of gelatin in solutions. In pure water the effect is less than when some salt is present. He considers the forces involved to be similar to those shown in the absorption of gases by liquids and solids.

Osmosis.—Boltzmann ("Journal of the Chemical Society," April) has investigated osmotic pressure mathematically from the standpoint of the kinetic theory of gases. He finds that the osmotic pressure equals the gaseous pressure that the dissolved substance would exert if it were distributed as a gas through a volume equal to that occupied by the solvent. He assumes that the mean kinetic energy of the dissolved molecule equals that of the gas molecule at the same temperature. Nernst (Berlin Chemical "Berichte," November, 1890) points out that a layer of water between two layers of benzol dissolved in ether acts precisely like a membrane. Ether will dissolve in water, but benzol will not; so, if the two solutions are of unequal strength, osmosis of the ether will take place till they are equally strong.

Capillarity.—Experiments similar to those of Lord Rayleigh ("Annual Cyclopædia," 1890, p. 711) have been made by Miss Agnes Pockels ("Nature," March 12). She finds that if a strongly contaminated liquid surface be gradually extended, the surface tension at first varies, but finally becomes constant. She calls the former state the "anomalous" and the latter the "normal" condition of the surface. Every solid

body, however clean, contaminates a water surface. Relative contamination may be measured by decreasing the contaminated water surface till it becomes anomalous, and then taking the ratio of its area to the original area.

With equal relative contamination by the same substance, there is no current from one surface to another, but there is always a current from the greater to the less contamination. With different substances there is a current, even if the relative contaminations are equal. For instance, a current flows from a glass-contaminated to a metal-contaminated surface. She concludes that water dissolves even glass and metals at its surface, and that the surface layer can take up more than the internal liquid. (See *Solution*, above.) G. Van der Mensbrugghe (Brussels Royal Academy of Sciences, April 4) concludes that the common surface of two liquids that act on one another is subject to a force whose direction is away from the center of curvature. A case in point is the slow diminution of tension between oil and water, probably due to chemical action.

Crystallization.—Prof. Tito Martini, of Venice ("Rivista Scientifico-Industriale," June), has investigated the crystallization of thin liquid films. With a solution of sodium sulphate near its saturation point films can be formed as with a soap solution. If one of these be evaporated rapidly, a lattice-work of minute crystals will remain. These finally effloresce and fall apart. Crystal films 36 millimetres in diameter were thus formed, and the experiment succeeded also with ammonium chloride and sodium hyposulphite. Lehmann, who has already noted that the optical behavior of certain liquids suggests a crystalline structure, now ("Journal of the Chemical Society," March) raises the question whether isotropic liquids are non-crystalline or crystalline and isometric. He concludes that they are non-crystalline, in view of the free miscibility of liquids. The same experimenter shows that crystals melted between glass plates retain on cooling and recrystallization the former direction of their optic axes. This may be due to a non-melted layer that adheres to the glass.

Explosive Waves.—Berthelot (Berlin Chemical "Berichte," April) shows that the speed of these is not so regular in liquids as in gases. Methyl nitrate in a steel tube explodes at the rate of about 2,100 metres per second.

Evaporation.—P. de Heen (Brussels Academy of Sciences, January 20) concludes that the velocity of evaporation at the boiling point is proportional to the square root of the velocity of the superficial gas current, and that for a given velocity the quantity vaporized is as the vapor tension.

Gases. Compressibility.—Ulysse Lala (Paris Academy of Sciences, Dec. 1, 1890) announces that, between the pressures of 100 and 1,613 centimetres of mercury, the compressibility of a mixture of air and carbon dioxide (when the per cent. of dioxide does not exceed 22) is between the compressibilities of the two gases. It increases in a mixture richer in dioxide. Later (Feb. 23) he announces that the compressibility of a mixture of air and from 16 to 31 per cent. of hydrogen lies (for pressures near 100 centimetres of mercury) between these of the two gases, but with larger proportions of hydrogen

and higher pressures the mixture becomes less compressible than hydrogen itself. E. H. Amagat (ibid. Dec. 8, 1890) has studied the compression and expansion of liquids and gases by a new method. He finds that between 0° and 200° C. and between 100 and 1,000 atmospheres the coefficient of expansion of hydrogen at constant pressure diminishes with increase of pressure. With oxygen, nitrogen, and air the coefficient is a maximum at the beginning. At constant volume $\frac{dp}{dt}$ is always greater from 0° to 100° than from 100° to 200°. The following results are for temperatures between 0° and 100° and a pressure of 500 atmospheres:

Oxygen.....	3.698	Nitrogen.....	2.971
Air.....	8.485	Hydrogen.....	1.895

Combustion under Pressure.—R. W. Wood ("American Journal of Science," June) finds that a burning jet of coal-gas is extinguished at a pressure of 23 centimetres of mercury; that is, when the velocity of the issuing gas exceeds the speed of combination for a mixture of gas and air.

Pneumatic Bridge.—This device, the invention of W. H. Shaw (London Physical Society, May 9), measures the pneumatic resistance of various orifices and changels as Wheatstone's bridge measures electrical resistance. Two arms of the bridge consist of circular holes in thin mica plates; the third arm is an aperture with a sliding shutter regulated by a screw; and the fourth is the aperture to be measured. The battery is replaced by a Bunsen burner and the galvanometer by a glass tube with a sensitive vane. By means of this apparatus it has been proved that beveling off one side of a hole in a thin plate increases its pneumatic conductivity, especially when the beveling is on the side of egress. For square-ended tubes the conductivity first increases with length and then diminishes, but a beveled mouthpiece causes this effect to disappear.

Sound. Rotation of a Vibrating Body.—If a cylindrical vibrating rod be rotated on its axis, the plane of vibration does not turn with it but remains fixed in space. But in the case of a tuning-fork the beats heard indicate that the planes turn with the fork. G. H. Bryan (Cambridge Philosophical Society, Nov. 24, 1890) shows that when a bell or other body symmetrical about an axis thus vibrates, the effect is intermediate. The nodes rotate, but with a smaller velocity than that of the body.

Intensity of Sound.—C. K. Wead ("American Journal of Science," March) notes that not the amount of energy in a vibrating body but the rate at which it is given up to the air determines the intensity. Text-books, he asserts, therefore err in stating that loudness varies with the square of the amplitude. In the same magazine for July Mr. Wead shows that no conclusions can be drawn from the loudness of the sound of organ pipes, as to the relative amplitude of vibration within. The soft Dulcinea stop takes more than half as much wind as the loud trumpet. This shows the higher efficiency of reed stops. In different pipes belonging to the same stop the consumption of wind does not at all agree with theory. For example, any note should take only

half as much wind as the one just an octave below it, but it actually requires more than this proportion. An organ pipe has 1,000 to 6,000 times the energy of a tuning-fork. One millionth of a horse-power would maintain a fork in ordinary vibration, and one tenth would enable it to be heard 200 feet.

Timbre.—Prof. Voight (Göttingen Royal Society, May, 1890) has endeavored to reconcile the results of Helmholtz and Koenig. (See "Annual Cyclopædia," 1890, pp. 712, 713).

Phonautography.—Dr. Pringsheim, of Berlin ("Naturwissenschaftliche Rundschau"), has attempted to settle by physical means the long-vexed question of the position of the French accent. Two-syllabled words were spoken by Frenchmen into a Koenig-Scott phonautograph, and the resulting curves were compared with a parallel tuning-fork curve. The result proved that the vowels were of equal length and strength, though this varied slightly with the position of the word in the sentence.

Heat. Mechanical Equivalent.—This has been redetermined by Constantin Miculesco (Paris Academy of Sciences, June 8) by a method similar to Joule's—the production of heat in a calorimeter by friction. In Joule's experiments the total work done was small, hence the determination took a long time, and various difficult corrections had to be made. Miculesco used a 1-horse-power electro-motor to supply the work, and a cylindrical calorimeter whose axis was co-incident with that of the motor shaft. The mean of 31 accordant measurements gave 426.7 kilogrammetres as the mechanical equivalent of a calorie, or, in English units, $J = 777.7$.

Specific Heat.—Prof. Pfaundler (Vienna "Berichte," April 9), in determining specific heats by Joule's law, obviates difference of conductivity through the liquid by using glass spirals filled with mercury placed in a Wheatstone's bridge, to control the ratio of resistance during the flowing of the current. Prof. W. Ramsay and E. P. Perman (London Royal Society), in experiments on the specific heat of ether, conclude that, either at constant volume or at constant pressure, it decreases to a limiting value as the temperature rises, and then increases; and that the smaller the volume the more rapid the change.

Fusion and Solidification.—Person concluded that the heat of fusion of all bodies becomes *nil* at -160° . But Prof. S. U. Pickering (London Royal Society Dec. 11, 1890) notes that Person determined heat capacities in the liquid and solid state at any convenient temperature, whereas they depend largely on the temperature. Pickering finds the temperatures of recrystallization of four substances as follow, thus disproving Person's law:

Sulphuric acid.....	-369°
Monohydrated sulphuric acid.....	-177°
Hydrated calcium nitrate.....	-234°
Naphthalene.....	-214°

In examining benzine it was found that the heat capacity of the solid was greater than that of the liquid. This phenomenon is due probably to incipient fusion below the temperature of true fusion. Carl Barus ("American Journal of Science," August) discards optical and other methods for obtaining fusion points, and employs

volume changes as his criteria. He concludes that if, under proper thermometric conditions, pressure alone can solidify a liquid, it can also, under proper solutational conditions, induce crystallization or deposition of the dissolved solid. R. W. Wood, Jr. ("American Journal of Science," January), found, on compressing ice by a pressure of $4\frac{1}{2}$ atmospheres, that a small cylinder of clear ice spurted from an aperture, as in former similar experiments. In a vessel with no aperture ice was subjected to a pressure of 20 tons to the square inch without liquefying it, as proved by the position of leaden bullets in the mass. Fine jets of spray, however, issued in all directions. He therefore questions any theory that supposes a glacier to float, as it were, on a layer of pressure-water.

Recalcescence ("Annual Cyclopædia," 1889, p. 694).—F. J. Smith ("Philosophical Magazine," May) describes some new methods of investigating recalcescence points in steel and iron. His experiments show that the change of form in the metal occurs simultaneously with its change of temperature. By fastening the wire under observation to a sort of mechanical telephone with mica disk, a sharp, crackling sound was heard at the recalcescence points. Placing the wire in a magnetic field did not affect any of the results.

Thermal Properties of Hard Rubber.—This substance has been known for some time to possess a large co-efficient of expansion and remarkable diathermanity. Prof. A. M. Mayer ("American Journal of Science," January) has investigated both properties minutely. He finds that between 0° and 18° C. the linear expansion coefficient is .0000636, and that the cubical expansion formula is $V_t = V_0(1 + .000182t + .00000025t^2)$. A plate $\frac{1}{4}$ millimetre thick transmits 32 per cent. of the incident heat from a Locatelli lamp, and 24 per cent. of solar heat. The index of refraction is 1.568—nearly as great as that of flint glass.

Very Low Temperatures.—Prof. Pictet, of Geneva, has established at Berlin what he calls a "*laboratoire à basses températures*," where special refrigerating machinery keeps objects for any length of time at any desired temperature between -20° and -200° C. The purpose of the laboratory is commercial, and it has chiefly been occupied in the purification, by crystallization, of glycerin, chloroform, ether, and alcoholic liquors, but in these processes many surprising scientific facts have already been brought to light. For instance, it has been shown that so-called "non-conducting" material does not much affect the passage of heat into a body below -100° C. In Prof. Pictet's words ("Nature," Nov. 12): "The slow oscillations of matter, which constitute the lowest degrees of heat, pass more readily through the obstruction of a so-called non-conductor than those corresponding to a higher temperature; just as the less intense undulations of the red light are better able to penetrate clouds of dust or vapor than those of blue." A covering of cotton-wool 18 inches thick has almost no appreciable effect on the rise of temperature of a substance from -135° to -100° C. It thus becomes more difficult to withdraw heat from a body the colder it gets, and Prof. Pictet judges that the lowest

attainable cold is about -255° , 18° above absolute zero. Prof. Pictet obtains his low temperatures by evaporation in three stages. First, a mixture of liquefied sulphurous acid and carbonic acid gases produces by its evaporation a temperature of -80° . At this temperature nitrous oxide can be liquefied, and this by its evaporation produces a temperature of 155° at which ordinary air is liquefiable. The liquefied air, in its turn, by its vaporization brings the temperature below -200° .

Light (For various experiments bearing on the electro-magnetic theory of light, see under "Electricity" and "Magnetism"). *Aberration*.—Loewy and Puiseux ("Comptes Rendus," March 16) conclude that there are errors in all previous determinations of the aberration constant. By a new method they find Struve's value ($20.445''$) to be very nearly true, and they also find that reflected and direct rays behave alike as to aberration.

Spectroscopy.—Michelson and Morley have found that interference bands obtained with the hydrogen α line disappear with a difference of path of 15,000 or 45,000 wave-lengths, and they therefore conclude that it is a close double, the components being separated by only $\frac{1}{100}$ of the distance of the sodium lines. Ebert denied the validity of their conclusions, and Lord Rayleigh criticised Ebert's assertions. Ebert now ("Annalen der Physik und Chemie," viii, 1891) claims to have established that the observed phenomena are not connected with duplicity but rather with the intensity of the light. G. Johnstone Stoney (Dublin Royal Society, March 18) has mathematically examined the cause of double lines in the spectra of gases. On the dynamical theory, apsidal motion (in its own plane) of the ellipse of vibration of a molecule would give rise to a pair of lines, and motion of the nodes would have the same result. Such motions may perhaps be ascribed, on the electro-magnetic theory, to the reaction of electric displacements caused by the oscillation of permanent electric charges. Hüfner and Albrecht (Wiedemann's "Annalen," March) find that the absorption of light by water is greater the longer the wave-length. But the curve of transmission is not regular, showing sudden rises in the regions of the *D* and *G* lines. Olszewski (Cracow Academy of Sciences, January) has made important observations on the spectrum of liquid oxygen. This had previously been considered colorless, but by using a layer 30 millimetres thick he found it to be a bright sky-blue. A layer 7 millimetres thick showed absorption bands in the orange-yellow; one of 12 millimetres showed three in the green and blue, and the 30-millimetres layer showed a fifth in the red (Fraunhofer's A). He concludes that the blue of the sky is due to the oxygen of the air, confirming the opinion of Egoroff and Janssen. Sir John Conroy (London Physical Society, Feb. 13) has found that the absorption spectrum of cobalt glass varies with temperature. Similar changes in solutions may be ascribed to the formation of hydrates or by partial dissociation, but neither of these explanations holds for a solid. H. Rigollot (Paris Academy of Sciences, Jan. 5), in experiments on the absorption spectrum of iodine, concludes that with an increase

of molecular weight of the solvent the absorption band is shifted to the violet end, and the minimum amount of light received diminishes in value. A. Cornu (Paris Academy of Sciences, Dec. 22) deduces from photographs of spectra by Dr. O. Simony the following facts concerning the influence of the atmosphere on the ultra-violet solar spectrum:

LOCALITY.	Altitude in meters.	Wave-length of last trace of spectrum.	Wave-length of the beginning of the end.
Teneriffe	3,700	282.2	268.7
Courtenay	170	284.8	295

Polarization.—Wiener (Wiedemann's "Annalen," xl, 203, 1890) allowed a wide beam of polarized light to fall on a reflecting surface at an angle of 45° , so that the reflected ray cuts the incident at a right angle. If there is interference here, the direction of vibration of the polarized light must be normal to the plane of polarization and perpendicular to the direction of propagation. By using a thin photographic pellicle he proves the existence of interference fringes, and his results thus support the generally received theory of polarization. Dr. Fock (Berlin "Berichte," February), assuming that the carbon molecule is tetrahedral, shows that the different effects of its apex and base on light will account for the greater strength of one circularly polarized ray in certain solutions, which is generally considered to be the cause of their power to rotate the plane of polarization of a light beam.

Phosphorescence.—E. Wiedemann (Beiblätter to Wiedemann's "Annalen," iv, 1891) concludes, from experiments on Balmain's luminous paint, that matter that emits more light than heat is not necessarily the cheapest source of light. In order to establish the contrary, account must be taken of the entire transformation of the energy of the light in the process of using it. His results are opposed to those of Langley ("Annual Cyclopaedia," 1890, p. 714). On the other hand, Prof. William Crookes, in an address before the Institution of Electrical Engineers (Nov. 13), noted that the researches of Hertz and Lodge have "unfolded to us a new and astonishing universe." The wave-lengths of electric rays are constantly being reduced by experiment, and could we construct Leyden jars of molecular dimensions, the rays might fall within the narrow limits of visibility. Prof. Crookes thinks that the phosphorescence of the rare earths by electricity may be actually an artificial production of these short electric rays, and that if it could be produced more easily and more regularly, as in the glow-worm and firefly, it would be far more economical than any light we know. Henri Becquerel (Paris Academy, March 16), using his father's well-known phosphorescope to examine the spectra of various phosphorescent minerals, finds that in chlorophane the spectrum varies with the velocity of rotation of the instrument. He concludes that this is due to the presence of different substances that form definite compounds under certain conditions of illumination and temperature. M. Becquerel has also (ibid., Nov. 9) developed formulæ for the relation between the intensities

of light emitted by phosphorescent bodies and the duration of illumination. The results agree very closely with his father's experiments.

Intensity.—Dr. A. Richardson ("Philosophical Magazine," September) has devised a new method of measuring the intensity of rays of high refrangibility. It depends on the sensitiveness of chlorine to light.

Photography.—Lord Rayleigh ("Philosophical Magazine," February) finds that a pin-hole may replace a lens under certain conditions, but to obtain the definition of a lens of four-inch aperture, a focal distance of five miles would be necessary.

Stereoscopy.—C. J. Woodward exhibited to the London Physical Society, on May 22, Dr. Schobben's lantern stereoscope. The two pictures are superposed on the screen, red glass being placed in front of one lantern lens and green in front of the other. The spectators wear spectacles with one green and one red glass. Each eye, therefore, selects its own picture, and the usual stereoscopic effect results.

Liquoscope.—M. Sonden, of Stockholm ("Nature," Sept. 17), has devised what he calls a "liquoscope" for optical comparison of transparent liquids. Two hollow prisms holding the liquids are separated by a partition at right angles to the refracting edge, and are placed in a vessel of glycerin with plane parallel glass sides. The deflection of the rays through the prisms is thus compensated. A straight mark viewed through the instrument appears as two disconnected halves, the relative displacement of which gives a measure of the difference of the refractive powers of the two liquids.

Electricity. Its Velocity.—The velocity of an electric disturbance through a wire, as found by Wheatstone, was half as great again as that found by Kirchhoff. It has been proved by I. Stefan (Vienna "Berichte," April 23) that the discrepancy is due to the fact that Wheatstone used a coiled wire. Stefan compared by Hertz's method the waves in a straight wire with those in a coil like that of Wheatstone, and found a similar difference in velocity.

Electric Waves. (See "Annual Cyclopædia," 1889, p. 694; 1890, p. 715).—Prof. Lodge ("Nature," July 16) objects to the expression "electric resonance" (used of responsiveness to electric radiation), as not conveying an exact meaning. Dr. Arthur Myers suggests "syntony" (Greek *σύντονος*), with its derivatives "syntonize" and "syntonic." "Symphonic" has also been suggested, but is objectionable, as it has already a different meaning. Prof. Lodge (London Physical Society, June 11) has yet found in insulators no trace of opacity to electro-magnetic radiation, but the thinnest film of metal is quite opaque. Even cardboard rubbed with graphite is a complete screen. He has devised what he calls a "graduated electric eye," or "harp," consisting of strips of tinfoil of different lengths, which is sensitive to a wide range of radiation. Prof. Lodge considers that the opacity of ebonite (the most conspicuous exception to the rule that insulators are transparent) is due to internal reflections, like that of ground glass. Prof. Klemencic (Vienna "Berichte," Feb. 19), in experiments on the reflection of electro-magnetic waves from plates of metal and sulphur, finds

that the results in general agree with Fresnel's formulæ for intensity, but that there are some noteworthy exceptions, probably due to the large size of the ray compared to that of the plate. F. T. Trouton ("Philosophical Magazine," July) finds that as the reflector is smaller the distance of the node becomes greater, and that the distance also varies according as the long dimension of the mirror is parallel to the magnetic or to the electric component of the wave. He considers this due to the fact that the beam rapidly decreases in intensity as it leaves the mirror. F. Von Dobrzynski claims to have photographed electro-magnetic waves in air, the time of exposure being three hours. He concludes that waves of from 0.6 to 20 centimetres in length are photographically effective. Electric waves in conductors also have been further investigated. E. Sarasin and L. de la Rive (Paris Academy of Sciences, March 31) conclude that the velocity of such waves is sensibly the same as in air. A. Elsass ("Annales de Physique," Nov. 12, 1890) detects waves on a wire in open circuit by hanging a telephone on it at successive points. The source of electricity was a single Daniell cell. Prof. Lodge (London Physical Society, June 12), in experiments on "resonant Leyden jars," the discharge of one of which precipitated that of others, "timed" wires to respond to the oscillatory discharge of the jars. When a thin wire was connected to the knob of a jar and a parallel wire was joined to the outer coating, the points of greatest vibration in the wires were plainly shown by a glow. The identity of electro-magnetic radiation with light has received new confirmation in the experiments of L. Arons and H. Reubens, who find that Maxwell's relation, $n^2 = \mu$, holds for four fluids (n being the ratio of the velocity of the wave *in vacuo* to that in the given substance, and μ being its dielectric constant). This relation is a consequence of the electro-magnetic theory of light. C. V. Boys has continued his trials to make an electric-radiation meter ("Annual Cyclopædia," 1890, p. 716). With the aid of Prof. Fitzgerald ("Philosophical Magazine," January) he showed that the heating of a wire exposed to the radiation was equal to that caused by the current from one Daniell cell through an external resistance of 115 ohms and a working resistance of 38 ohms, or about .01 of an ampère. Hertz himself ("Lumière Electrique," March 28) has studied the mechanical action of his waves, the electric force being measured by a cylinder of gilt paper, and the magnetic force of a circular ring of aluminum wire. He concludes that the magnetic and electric vibrations are at right angles, and that the nodes of each coincide with the antinodes of the other.

Photo-electricity.—Prof. G. M. Minchin (London Physical Society, Jan. 16) has explained at length the construction of his photo-electric cells ("Annual Cyclopædia," 1890, p. 717). In unsuccessful efforts to photograph distant objects, he discovered that an electric current is produced by the action of light on silver plates coated with a collodion or gelatin emulsion of a haloid silver salt, or with certain aniline dyes, when immersed in a liquid, one plate only being illuminated. The electromotive force was rarely greater than one twentieth of a volt. Uncleaned

tinfoil plates in water produced a like effect, tinfoil from tobacco packages being very sensitive. The best plates, however, were made by coating tinfoil with white oxide of tin. Alcohols were found to be the best liquids. A discussion as to these cells took place in the London Physical Society on Feb. 13. In answer to a question as to the source of their energy, Prof. Minchin replied that there is a direct transformation of the light energy without chemical change.

Electromotive Force.—A. Oberbeck and J. Edler (Wiedemann's "Annalen," xlii, 2) conclude, from experiments on the electromotive force of galvanic elements, that the force can be calculated from the heat equivalent of the chemical process, taking into consideration the local evolution of heat at the electrodes. Want of constancy they think due to taking up of molecular layers of a dilute solution of the metal of the electrode. G. J. Burch and V. H. Veley (London Royal Society, Nov. 27) have investigated the variation of the electromotive force of cells made up of certain metals with platinum and nitric acid. With copper, silver, bismuth, or mercury the electromotive force rises to a constant value, which is generally a maximum. This is due to decomposition of the acid to form nitrous acid; for if nitrous acid be added, the maximum is attained at once, and if some substance is added to neutralize the nitrous acid, the rise is extremely slow. Dr. G. Gore ("Philosophical Magazine," July) finds that great changes of voltaic energy take place during the melting of alloys, the most sudden effect being with those that exhibit the most sudden liquefaction. This fact may be used to detect physical and chemical changes in alloys.

Conductivity.—E. Brauly ("La Lumière Electrique," May 16) has studied the phenomenon of variation of conductivity in powders. It has long been known that pressure diminishes their resistance. Brauly finds that it is lessened also by a Leyden-jar discharge in the vicinity, by the proximity of a conductor traversed by a condenser discharge, and by induced currents, or continuous currents of high electromotive force, passed directly through the powdered substance. Some powders—for instance, a mixture of sulphur and aluminum—require both pressure and electric influence. In further experiments (Paris Academy of Sciences, Nov. 24) he finds that in a circuit composed of a Daniell cell, a high-resistance galvanometer, and a thin film of copper 7×2 centimetres on ground glass or ebonite, only an insignificant current passes; but if a discharge from a Wimshurst machine or a Ruhmkorff coil takes place in the neighborhood, even at a distance of several metres, there is a sudden diminution of resistance. N. G. Klassen (Cambridge Philosophical Society, Jan. 26) finds that the electric resistance of a sulphuric acid solution varies nearly with the viscosity, attaining a maximum at a dilution corresponding to the hydrate $H_2SO_4 \cdot H_2O$, but the analogy diminishes with the rise of temperature, probably on account of dissociation of the hydrate. Shelford Bidwell (London Physical Society, Dec. 6, 1890) has succeeded in utilizing the well-known sensitiveness of selenium to light in the construction of an automatic electric lamp, which lights itself at twilight or whenever the room is darkened.

Prof. W. E. Ayrton and T. Mather (*ibid.*, June 26) have devised several forms of non-inductive resistance. One consists of strips of thin sheet platinum, 6 metres by 4 centimetres, each doubled backward on itself, with silk between the two portions. Twelve of these in series had a resistance of 2.95 ohms, and would carry a current of 15 amperes without a change of more than 0.1 per cent.

Electrolysis.—Ostwald ("Journal of the Chemical Society," December, 1890) has investigated the electric properties of semi-permeable walls. This property of a wall depends on its ability to let through the separate ions of an electrolyte. If a solution whose ions can not pass be electrolyzed, the wall will act like a metallic electrode. Svante Arrhenius (Wiedemann's "Annalen," xlii, 18) reverses the methods of Van't Hoff by arguing from the electrolytic properties of a dilute solution to those of a gas. He investigates the conduction of electricity by the vapor of heated salts, and finds their behavior analogous to that of solutions of the same salts.

M. Chabry, of the French Société de Biologie, has succeeded in producing a pressure of 1,200 atmospheres by electrolytic generation of gas in a closed space. The liquid was a 25-per-cent. soda solution. Both electrodes were of iron; one was the hollow sphere in which the gas was collected, the other was an inner tube. The current had a strength of $1\frac{1}{2}$ amperes. The highest pressure previously produced by this method was 447 atmospheres (Gassiot).

Electric Evaporation.—Prof. William Crookes (London Royal Society, June 11) gives this name to the phenomenon discovered in 1877 by Prof. Arthur W. Wright, of Yale, namely, that a stream of metallic molecules passes from one electrode to another when the electric discharge passes through a vacuum, and that a metallic deposit can be made on an interposed sheet of glass. This process has been used for silvering mirrors and for obtaining thin metal films, but Prof. Crookes is the first to investigate it exhaustively. He finds that it is similar to ordinary heat evaporation, the presence of air lessening it as it lessens common evaporation, but in a greater degree. The following table shows evaporation from cadmium electrodes in 30 minutes:

CONDITIONS.	Positive pole.	Negative pole.
	Grains.	Grains.
Original weight.....	9.84	9.38
Weight at end of experiment.....	9.25	1.86
Amount volatilized.....	0.69	7.52

In a few hours 350 grains of the metal were evaporated. From silver electrodes in an hour and a half 0.01 grain and 0.19 grain were volatilized. With the purple gold-aluminum alloy discussed by Prof. Roberts-Austen, the gold evaporated first, leaving the other metal.

The comparative electric volatilities of metals, calling that of gold 100, are as follow:

Palladium.....	105	Platinum.....	44
Gold.....	100	Copper.....	40.24
Silver.....	82.63	Cadmium.....	81.99
Lead.....	75.04	Nickel.....	10.99
Tin.....	56.96	Iridium.....	10.49
Brass.....	51.88	Iron.....	5.20

The above results are for equal surfaces. The volatilities for equal weights, obtained by dividing by the specific gravities, are as follow:

Palladium.....	9	Copper.....	2.52
Silver.....	7.88	Platinum.....	2.02
Tin.....	7.76	Nickel.....	1.29
Lead.....	6.61	Iron.....	0.71
Gold.....	5.18	Iridium.....	0.47
Cadmium.....	8.72		

The order of electric volatilities does not correspond to that of melting points or of any other known constants. By the method of electric evaporation and condensation, Prof. Crookes obtained films of gold and silver that could be removed in the form of brilliant foil.

Inductive Discharge through Gases.—Prof. J. J. Thomson (London Physical Society, May 9) finds that the electric discharge in rarefied gas is greatly simplified when there are no electrodes. He passes a Leyden-jar discharge through a tube of mercury wound spirally around a gas tube, thus electrifying the latter by induction, and finds that the "dark space" and the striae are absent. The conductivity of the gas tube increases as the pressure diminishes up to a certain point and then diminishes, proving that the high resistance of a nearly perfect vacuum is not due to the presence of electrodes. A fine wire in the tube on the side opposite to the primary circuit prevents luminous discharge. These experiments lead Prof. Thomson to conclude ("Philosophical Magazine," October) that the distinction between electrostatic and electromagnetic induction is to be made only for convenience. The same phenomena that would be considered electrostatic in a tube with free ends would be called electromagnetic in an endless tube. Nikola Tesla ("Electric Engineer," New York, July 1) has made similar experiments by inserting in an ordinary incandescent lamp bulb a tube containing a roll of copper foil, through which the jar discharge is passed. He concludes that the effect is purely electrostatic. By so directing the discharge as to exalt the electrostatic effect, he produced light in a bulb several feet distant from the primary, and has shown it to be possible thus to construct an electric lamp without visible connections that will be luminous in whatever part of a room it may stand.

The Electric Arc.—According to Elihu Thompson ("Electric World," Feb. 28), this has not received the study that it merits. He thinks that the carbon is actually vaporized by the current in the arc (see also *Electric Evaporation* above), a coherent deposit being obtainable from it. In long arcs there is an outer zone of true combustion. The carbons in an electric arc light become plastic, as can be shown by taking an impression. The real work of the arc, as shown by difference of potential, is in vaporizing the carbon in the "crater" of the positive pole. Photographs by J. C. McMyynn, described by E. L. Nichols in "The Electrician" (June 5), show that the humming of an alternating current arc is similar to that of a singing flame, the arc being rapidly extinguished and relighted. They show also an oscillation of the arc from right to left, due to the influence of the earth's magnetism. In an earlier article ("American Journal of Science," January) Mr. Nichols noted that when the terminals of the secondary

coil of an alternate-current transformer are armed with a ball and a point, when the distance is such as to admit of a discharge between them, a shunt galvanometer shows a considerable continuous current from ball to point. F. C. Caldwell finds that the discharge when the ball is positive, leaves perpendicularly to the surface, and when the point is positive it leaves the apex and reaches the ball obliquely.

High-pressure Phenomena.—Recent experiments have been made in Frankfort, Germany, and in London, with alternating currents of the enormous potential of 45,000 volts. When the electrodes were placed several inches apart and a thick sheet of glass was inserted between them, the discharge appeared like a true flame, darting toward the glass and licking it with interlacing tongues of fire. As the pressure increased the flame flowed around the edges, and the glass was finally shattered.

Point Discharge.—A. P. Chattock ("Philosophical Magazine," September) says that where electrified steel needle-points are discharged in air the smooth, curved apex of the point is studied with chains of air molecules (known as "Grotthus chains") standing up like bristles. External pressure varies the length and closeness of the chains, and affects the discharge.

Electricity from Carbon Dioxide.—Dr. Haussknecht (Berlin "Berichte," May) notices interesting electric phenomena accompanying the manufacture of solid carbon dioxide on a large scale. The liquid gas is allowed to escape into sail cloth or canvas bags. In the dark these appear illuminated by a pale greenish-violet light, and sparks from 10 to 20 centimetres long dart from the cloth. The phenomena seem to be analogous to those of hydro-electricity, and to be due to the friction of the gas and spray on the pores of the cloth.

Dielectrics.—E. Bouty (Paris Academy of Sciences, April 27) finds that mica behaves as an invariable dielectric in a direction normal to the planes of cleavage. Between 0° and 300° C. the dielectric constant does not alter by $\frac{1}{10}$. It is possible that between 300° and 400° C. mica may possess some specific conductivity, but it is negligible for charges of brief duration. The large variations of mica condensers with the duration of charge he finds to be due to electrolysis of foreign bodies in the superficial layer.

Photography by Electric Spark.—Lord Rayleigh, in a lecture before the Royal Institution (Feb. 6), exhibited spark photographs of bubbles of a gas rising within a liquid and breaking the surface into spray; of jet phenomena; and of the breaking of a soap film. The success of these pictures depended on a delicate electromagnetic adjustment which determined the production of the spark at the desired moment.

Apparatus for Measurement.—Max Wien ("Annalen der Physik und Chemie," iv) uses a telephone to measure electric currents, the diaphragm being replaced by a thin metal plate, like that of an aneroid barometer, which is connected by levers to a mirror. A reflected beam of light serves as an index. C. V. Boys (London Physical Society, June 26) has devised a pocket electrometer, using his quartz fibers for suspension. The advantage of a small instrument is that it can be made 10,000 times as sensitive as a large

one. Boys's electrometer has a disk that weighs but $\frac{1}{10}$ of a gramme. W. E. Ayrton, J. Perry, and W. E. Sumpter (London Royal Society, June 4) find that the ordinary quadrant electrometer does not even approximately obey the usually assumed law when the potential of the needle is altered. This is due to electric action between the guard tube and needle and to the tilting of the needle at high potential. They have altered the construction of the instrument so as to eliminate this source of error.

Lightning and Lightning-Rods.—N. D. C. Hodges (Institute of Electrical Engineers, April 21) has noticed that in all recorded cases of lightning stroke the dissipation of a small conductor (say $\frac{1}{8}$ of an inch in diameter) has always protected surrounding objects between two horizontal planes passing through its upper and lower ends. A query inserted in "Science" weekly since June 19 had elicited no exception to this law by Jan. 1. To apply it practically Mr. Hodges has devised what he names a "lightning dispeller," consisting of a thin, easily volatilized conductor, that is intended to convert the electric energy at once into a harmless form. In opposition to his views, Prof. Elihu Thompson ("Electric World," New York, June 27) claims that this invention rests on a fallacy, since the inventor seems to suppose that overcoming the resistance of the conductor is the only work done by the flash, whereas this work is only a minute fraction of the whole amount. The practical experience of several years is necessary fully to decide on the value of the dispeller. Prof. Thompson (*ibid.*) asserts that not all lightning is oscillatory (see "Annual Cyclopædia," 1889, p. 699). A discharge that passes over a great length of cloud he says takes some time to do so.

Magnetism. Its Nature.—Prof. J. A. Ewing, by further advances in the direction noticed last year ("Annual Cyclopædia," 1890, p. 719), has thrown most important light on the molecular processes of magnetization. His theory, which is popularly set forth in a Royal Institution lecture (May 22), is an extension of the generally accepted one (Weber's), that magnetization imparts no new qualities to the molecules of a substance, but simply reveals their magnetism (which had been ineffective because their axes had all possible directions) by bringing them more and more into parallelism. Ewing represents the magnetic molecules by small magnetic needles, free to turn on pivots, and studies their behavior when they are subjected to the influence of an electric current in a surrounding copper coil. When there is no current through the coil, the magnets arrange themselves in stable groups. A feeble current turns each slightly, but all return to their original positions when it ceases. As the current grows stronger, some of the less stable groups suddenly assume new positions of equilibrium, in which their axes are more nearly parallel to the magnetizing force, and others follow, till finally with a very strong current all the groups break up and new ones are formed. A large proportion of the magnets, in this case, will not go back to their old positions when the current is stopped. A still stronger current of course alters their direction little, as they are now nearly parallel. The slow movement of the needles at first, their wavering as the point

of instability is reached, and their sudden swinging into their new positions, are very striking. Their behavior thus explains exactly why, as the external force steadily increases, the magnetization of a metal first increases slowly, then rises rapidly, and then increases slowly again, till finally a large additional force produces almost no change at all. It also explains the phenomenon of retentiveness, which on this theory seems due to the assumption by the molecules of new permanent configurations. Hysteresis (see "Annual Cyclopædia," 1889, p. 702), which Ewing defines as "the tendency of the changes of magnetism to lag behind changes in the magnetizing force," comes in, on his theory, whatever may be the cause of the change, whenever it involves such deflections of the molecules as to make them unstable. The unstable movements are not reversible with respect to the agent that produced them; that is to say, they can not be simply undone step by step as the agent is removed. The dissipation of energy attendant upon a reversal of the magnetism of iron or steel, or upon any cyclic change in it, is explained by the fact that as a molecule "tumbles," as it were, from an unstable grouping, it oscillates, till its motion is damped by the electrical eddies that it causes. The well-known effects of vibration, tapping, or strain in facilitating magnetization also follow directly from the new theory. And since the molecules of a piece of iron wire are magnets, though there be no magnetization of the wire as a whole, its physical qualities change during loading and unloading in a manner involving hysteresis. The theory also throws light on the "time lag" of magnetization, which it shows to be due to the way in which one molecular group after another breaks up. The sudden loss of magnetism when a metal becomes red-hot, Ewing suggests is due to the fact that the molecular vibration may be then so violent as to set the molecules spinning, thus masking their polarity. Arthur Hoopes ("Electrical World," New York, May 16) has drawn curves representing the magnetic susceptibility of a Ewing's model, and they correspond remarkably with those obtained for actual metals. Prof. S. P. Thompson (London Physical Society, Nov. 28, 1890), in illustrating Ewing's theory with small charm compasses, found that with small openly spaced magnets a weak external force was comparatively effective, and he thinks this may throw light on the molecular groupings of the loadstone, the crystalline variety of which has little or no magnetic susceptibility, while the heterogeneous variety has a great deal.

Magnetism and Strain.—Prof. C. G. Knott (Edinburgh Royal Society, June 1) has investigated some relations between magnetism and twist in iron, nickel, and cobalt. A rectangular rod of nickel or cobalt twists left-handedly when a current is passed along it in the direction of magnetization, while iron twists right-handedly, unless strong fields are used. He observed effects, when an apparently demagnetized wire was subjected to twist, that suggested that a magnetized wire may, in certain circumstances, consist of alternate layers of opposite polarities. From his own experiments and those of others, he concludes that the first effect of a shearing stress on molecular groupings is not only to

increase the average intensity in the direction of the magnetizing force, but also to bring into prominence a relatively high intensity in directions at right angles to it.

Distribution of Magnetism.—This has usually been tested by rods, ellipses, or spheres applied to the magnetic body, but these alter the very thing they are designed to measure. Prof. S. P. Thompson (London Physical Society, March 10) uses a flat coil and a galvanometer. His results show that the perturbations caused by the so-called "proof pieces" are very large, sometimes the perturbed field about the point of contact being from four to six times as great as the unperturbed field.

Propagation of Induced Magnetism in Iron.—To ascertain the rate at which this takes place, Fred. T. Trouton ("Nature," Nov. 12) passed an alternating current through a coil placed radially around a ring of soft iron, supposing that the interference of the magnetic waves thus produced would cause magnetic nodes in the ring. These nodes he tried to detect by a shifting coil attached to a telephone. Nodes were at once observed, but they were not due to interference, for the distance between them was unaffected by a change in the rate of alternation of the current. The effects on opposite sides of the same node, however, were of opposite phase, just as if interference had been the cause; but, notwithstanding this, the currents induced on either side of a node are not of opposite sign. Mr. Trouton concludes that the phenomenon depends on some permanent peculiarity, round the ring, that happens to occur regularly; but what this is or how it is caused is yet unknown.

Magnetism and Light.—A. B. Basset (London Royal Society, Jan. 8) has endeavored to explain Kerr's phenomenon (the rotation of the plane of polarization of a ray of polarized light by reflection from the polished end of a magnetic substance) by considerations based on the electro-magnetic theory of light. In metals the phenomenon is complicated by the difficult one of metallic reflection, but it is shown also by some non-metallic magnetic substances, such as solutions of certain chemical compounds of iron, and he devotes his attention to these. His explanation is developed mathematically from Rowland's assumption that Hall's effect (the production of a cross electromotive force by the passage of a current through a conductor in a magnetic field) holds good in a dielectric. The results agree pretty well with experiment but not entirely.

Position of Virtual Poles.—Thomas H. Blakesley (London Physical Society, Nov. 28, 1890) discusses the problem, "given the two virtual poles of a magnet and a straight line intersecting at right angles its axis produced, to determine at what point this line is parallel to the field." The mathematical solution is of scientific interest, because this point can be experimentally determined and the distance of the virtual poles can then be calculated. Blakesley's geometrical solution and his resulting formula are given in "Nature," Dec. 25, 1890.

Change of Form affecting a Magnetic Field.—Prof. A. E. Dolbear, from experiments on a flexible magnetic ring, (American Academy of Sciences, Boston, Jan. 14), comes to the following conclusions:

1. A change in the form of a magnet causes corresponding change of stress in the field.

2. Periodic changes in form due to elasticity of form, such as are called sound vibrations, set up similar periodic changes or waves in the magnetic field.

3. Such vibrations set up in other magnets similar vibrations, either sympathetic or forced.

4. These vibrations of the receiving magnet change its field, setting up electric currents in surrounding circuits.

Prof. Dolbear suggests that all atoms are magnets, so that their vibration must set up electro-magnetic ether waves. A ring magnet is the most perfect form possible, and thus Sir William Thomson's vortex atom theory at once suggests itself to the mind.

Magnetism and Electrical Oscillations.—Contrary to general belief, Prof. John Trowbridge shows ("American Journal of Sciences," September) that (1) the magnetic permeability of iron wires exercises an important influence on the decay of electric oscillations of high frequency; (2) probably the time of oscillation in iron wires may be changed; and (3) therefore a current of high frequency—a Leyden-jar discharge, for instance—magnetizes the iron.

Magnetic Force due to Steady Currents.—Dr. Schuster ("Philosophical Magazine," July) shows that this can always be expressed in terms of the value of the current at the surface of the conductor: the current within may be unknown, though, of course, it is determined by that on the surface.

The Earth's Magnetism.—Prof. F. H. Bigelow ("American Journal of Science," September) thinks that the permanent magnetism of the earth may be principally due to its orbital motion through the radiant field of sunlight. The rotation of the earth on its axis introduces a modification, and may result in a rotation of the axis of polarization about the axis of figure; or, if the magnetization has already become set in the earth, may cause a succession of secular waves to sweep over it from east to west, as shown in the history of the isogonic lines.

Diamagnetism.—J. Parker ("Philosophical Magazine," August and September) thinks that the theory of diamagnetic polarity is as absurd as it would be to claim that the ascent of a balloon is due to "diagravitation." He develops mathematically the theory that diamagnetic effects are really due to the magnetic pressure of the surrounding medium. To those objectors who assert that in this case we must ascribe magnetic qualities to a vacuum, since diamagnetic phenomena occur in an exhausted receiver, he replies that we can not obtain a perfect vacuum, and that the residual gas in the best vacuum we can get is quite sufficient to account for the observed facts.

PHYSIOLOGY. The physiological researches of the year 1891 have not been marked by any new or striking discoveries, but have indicated a steady advance all along the line. Heidenhain's work on lymph has resulted in showing that the absorption of products of digestion is not merely osmosis; that the exudation of lymph can not be explained simply as due to diffusion under pressure, but is dependent on the secretory activity of the endothelial cells in the capillary

walls. A distinction which he marks between blood lymph and tissue lymph affords a new view in contrast to that which regards all kinds of lymph as exudations of blood-plasma. The great importance of the part played by calcium salts in the processes of coagulation has been set forth by the careful researches of Ruge, Wright, and Sainsbury in England, and Arthus and Pagès in France. In the physiology of the nervous system, Ramon y Cajal and Kölliker have more fully demonstrated the non-continuity of sensory nerve fibers with nerve cells. According to their researches, nervous impulses pass by mere contact rather than through anatomically continuous channels to the cells. Nothing definite is yet advanced in regard to the true explanation of the connection between pancreatic disease or extirpation and diabetes. The pancreas appears to have other functions than that of a manufactory of pancreatic juice; and the kidney seems to have other uses than the secretion of urine, and to play some important part in the metabolic cycle.

Circulation.—The investigations of Hayercraft on the cause of the first sound of the heart-beat present results favoring the supposition that it is valvular or has a valvular element. While admitting that the contracting ventricle may produce a sound, the author maintains that it is a resonance sound. The heart-sounds appear to be higher in pitch than the sounds produced by contracting skeletal muscles, or by the muscular tissue of the pulsating but bloodless heart itself. The two heart-sounds were found to vary somewhat in pitch even in the same species, but to be always in the bass clef, and separated by a minor third, or by an impure minor third, from one another. Upon the whole question, the author concludes that the first heart-sound is "an impure musical note, a minor third below the second sound, and in the bass clef. It is a valvular sound, like the second sound. It is accompanied by resonance tones of the chest, the stethoscope, and the ear, these tones being produced by the shock of the contracting heart. In addition to this, it is of course possible that there may be concomitant sounds produced by the rushing of the blood and other minor disturbances."

It has been found by H. N. Martin that while the isolated heart of the cat may be cooled down to a temperature of 16.5°C ., and yet not be killed if soon warmed again, it usually dies at about 17° or 18°C . The cooling is accompanied by a slowing of the pulse. When the temperature is slowly and gradually raised, the lethal or maximum temperature is found to lie usually between 44.5° and 45°C . Before this is reached, an optimum temperature is passed at about 41.3°C ., at which the beat is quickest, although it may not be the temperature for doing the most work. By care it is possible to adapt the heart to higher temperatures. If the blood be cooled somewhat, as soon as the heart shows any signs of weakness the temperature may then be often raised to a still higher point without causing any weakening of the heart; and in this way we may raise both the maximum and the optimum temperatures.

From their studies on the coagulation of the blood and its dependence on calcium salts, Ar-

thus and Pagès have found that coagulation may be prevented by the addition of oxalates, fluorides, or soaps; that as this procedure may arrest an impending coagulation or interrupt one already begun, it is inferred that the salts do not prevent the formation of the ferment; that the action is due to a decalcification, or, in other words, the presence of soluble calcium compounds is essential to coagulation, and anything which removes them hinders that process. The calcium salts may be replaced by those of strontium, but not by salts of barium or magnesium; that fibrin is a calcium compound; and that the process is not a transformation of the fibrinogen into a substance capable of uniting with calcium salts to form an insoluble compound, for the coagulation is not instantaneous.

The experiments of L. E. Shore on the effect of peptone on the clotting of blood and lymph lead to results opposed to the conclusions of Fano, that, as far as the clotting power is concerned, lymph always goes hand in hand with the blood, and to his deduction from this, that the lymph is completely dependent on the blood, and produced from it by a physical diffusion. Mr. Shore records experiments in which he obtained a condition when blood clotted normally, and lymph did not.

Concerning the character of the blood-flow into the heart during diastole, H. N. Martin has found that when the aspiration of the thorax has been eliminated, the right auricle of the mammalian heart will not receive blood unless it is supplied by a decided, if small, positive pressure. Such suction-pump action as may be exerted by the heart in the closed thoracic cavity is not due directly to its active expanding force, but is the secondary result of the pneumatic conditions prevailing within the cavity. Any cause diminishing thoracic aspiration must therefore hinder the work of the heart; and it is probably more in this manner that the circulation is impeded in certain cases of hydro- or pneumo-thorax than by direct pressure exerted upon the heart itself.

Microscopical examinations by MM. Locuy and Puiseux of preparations of peritoneal serum showed the presence of red globules of blood (hæmatics), whatever precautions were taken. The globules are therefore regarded as a normal element, physiological, not accidental, of the serum. Colorless spherical lymphatic cells, having dimensions from 20μ to 100μ , are also described in the authors' paper. The volume, structure, and reactions of those cells from the three animals experimented upon (the domestic rabbit, the rat, and the cat) are found to vary.

S. Monekton Copeman gives as the methods with which he has been successful in demonstrating the formation of crystals of hæmoglobin in human blood: the addition to the blood of decomposing serum or pericardial fluid; treatment with bile; agitation with ether; semi-digestion in the stomach of the common leech—of which the first is the only one to be recommended as being invariably successful. Specimens made in this way appear to be permanent. Hoppe-Seyler has also obtained hæmochromogen in the crystalline form.

The principle of a new method of determining the velocity of the blood, demonstrated by Dr. G. N. Stewart, consists in impressing upon the blood

at any part of its course an alteration which will travel with the velocity of the blood stream, and be capable of easy recognition at any other part. Among the advantages of the method are, that it does not affect the vascular system except at one selected point; that the only substance introduced into the blood is a harmless salt, which is already present there, and is rapidly eliminated; that it admits of a rapid succession of observations on the same animal; that it lends itself to determining the circulation in individual organs or tissues under different conditions; and that it is specially suited for small animals.

Phosphate of lime has been found by Sidney Ringer superior in qualities to calcium chloride as an ingredient in an artificial circulating fluid. As between the various solutions named, in respect to their efficiency to sustain contractility of the heart, comparative experiments showed that saline solution is least effective; saline containing sodium carbonate is next in order; then phosphate of lime saline; and next, phosphate of lime saline containing potassium chloride. When sodium bicarbonate is added to the saline, the composition is stronger in the midwinter months. Hence lime and potash salts appear to be as necessary to the metabolism of muscle at rest as to the metabolism occurring during a muscular contraction. While the author finds that the alkaline-soda salts do not play so important a part in the production of the contractions as Biedermann supposed, both authors agree that temperature strongly influences the contractions. At a low temperature these movements become somewhat rhythmical. From comparative experiments with a number of other salts, the inference is drawn that substances of that nature in part sustain contractility by preventing or lessening the twitching of the muscles.

From experiments made to ascertain the nerve centers for respiration, Dr. Laborde found that superficial mechanical injury to the region of the *alae cineræ* does not accelerate respiration; if the injury penetrates at least to the middle of the substance, respiration may cease altogether. This result is always obtained if a certain circumscribed portion of the substance is cauterized with the hot iron. The iron must, however, enter immediately above the apex calami, and must penetrate at least half the substance from the raphe. If the injury is unilateral, respiration may continue for some little time on the opposite side. Total separation of the medulla below the apex calami always arrests respiration of the trunk, while that of the head continues for some time. Spinal reflexes continue, and even increase; irregular superficial contractions of the respiratory muscles, leading to no results, may be observed. The increase of the reflex action is especially remarkable in new-born animals.

It has been shown by Dr. Marcet that different persons respire different volumes of air to furnish to the body the oxygen required, and to yield a given weight of carbonic acid. Thus, to produce one grain of carbonic acid, three persons were found to need, on an average, 9.29, 10.51, and 11.30 litres of air, respectively. The first was twenty-three years of age, the third sixty. The influence of food on the formation of carbonic acid in the body begins in the first hour after a meal, and increases for two or three hours, the

period of maximum respiration of carbonic acid varying in this time. After a certain time the weight of carbonic acid expired decreases more rapidly than the required volumes of air decrease. The influence of local variations of air pressure appears in less air being needed for a given amount of carbonic acid with low pressures than with high; but the degree of the influence varies in individuals.

From experiments in elevated regions of South America, M. Viault finds that the proportion of oxygen contained in the blood of men and animals (indigenous or acclimatized) living in the rarefied air of mountainous regions is sensibly the same as that which is contained in the blood of men and animals living at lower levels. Both he and Mr. A. Müntz find that animals living at great altitudes—that is, in a medium where the pressure of oxygen is low—have the proportion of hæmoglobin in the blood increased; whereby the blood acquires an absorbing power for oxygen which compensates for the effect of rarefaction. Altitude is not necessary to produce these modifications, but the same results may be obtained if, instead of diminishing the amount of oxygen, the quantity of combustible matter is increased.

The researches of Mr. Raphael Dubois have led him to the conclusion that the production of light in animal organisms is due to the transformation of the colloidal protoplasmic granulations into crystalloidal granulations, taking place under the influence of a respiratory phenomenon.

Prof. T. P. A. Stuart has determined by experiments with rings of crinoline steel that the form of the thorax is determined in part by gravitation. The shape of the thoracic segment of the quadruped, of the human fœtus, and of the human adult are reproduced in succession if the ring be held between finger and thumb and turned, from lying in the vertical, till it lies in the horizontal plane. The complete reproduction of the different features of the adult human thorax at its most characteristic level is striking. The author's hypothesis was also borne out when deformities were imitated by holding the rings under abnormal modes of suspension.

Digestion.—An investigation is described by R. H. Chittenden and J. A. Hartwell, the object of which was to obtain some positive data regarding the relative formation of albumoses and peptones in artificial gastric digestion. The experiments showed that the formation of peptone is a gradual process, and that the greater part of the peptone formed by the action of pepsin-hydrochloric acid passes through the stage of albumose or proteose, and that at the end of the most vigorous gastric digestion a considerable part of the proteid digested will be in the form of proteose. The authors are not able to say to how great an extent it will be necessary to modify these conclusions in applying them to the proteolytic changes of natural digestion.

The nature of the change undergone by gelatin when, under the influence of gastric and pancreatic juice, it becomes liquid and loses the power of gelatinization, has been investigated by R. H. Chittenden and Fred. P. Solley. The results of the investigation showed that three products are formed in the digestion of gelatin with gastric and pancreatic juice, two of which

are primary products, and are to be distinguished from the third product, gelatin-peptone, by being precipitated by saturation with ammonium sulphate. The primary products by further ferment action are gradually changed into true peptone, the proto passing first through the stage of deutero. Owing to the difficulty of separating the ammonium sulphate completely from the peptone, the latter could not be obtained in sufficient quantity and in a sufficient state of purity for analysis. The gelatoses are readily soluble in cold water, are slowly diffusible, and in composition resemble gelatin itself. They are supposed to be formed by hydration, but their chemical composition affords no evidence of this view.

Recapitulating the results of their experiments on the action of salts on heat coagulation, Sydney Ringer and Harrington conclude that lime and the allied elements favor the heat coagulation of the proteids of serum. A similar action is exerted by magnesium sulphate. It is of interest to note that in the process of coagulation by heat, as in the process of spontaneous clotting of blood, and the clotting of milk to which rennet has been added, lime plays an important part. This similarity of behavior holds for barium and strontium, and is believed to be generic, for the reason that the influence of the same elements upon heat coagulation appears to belong to their salts generally. One is led to infer a possible likeness in nature between heat coagulation and spontaneous clotting of proteid bodies. But that there are differences between heat coagulation and spontaneous clotting we learn from the fact that in the former the solution becomes more alkaline, whereas in the latter, as also in the stiffening of muscle in *rigor mortis*, there is a development of acid. It has further been shown that a certain amount of antagonism exists between potassium and sodium chloride on the one hand and lime chloride on the other.

The following are the results of the researches of L. Huguoncq on the influence of wines on pepsic digestion: All wines interfere with the action of pepsin, those richest in alcohol, cream of tartar, and coloring matter being most injurious. Among the elements of natural wine the coloring matters act in concert with the alcohol and the cream of tartar to arrest pepsic digestion. The acidity of normal wines can not excite the action of pepsin, and in most cases it does not appear to assist. Among the coloring matters introduced fraudulently into wines, methylene blue, azoflavine, solid blue, and magenta interfere with pepsic digestion. The vegetable colors, black mallows, elder-berries, and maki, like aniline, exert an injurious action. Plastering, by removing a part of the cream of tartar, eliminates an element of natural wines which retards the action of pepsin *in vitro*. Digestion is more rapid in presence of plastered wines than of natural wines, but the advantage which plastered wines have in this respect does not conceal their other disadvantages.

Experiments by T. Lauder Brunton and S. Martin on the action of alcohols and aldehydes on proteid substances indicate that the higher alcohols in the series have a less powerful action in precipitating and coagulating proteids than the

lower ones. Allyl alcohol is an exception. It is a powerful coagulant of egg albumen, and is the only alcohol that coagulates albumoses.

Concerning the relation of the salts to casein, Söldner starts with the observation that the basis of the ash of milk can not be neutralized by the acids present, as the amphoteric reaction of the milk requires. He shows that 25 per cent. of the phosphoric acid comes from the phosphorus of the casein or its nuclein, and is preformed in the milk. Casein behaves like an acid, inasmuch as it may form salt-like combinations with alkalies, two of which Söldner was able to distinguish as neutral or basic calcium compounds. The neutral compound is probably present in the milk. The existence of various organic acids in the milk is also probable. The calcium salts play an important part in boiling and in the curdling process. Heated milk shows a more marked increase in alkaline reaction which loses itself on cooling, but all feebly alkaline liquids do the same. It is not true that boiled milk can not be curdled with rennet. The process is much slower, because a portion of the essential calcium salts has been changed by heat to insoluble tricalcium phosphate. The addition of alkali has a similar action. Introducing an acid to make the phosphate soluble brings back the curdability. In the same sense the addition of calcium chloride hastens the curdling.

An examination of what are called peptonized foods—Benger's peptonized beef-jelly, Darby's fluid meat, and peptonized milk having been selected for the purpose—by P. Horton-Smith, resulted in the conclusions that these foods consist really for the most part of albumoses, though they contain also a varying amount of true peptone. They can not, therefore, entirely relieve from work the digestive organs; and, also, that the ingestion of large quantities of albumoses and peptones does not disarrange the metabolism of the normal body.

The studies of M. Van Puteren on the digestive processes in infants have shown that the contents of the stomach remain in a condition to be pumped out for an hour and a half after a meal, the quantity diminishing rapidly after the first hour; that the acidity of the infant stomach is much less than that of the adult stomach; that the antifermentative action of the gastric juice seemed to be exceedingly feeble; that the milk-curdling element (called rennin by Foster) was absent in children up to twenty-four days, and could be definitely demonstrated only at from thirty to forty days of age.

From the results of three described experiments the conclusions are drawn by R. H. Chittenden that alcohol in the quantities employed by the experimenters, and in the case of dogs, has no very striking specific action upon the general metabolism of proteid matter; and that, so far as its general influence on proteid metabolism is concerned, it acts in the main simply as a non-nitrogenous food. As such it would yield a certain amount of energy by its own oxidation, and thus tend to protect slightly the consumption of proteid matter, and hence conserve the tissues. Assuming this view to be correct, one could not expect any very great diminution in the nitrogen output under the influence of alcohol. At the same time, it must be remembered that alcohol

is a potent drug, and as such may exert at times some specific action upon metabolic changes. Alcohol may then be considered as having the power to diminish somewhat the metabolism of proteid matter, and thus to conserve the tissues—a power which is dependent mainly upon its character as a non-nitrogenous food. At the same time, it has some specific action upon nutrition, as is manifested in its tendency to increase the excretion of uric acid.

From experiments made upon himself, Dr. Eichenberg found that a small dose of strong alcohol, as in brandy, shortens the time that food in general—whether animal or vegetable, or a mixture—remains in the stomach by more than half an hour. A similar but not quite so marked effect is produced by a dose of dilute hydrochloric acid or mustard. Pepper and cundurango diminish the time the food remains in the stomach by about a quarter of an hour. Beer and an infusion of rhubarb had no effect.

The nature and composition of the peptone formed by the action of trypsin on myosin, and the character of the residue of insoluble matter which is found after the digestion of myosin with pancreatic juice, have been studied by R. H. Chittenden and Ralph Goodwin. The authors found in myosin-peptone another illustration of the fact that peptones differ widely from the mother proteid in containing a much lower percentage of carbon—a fact which they regard as favorable to the view that the formation of peptone is the result of a process of hydration.

An opportunity has been enjoyed by Drs. MacFadyen, Nencki, and Sieber of studying the chemical processes of the small intestine in a patient who had an intestinal fistula. The false anus was situated in the ileum just above the ileo-cæcal valve, so that the materials escaping thereby were wholly composed of the chyme which had passed through the whole length of the small intestine. The patient continuing in this condition for six months, a long series of observations could be made relative to the time and character of internal digestion under varying forms of diet, etc. The material, or chyme, if it might be so termed, that escaped from the fistulous outlet was more fluid and diarrhoeal when the diet was albuminous than when it was mainly of a vegetable nature. The flow from the small into the large intestine was steadily continuous, but less marked during the night, when no food was taken; and by some ingenious experiments it was shown that the passage of foods from the mouth to the cæcum occupies at the least two hours; but the traces of the substances introduced did not disappear wholly for from nine to fourteen or even twenty-three hours. The fact was brought out that albumen is hardly, if at all, decomposed in the small intestine. Even the action of the trypsin of the pancreatic juice is small. The bacteria of the small intestine are concerned in the disintegration of the carbohydrates into lactic, acetic, and succinic acids, and into ethylic alcohol. While it is generally believed that the chyme is rendered alkaline by the secretion of the small intestine, the authors found the total quantity of acid to be more than could be neutralized by the bile, pancreatic, and intestinal juices.

During his experiments on emulsions, B. K.

Rachford found that heating neutral olive oil developed fatty acid and made it emulsible, and that if this heated oil was again neutralized it became non-emulsible, thus showing the emulsibility to be due to the acidity. The results of experiments with this and with castor oil indicated that the fatty acids of an oil are the fatty acids best adapted for giving emulsibility to this particular oil. The splitting of fats is a most important preliminary step in fat digestion. That the cooking of fats will develop in them a fatty acid is therefore a fact of considerable physiological importance, and one that, so far as the author knows, has not previously been noticed. It is his belief that the chemical force developed by soap formation is the chief factor in the formation of all physiological emulsions.

The changes produced in casein by the action of pancreatic and rennet extracts have been investigated by J. Sydney Edkins, who mentions among the facts which he has determined that there exists in pancreatic extracts a ferment which has the power of causing some alteration of casein to occur, apart from proteolytic changes, and this is manifested in appropriate conditions by the clotting of milk or casein solution. This ferment can be differentiated to some extent from the proteolytic ferment, and then appears to be a ferment comparable to the rennet ferment of gastric extracts. With active pancreatic extracts the proteolytic ferment has such power that the altered casein exists but a short time before it is further changed. The addition of neutral salts will result in the clotting of milk under the influence of pancreatic extracts, when otherwise no apparent tendency to clot existed. This can not be referred to the retarding influence of such salts upon the proteolytic ferment. When no change apparent to the naked eye has occurred in milk as the result of the action of pancreatic extracts, a change may be shown to have occurred by the application of heat, by the addition of an equal bulk of saturated solution of sodium chloride, or by the addition of exact quantities of acid. The same changes occur in milk when treated with minimal quantities of rennet ferment, in such amount as to produce no actual clotting. This changed casein, or metacasein, as it has been termed by Roberts, may be separated by the addition of sodium chloride, and purified. A solution of this metacasein does not clot when subjected to the action of rennet. The properties of this metacasein indicate that it is closely allied to tyrein.

Nervous System.—In his successive publications on sleep and its causes, Dr. James Caprie accepts the position usually taken by physiologists, that the state of sleep is accompanied by a diminished brain circulation, but contests the view that it is due to a diminution of the whole mass of blood within the cranial cavity, and that the compensation for this diminution is got by an increase in the amount of cerebro-spinal fluid in the ventricular and sub-arachnoid spaces of the brain. He believes that, lying within a closed cavity possessing rigid bony walls, the brain can not be affected directly by the pressure of the atmosphere; and that this can influence the interior of the cranium only through

the blood-vessels—so that a force is constantly in operation to maintain the amount of blood within the cranial vessels. The author acknowledges that molecular actions of a subtle kind take place between the blood and blood-vessels and the nervous tissues, and these are much less active during sleep than during wakefulness. The lessened activity in the nutrition of the nerve protoplasm diminishes the activity of the capillary circulation. The change in the balance of the circulation between the arteries and capillaries on the one hand and the veins on the other is regarded by Dr. Cappie as the keystone of the theory of the causation of sleep. The altered balance of the circulation occasions a change in the balance of active pressure, which is not so much within the brain substance as on the surface. It is less expansive and more compressing, and with this compression consciousness is suspended. In a new chapter "On Some Points in Mental Physiology" Dr. Cappie considers how far the peculiarities of the encephalic circulation may affect the functional activity of the different parts of the brain. Starting from the position that the brain is a composite organ, and that different portions are put into a state of functional activity in connection with the discharge of their respective duties, the question of the balance of the circulation has again to be considered. For the part which is more immediately concerned in the production of the particular cerebral operation must become the seat of vascular excitement, and the amount of blood flowing through its vessels will be greater than that transmitted through the vessels of those other parts of the brain which are not for the time so functionally active. Hence a certain tension of the area or center which is actively working must arise, and the encephalic circulation is focused in the direction of activity. In applying his views on the encephalic circulation to the explanation of the phenomena of hypnotism, the author remarks that the first incident in the hypnotic state is a steadily prolonged effort of volition in which the attention is concentrated in a very restricted direction. The immediate consequence is a fatigue of the nerve centers concerned in keeping up the strain. Their molecular motions become enfeebled, the circulation through them is less active, and a condition approaching that of sleep is produced. If then, in the form of a suggestion from another, some stimulus calls into activity a part of the brain not fatigued in the effort of attention, its vascular activity will be increased, and its function will be intensified.

Experiments by G. N. Stewart on the relations between temperature and endocardiac pressure and the action of the nerves of the batrachian heart show that both the vagus and the sympathetic have their activity diminished as the temperature is lowered, and increased as the temperature rises. The sympathetic curve, however, falls more steeply with falling temperature than does the vagus curve, so that the vagus is generally still active with a temperature at which the sympathetic has ceased to act. An increase of endocardiac pressure sufficient to abolish the inhibitory action of the vagus leaves the sympathetic still active, and the primary augmentation, may be attributed to the sym-

thetic fibers in the mixed nerves. Heat standstill of the heart, when there is no constant stimulus acting, such as a high endocardiac pressure, is always diastolic, and can never be described as "heart tetanus."

Two Italian doctors have related, in the "Revista Sperimentale di Firenze," the results of a series of experiments undertaken to determine the influence which the posterior nerve-roots have on the excitability of the anterior roots. In the first series of experiments the posterior roots were treated with cocaine; in the second, they were divided; in the third, they were stimulated electrically; and in the fourth series the cord was divided below the medulla. It was found that when the posterior roots were rendered functionless the excitability of the anterior roots was diminished; but when the posterior roots were stimulated, an over-excitability of the anterior roots was produced, which went on in a short time to diminished or even abolished irritability, and the same results were found when the cerebro-spinal system was intact and when the cord was divided below the medulla.

Having shown that lesions either of the corpus striatum or optic thalamus of the rabbit produce a rise of bodily temperature, while lesions of the surrounding white matter have no such effect, W. Hale White, in subsequent experiments, attempted to limit more precisely the positions in this neighborhood causing a rise of temperature, and also made experiments on other parts of the brain. He concludes that, the normal rectal temperature of a rabbit being between 101° and 103° F., neither an anæsthetic nor an operation on the brain affects the temperature much, unless some special part of the brain is damaged; that lesions of the corpus striatum, if not large enough to give rise to shock and severe hæmorrhage, and lesions of the septum lucidum cause a rise of temperature; that lesions of the optic thalamus and of the cerebellum do not alter the temperature, and lesions of the white matter around the corpus striatum and optic thalamus do not cause a rise; that lesions of the anterior part of the upper surface of the cerebral vertex either do not alter the temperature, or the alteration is very slight; that lesions of the posterior part of the upper surface of the cerebral cortex may cause irregular rises of temperature, which are quickly produced and last only a short time—sometimes there are several rises and falls after one operation; and that lesions of the crus cerebri cause a considerable rise of temperature.

It is well known that in some animals, when they are under the influence of strong emotions, the hair of particular regions of the body becomes erect (horripilation). Observations to determine the origin in the central nervous system of these erections have been made in the monkey by C. S. Sherrington, and in the cat by J. N. Langley. The authors jointly publish the conclusions that the hair of the monkey, cat, and probably of all animals in which horripilation occurs under the influence of strong emotion, as fear or anger, may be erected by stimulation of nerve fibers which issue from the spinal cord and pass through the sympathetic nervous system. These hairs have no direct spinal supply. The nerve fibers by means of which the erections occur are called pilo-motor nerve fibers. In the

monkey (*Macacus rhesus*) the pilo-motor nerve fibers for the head issue from the spinal cord in the anterior roots of the third and fourth and to a less extent of the second and fifth thoracic nerves; they run to the sympathetic chain, ascend the cervical sympathetic, and become connected with nerve cells in the superior cervical ganglion. The parts of the head affected are the forehead, the front half of the scalp, the temple, the cheek, and the upper part of the whisker. On stimulating one sympathetic the effect is chiefly on the same side, but stretches a short distance over the median line. Pilo-motor nerve fibers for the buttock, thigh, and tail issue from the spinal cord in the roots of the twelfth thoracic, first, second, and third lumbar nerves; they pass into the lumbo-sacral sympathetic chain and descend it: they are finally distributed in the skin of the upper part of the buttock, the back of the thigh nearly as far as the knee, and to the root of the tail. In the cat, pilo-motor nerves leave the spinal cord to run to the sympathetic chain in each nerve from the fourth thoracic to the third lumbar; sometimes also from the third thoracic nerve. Fibers from the third or fourth thoracic to the seventh thoracic nerve inclusive, ascend in the cervical sympathetic, become connected with nerve cells in the superior cervical ganglion, and supply the hairs of a region between the ear and eye, and of a strip of skin beginning at the back of the head and extending down the back of the neck. These fibers are not functional in all cats. The hairs of a strip of skin of the back and of the dorsal part of the tail are supplied by pilo-motor fibers from about the seventh thoracic to the third lumbar nerve. This strip overlaps with a strip of the skin of the back about ten centimetres long which is supplied by each of the thoracic spinal nerves. There are reasons for supposing that each spinal nerve, the roots of which contain pilo-motor factors, is connected with four or five sympathetic ganglia and their gray rami. The second and third lumbar nerves supply pilo motor fibers to the tail, and in addition the second lumbar nerve possibly supplies a small part of the back. With any two spinal nerves, from the seventh thoracic to the third lumbar inclusive, the position of the maximum effect on the hair is more positive with the lower nerve than with the upper one. The pilo-motor nerves for the tail are connected with nerve cells partly in the third sacral, but chiefly in the first coccygeal ganglion. Stimulation of the spinal nerve or of the sympathetic chain on one side gives mainly unilateral effects on the back; but in the tail the effects are usually bilateral.

Experiments by G. N. Stewart go to show that the conduction in animal tissues is chiefly electrolytic; that the best conductors are the inorganic constituents of the tissues, and next some of the nitrogenous metabolites, while the proteids are exceedingly bad conductors; and that the proteids are affected not by primary electrolysis, but by the products of electrolysis of the salts. Further studies have been made on the effects of electrolysis on isolated tissues and on some of the liquids of the animal body, and the effect in the living body is still under examination.

Special Senses.—A case bearing upon the relation of the optic thalamus to the special senses and to common sensibility is described by Dr. Hugo Engle, of Philadelphia. The patient had felt vague symptoms of affection of the central nervous system, consisting chiefly of pain in the head, with occasional acute exacerbations, and giddiness. One morning he staggered, and associated this with loss of sensation in the right foot. He next found that the whole right side of his body was anæsthetic, and that he had lost the power of tasting and smelling on that side. Nine days later he had lost taste and smell on both sides, and was deaf in both ears. Two days later he became suddenly blind in both eyes, had frequent convulsions, and died in one of them. At the necropsy, characteristic changes were found in the cerebral, and a large gummatous growth, starting apparently from the fornix, had been spreading back over both optic thalami. It was more extensive and apparently older on the left side than on the right—an indication that this side had been first involved in the morbid process, which corresponded also with the earlier symptoms on the right side of the body. The author points out the existence of four collections of cells in the thalamus described by Luys. The most anterior, which is probably in some way connected with smell; the second, possibly connected with hearing; the third, with general sensibility; and the fourth, in the region of the pulvinar, connected with the visual tract.

The existence of a membrane lining the fossa patellaris of the corpus vitreum had been the subject of discussion till it appeared to be contradicted definitely by Schnalbe in 1886-'87. Prof. T. P. Anderson Stuart has, however, informed the Royal Society that he has found that in the fresh, unaltered eye, after the removal of the lens in its capsule, there may be raised off the surface of the jelly a membrane which, when strained and mounted, does not show any structure. When the membrane from the four-year-old ox eye was isolated and tied over the mouth of a test-tube $\frac{3}{4}$ -inch wide it sustained a column of water 40 inches high. A smaller column than this may be sustained for days together. When isolated, it may be dried to form a delicate membrane.

While the common teaching is that there is a direct continuity of substance between the suspensory ligament and the capsule of the lens, an observation by Prof. T. P. A. Stuart seems to indicate that the ligament is only cemented to the capsule. On opening eye-balls in an advanced state of decomposition—putrid—he found the lens in its capsule free, and no indication of any rupture of tissue along the line of attachment of the suspensory ligament. The ligament was found intact projecting from the collapsed vitreous body as a sort of frilled ring with a free edge.

Prof. Dubois, of Bern, studying the production of luminous sensations in the human eye under the action of galvanic currents, finds that sudden variations of intensity, especially at making and breaking the circuit, produce such flashes. With a moistened plate at the nape of the neck and a pad on the eye, a slight flash was perceived at a very low intensity; while at a considerably higher intensity the observer could

perceive which pole was applied to the eye. On the other hand, the retina responded much less readily to discharges from condensers or induction coils.

Dr. C. L. Herrick, in the American Association, presented the case of a supposed tubercular disease of the eye of a cat, which was shown by autopsy to be accompanied by a marked degeneration in that part of the brain—in the occipital lobe—which is supposed to be connected with the organ of vision. Another confirmation is thus afforded of the theory of cerebral localization.

From the necropsy of a right handed woman who had been word-deaf for fifteen years, and deaf and partially paralyzed for nine years, Dr. C. K. Mills thinks he is justified in contending that the center for word-hearing is situated in the hinder third of the first and second temporal convolutions, and is possibly restricted to the second, and that, although the auditory cerebral arrangements have their chief development in the left temporal lobes, destruction of the opposite center is necessary in order to abolish hearing entirely.

Muscular System.—It has been observed by Dr. John Berry Haycraft that where a muscle is stimulated by an electrical shock all the fibers of the nerve receive the same stimulus and all the fibers of the muscles to which the nerve passes contract together and in the same way. This is not the case when a muscle contracts on receiving a natural nerve stimulation. The central nervous system seems unable to affect all the fibers of a muscle through the numerous nerve fibers passing to it in such a manner that they all shall contract exactly in the same way. This is supposed to be the case from the fact that fascicular movements are always present within a muscle during a voluntary or a reflex contraction, so that tracings taken from different parts of the same muscle invariably differ from one another. These fascicular movements occurring within it will prevent any muscle from pulling with perfect steadiness on any lever or other registering apparatus, and the tracings taken by means of such apparatus will show oscillatory waves, often very rhythmical in their appearance. Many observers have concluded from an explanation of these tracings that they indicate that the central nervous system discharges impulses into the muscle at a rate corresponding with that of the oscillations observed. The author finds that the fascicular movements account fully for the oscillations; he suggests, also, that they probably account for the production of the muscle sound, which Helmholtz has pointed out was chiefly an ear-resonance sound.

As the results of research made several years ago, Prof. Haycraft believes that the cross-stripping of a muscle depends on the moniliform divisions of the muscular fibrils, and not on their structure. In later experiments he took castings of muscular fibers, assuming that if the casts should exhibit the microscopical appearance of the muscle those appearances could be due only to its form. After several trials he found the most satisfactory method to be that of stamping moist collodion with fibers. A drop of collodion was placed upon a glass slide, and before it was quite dry some muscle fibers were pressed upon it

with the fingers. These were then removed, and the film, on being examined with the spectroscope, was seen to be covered by exquisite impressions of the fiber. Every stripe was clearly and sharply defined. When the collodion dried the film shrank and the little impressions disappeared. The castings showed the microscopical appearance of the fiber in whatever stage of contraction or relaxation it might happen to be.

To the usual well-known ways of stimulating muscles to contraction—viz., electrical, thermal, mechanical, and chemical—M. d'Arsonval has recently added that by means of light. He could not, indeed, get any contraction in a fresh frog muscle when he suddenly threw bright light upon it in a dark chamber; but, having first in darkness stimulated a muscle with induction currents too weak to give a visible effect, and then suddenly illuminated the muscle with an arc light, the muscle showed slight tremulation. Not thinking this conclusive, however, M. d'Arsonval attached a muscle to the middle of a piece of skin stretched on a funnel, and connected the tube of the funnel by means of a piece of India-rubber tube with the ear. The muscle being now subject to intense intermittent light, he heard a tone corresponding to the period of illumination, and this ceased when the muscle was killed by heat.

The origin of the croaking or grunting noise made by the perch (*Haploidonotus gramicus*) has been investigated by Dr. W. R. Hamilton. The fish is furnished with a masticatory apparatus in the gullet, of which the lower division has a flat, triangular upper surface, studded over with spheroidal processes answering to teeth; while the upper division is composed of two parts united by a ligament, the lower surfaces of which are supplied with similar teeth. The divisions of this apparatus are furnished with powerful muscles by which they can be pressed together and moved rapidly on each other. By this process the fish masticates the crustaceans on which it feeds, and the croaking is produced by the teeth coming in contact.

Herr Meyer, of Hamburg, denies that ventriloquism consists in speaking while inspiring and without the cavity of the mouth acting as a resonator. On the contrary, he says ventriloquists speak while expiring and move their mouths. Laryngoscopic observations on the author, who practices the art, showed that in ventriloquizing the vocal opening of the larynx is shortened as it is when producing the falsetto, and that the soft palate is pressed back and the uvula becomes invisible. The graphic record of experiments made by Prof. Gad on Herr Meyer showed that the curve obtained when a certain sentence is spoken in the ordinary way is identical with the one which is described when the same sentence is spoken ventriloquially. In the latter case the volume of air expired was less than during normal speech. Dr. Benda believes that when ventriloquizing the Eustachian tubes are open, and the cavity of the tympanum, together with the tympanic membrane, are set into simultaneous vibration, for the curious veiled tones of ventriloquism resemble the tones produced by speaking while yawning, and then the Eustachian tubes are certainly open and the tympanic cavity acts as a resonator.

Explaining to the Physiological Society of Berlin the experiments which he had made with a view to the analysis of the muscular sense, Dr. Goldschneider said that he had availed himself of localized anæsthesia produced by Faradic currents, and of the exclusion of conscious volitional impulses. Perception of motion takes place at the joints, and is not affected by want of sensitiveness in the skin. The time required for the perception of the motion is very short, and is unaffected by the position of the limb. The muscles are not concerned in perceiving the position of the limb, this being dependent on the central nervous system, and the recognition of resistance experienced in raising and lowering weights is brought about by means of the varying pressure exerted by the surfaces of the joints against each other. The speaker summed up the outcome of his researches as a whole in the conclusion that the muscular sense is compounded of three peripheral sensations—of a sensation of movement resulting from the displacement of the condyles, of a sensation of weight produced by the tension of the tendons, and of a sensation of resistance due to the pressure of the articular surfaces against each other. There is still another sensation—that of position—which results from pressure, tension, and stretching of the skin and other local stimuli. Prof. Gad held, in opposition to these views, that the perception of resistance is not directly a sensation, but a judgment, based upon the relation of the movement to the innervation and muscular tension.

Miscellaneous.—A series of investigations of the growth of guinea pigs are described by Mr. C. S. Minot, in a paper on "Senescence and Rejuvenation." The author remarked some curious variations in the growth of male and female animals about the age of puberty, and a diminution in the rate of growth which occurs in animals of both sexes, beginning about the end of the fourth month, and which is greater in amount and longer in duration in the female, is believed to correspond to the post-pubertal retardation in man. Each animal, according to the observations, strives to reach a particular size, but while some grow for a time too rapidly, others grow too slowly; but it appears that if an individual grows for a period with excessive rapidity, a period of slower growth immediately follows, and *vice versa*. Those that remain behind for a time, if they continue in good health, make up the loss soon after. Hence, to dwarf a guinea pig permanently requires a very long interference. The fact is brought out that a female guinea pig may bear young without impeding its own growth. But immediately after delivery a great and rapid loss of weight occurs, and continues for several days. The diminution then proceeds at a slower rate for about three weeks, after which the recovery of weight begins. In the process of growing old, one of the most characteristic features is loss of the power of growth. Mr. Minot concludes that a progressive loss in the power of growth takes place in guinea pigs, beginning almost immediately after birth, and he extends his conclusion to embrace the supposition that a loss of growth power is equally demonstrable in the case of men and of other animals, and that there is lit-

tle doubt that it is true at least of all mammals. This conclusion raises the question whether other animals do not obey the same law, and sets, too, the more general problem whether in all living beings there is not a certain impulse given at the time of impregnation, and whether this impulse does not gradually fade out, so that from the very beginning of the new growth there occurs a diminution in the rate of growth.

Concerning the action of alcohol on the system, Chittenden's experiments show that in dogs it causes no very striking specific action upon the general metabolism of proteid matter. This author supposes alcohol to act as a non-nitrogenous food, protecting the nitrogen of the body and somewhat lessening the nitrogenous output. The excretion of uric acid was much increased by the action of the alcohol, but no distinct diuretic action was observed. Some inconclusive experiments by Strassmann upon a litter of puppies, some of which were given measured quantities of spirits, tended to show that the percentage weight was distinctly greater in the alcohol dogs for liver and kidneys, but especially for the fat. In experiments upon man, Strassmann endeavored to determine the elimination of alcohol by the lungs. In six experiments, upon three persons, the average amount excreted by the lungs during four hours was 5.1 per cent. of the quantity of alcohol taken. In five experiments, on two persons, an average excretion of 1.7 per cent. of alcohol through the kidneys was determined. Certain variations in these experiments suggested the possibility of the influence of renal peculiarities. Strassmann agrees with Bodländer, with whose experiments he compared his own, in supposing that the greater part of the alcohol is disposed of in the body and not excreted as alcohol. It appeared incidentally in another series of experiments that 60 grammes of alcohol had no deleterious influence upon the digestive powers of a man accustomed to take that quantity. The effect of the different alcohols on the heart has been tabulated by Dr. Hemmeter according to the average lessening of the amount of blood pumped out during thirty seconds. The table shows the effects to be in the following order, beginning with the smallest and advancing to the largest: Ethyl, methyl, propyl, butyl, and amyl alcohol. It shows a remarkable increase of the weakening effect of the alcohol as the member of CH_2 molecules increases, it being, with the exception of ethyl, or common alcohol, twice as bad in the case of each of the members as of its predecessor in the series. The justness of the criticism set up in these experiments has, however, been criticised, and they can not be regarded as conclusive. Attention is called by the author of the experiment to the fact that ethyl alcohol appears from the table to be the least deleterious of the series, and that it fails to act on the heart as, according to its chemical position, it should.

In experiments by MM. Charrin and Roger to determine the effects of fatigue upon the susceptibility to infection, 8 white rats which had been severely exercised for four days in a rotating squirrel cage were inoculated with the charbon virus, and with them 4 other animals that had not been exercised. Seven of the 8 tired animals died, while the 4 which had not

been subjected to the exercise survived. Similar results were obtained in other modified experiments, all leading to the conclusion that susceptibility is increased by fatigue.

A series of experiments is reported by Herr Rubner on the difference with which dry heat and cold and moist heat are born by the animal and human constitutions. Dogs, fasting or fed, being observed in an air calorimeter, it appeared that moist air increased the loss of heat by conduction and radiation. For every variation of 1 per cent. in the air moisture, heat was parted with to the extent of 0.32 per cent. In a previous investigation Herr Rubner had demonstrated the lessened yield of water by evaporation from animals when the air moisture is increased, involving lessened loss of heat. Here, then, are two antagonistic influences. The author is inclined to regard the increased radiation and conduction in the open air as the primary action, and the diminished evaporation as secondary. The colder feeling of moist cold than dry is readily explained by the increased heat radiation. In moist heat, with the sense of oppression it brings, this factor passes into the background. The degree of temperature, and some other influences of complex nature, also affect the amount of radiation.

The investigations by Heidenhain of the flow and production of lymph tend to the support of the theory that the supply of lymph to the tissues is derived from a secretion, as against that which regards it as a filtration from the blood. Among the considerations cited in support of this view are the amount of lymph that has to be furnished under certain conditions, certain influences of changes in arterial or venous pressure causing conditions not in accord with any filtration theory; and the discovery by the author of the existence of "lymphagogues"—substances which increase the lymph flow either by causing a direct secretion from the blood, or by withdrawing water from the tissues and sending it into the lymph and into the blood. In the increase of the lymph flow under the operation of lymphagogues of the first class, a quantitative comparison shows that the lymph has gained water and organic substances, but not salts, and that the blood plasma has lost water and organic substances. That this transfer of material is no filtration, is shown by the fact that when the blood flow has been shut off for some time the introduction of organic substances causes no increase in the lymph flow the prolonged anæmia, it is assumed, having altered the cells whose activity is involved. To the second class of lymphagogues belong sugar, urea, and salts when sent into the blood in considerable quantities. Such substances leave the blood rapidly, as others had shown, and the blood gains water. But the introduction of grape sugar or sodium chloride also enormously increases the amount of lymph and the flow of urine from the kidney. Since the amount of water in the blood, in the lymph, and in the urine becomes greater, it follows that this "sugar lymph" can have no other source than the water of the tissues; it is tissue lymph, and not blood lymph. The experiments suggest that the action of many saline waters may be due to such movement of the lymph as is shown in

them, which may be thought to purge and purify the tissues without the ordinary purging action of the salts being an important feature at all.

The way in which altered plant pigments take part in larval coloring has been under investigation by E. B. Poulson. The earlier experiments indicated that the green ground color of larvæ of certain species was due to derived green pigments dissolved in the blood, while it was argued that in other species the pigments passed from the blood into the hypodermic cells and so colored the larvæ. It was still uncertain whether the color of the blood assisted in producing any of the ground color in those larvæ in which the color was also segregated in the hypodermic cells. The author's later investigations with the larvæ of *Sphinx ocellatus* have shown that the blood is only faintly tinged with derived pigments, and that it can not produce any effect upon the larval appearance until it has been collected in the superficial cells. The fact that the derived pigment is associated with a proteid in the blood makes it almost certain that the processes of modification and association are the direct results of protoplasmic activity, and not of ferments, etc., which have themselves been formed by that agency.

Dr. F. Maas describes two chemically distinct groups of pigments occurring in man—melanine and granular coloring matters. The latter are found at all periods of life, but increase in quantity and in the size of the granules with age. They are normal products, not morbid; are not only transformed, but are produced by corpuscle-carrying cells, and are not wholly derived from the blood. The pigment found in the heart is derived from a fatty body. The several pigments can be distinguished by their reactions with hydrochloric and acetic acids, and with caustic potash.

Experiments are described by Dr. Yatsuty, of Zhitomir, Russia, on the influence of age on the rapidity of absorption of drugs. The author gave iodide of potassium or salicylate of soda, in doses proportioned to the weight of the individual, to healthy male subjects of ages ranging from eight to over eighty years. The urine was examined every three minutes in the case of both salts, and the saliva every two minutes in the case of the iodide—while no evidence of salicylic acid was detected in the saliva at any time. The general result of the tabulated experiments showed that absorption occurred more rapidly in the younger persons in proportion to their youth, but wide variations occurred in comparing individuals; so that although the average rapidity of absorption was found to diminish distinctly as age advanced, it was not possible to say with certainty that a particular person would absorb one of the drugs more rapidly than a person who was a good deal older.

PORTER, DAVID DIXON, an American naval officer, born in Chester, Pa., June 8, 1813; died in Washington, D. C., Feb. 13, 1891. His great-grandfather commanded a Boston merchantman, and rendered substantial assistance to the colonies during the Revolution; his grandfather commanded with distinction two Continental vessels in the same war; and the services of his father during the war with England in

1812-'15 were conspicuous in that unusually brilliant naval period. The laws of heredity would have been violated had the subject of this sketch not adopted the profession of arms. He studied at Columbian College, Washington, D. C., for some years, and saw his first service in 1824, when, at the age of eleven, he accompanied his father, then in command of the "John Adams," on an expedition to suppress piracy in the West Indies. His father resigned his commission in the United States navy in 1826 on account of what he deemed unjust treatment in regard to the Foxardo incident, and accepted command of the Mexican naval forces, followed by his son, who was appointed a midshipman in the same service. Young Porter was sent to the schooner "Esmeralda," commanded by his cousin, Captain D. H. Porter, and engaged in preying upon Span-

DAVID DIXON PORTER.

ish commerce. After an active, adventurous, and successful cruise, the ship returned to Key West on account of a mutiny on board, which was discovered by Midshipman Porter, then fourteen years old. He handed the pistols and sword to Captain Porter, who disabled the ringleaders and brought all to terms. Only three of the crew had remained faithful, and with these men on duty, and the mutineers ironed by a novel device to the deck, the schooner passed safely through the blockading Spanish fleet and got to port.

In 1836 Porter sailed as midshipman in the "Guerrero," commanded by his cousin. Off Mariel, Cuba, a convoy of Spanish vessels was encountered, accompanied by two brigs-of-war. Notwithstanding the inferiority of force, the "Guerrero" was cleared for action and headed for the enemy. The brigs ran under cover of a small fort, a spirited fire was opened, and in half an hour one of the brigs struck her flag and several of the convoy were sunk. At this juncture a Spanish frigate, the "Lealtad," hove in sight, and the "Guerrero" made sail to escape. Next morning the Mexican was overhauled by the Spaniard, and, seeing that escape

was impossible, Porter cleared for action. His first two broadsides were most effective, but the superiority of the "Lealtad's" metal told, and at the end of an hour the "Guerrero" was a surrendered wreck, the captain killed, and several officers and men killed or wounded. The "Guerrero" was towed into Havana, and Midshipman Porter was confined as a prisoner, having declined parole.

On Feb. 2, 1829, Porter was appointed a midshipman in the United States navy, and in 1830 he was attached to the frigate "Constellation," Mediterranean squadron. He was attached to the frigate "United States" in 1833, and to the line-of-battle ship "Delaware" in 1835, both belonging to the Mediterranean squadron. He was promoted to passed midshipman on July 3, 1835; was on coast-survey duty in 1837-'40; promoted to lieutenant, Feb. 27, 1841; on the frigate "Congress," Mediterranean squadron, in 1843-'45; at the Naval Observatory in 1846; on a special mission to Hayti and Santo Domingo, under the Department of State, in 1846. His success in this mission was substantial, and received high praise.

The outbreak of war with Mexico found Lieut. Porter unattached in Washington, and soon he was ordered to New Orleans in charge of recruits for the Gulf squadron, and on his arrival at Vera Cruz with 300 men was ordered by Flag-officer Conner, as first lieutenant of the "Spitfire," Capt. Tatnall. Operations against the enemy began on the relief of Commodore Conner by Commodore M. C. Perry, March 21, 1847. Fronting the south face of Vera Cruz a battery constructed and manned by the navy did great damage to the fortifications of the city, and in two days silenced most of the guns on that side. As several forts on the water side, opposite San Juan d'Ulloa, were out of effective range of the shore battery, Commodore Perry sent the "Spitfire" and three other vessels to attack them. The little flotilla anchored close under the city walls, and in a few hours effected great destruction in the enemy's works. At night Lieut. Porter volunteered and received

permission to scout in and sound the passages that led to the flanking forts of the city. This undertaking was completely successful, and early the next morning the four vessels got under way and attacked the southern batteries, Lieut. Porter acting as pilot through the intricate channels. The enemy was driven from his works, but the flotilla being exposed to a hot and dangerous fire from San Juan d'Ulloa, Commodore Perry signaled Tatnall to retire from action. This gentleman, however, had ordered his signal quartermaster not to look toward the flag-ship, and the action went on until a verbal order to retire at once was brought to Tatnall from the flag-officer. The flotilla then withdrew, amid hearty cheers from the main squadron.

In April, 1847, the "Spitfire" was again employed on active service. She, with four gunboats and a few small steamers, was dismantled for crossing the bar on an expedition to Tuspan. On this occasion she acted as Commodore Perry's flag-ship. The enemy was well fortified and armed, and had made all preparations for a determined resistance, but in half an hour after the fire was opened the Mexicans were

driven from their guns, the batteries were captured, and Tuspan lay at the mercy of the flotilla. Lieut. Porter, now executive of the "Spitfire," directed the fire of the heavy pivot gun, and to that gun's accuracy and rapidity of work was due much of the quick success of the fight. In May Capt. Tatnall was relieved of the command of the "Spitfire" by Capt. S. S. Lee, and the flag-officer, in early June, began preparations for an attack on Tobasco, up the river Tobasco. The expedition was composed of the light-draught vessels of the squadron, two bomb vessels, and several armed boats' crews, the whole being under the personal supervision of the commodore. On June 16 the "Spitfire" forced the obstructions in the river, passed up and attacked Fort Iturbide, with a full force of men and seven heavy guns. Lieut. Porter, with 68 men, landed, charged, and captured the fort. Meanwhile the commodore had landed 16 miles below and was marching overland upon Tobasco, and five hours after the capture of Fort Iturbide reached that point, his men very much overcome by the heat. But for the action of the "Spitfire," Commodore Perry's march might have had a more disastrous termination. For this gallant affair Commander S. S. Lee was promoted to the command of the frigate "Mississippi," and Lieut. Porter was given command of the "Spitfire." Porter was in every action on the Atlantic coast of Mexico during the war, and was also in several engagements on shore. His vessels never had an accident. In 1848 and 1849 Lieut. Porter was on coast-survey duty. On the discovery of gold in California he received leave of absence and obtained command of a Pacific mail steamer, the "Georgia." During 1854 he commanded a merchant vessel, the "Golden Age," and in 1855, his furlough having expired, he was ordered to the command of the store-ship "Supply." He was attached to the navy yard at Portsmouth, N. H., from 1858 to 1860.

On the breaking out of hostilities in 1861 Porter volunteered to save Fort Pickens, then invested by Gen. Bragg, if provided with sufficient force. President Lincoln, who had great confidence in Porter's dash and ability, considered and approved the scheme, and gave him command of an expedition consisting of the side-wheel steamship "Powhatan" and the troop-ship "Arctic," carrying 600 troops with their arms and munitions of war. The "Arctic" arrived off Pickens on April 16, 1861, and the "Powhatan" a day later. The first hostile gun fired by the navy during the civil war was fired by Porter at a flotilla of small boats proceeding to the attack of Fort Pickens. The enemy retreated in disorder, and in a few hours the fort was rendered secure against assault, and garrisoned by Gen. Meigs's men from the "Arctic."

In June Porter was on blockading duty; his ship, the "Powhatan," was stationed at the mouth of the Southwest Pass of the Mississippi, while the "Brooklyn" was guarding Pass à l'Ouvre. Notwithstanding the precautions taken and the vigilance maintained, the Confederate steamer "Sumter" got through Pass à l'Ouvre and put to sea. In a short time she committed great damage to our commerce and captured several prizes, one of which, the "Bradford," was taken by the "Powhatan's"

boats while attempting to steal into Barrataria Bay. Learning thus of the "Sumter's" escape, Porter made after her, but although he kept up the chase through St. Thomas, Curagon, Trinidad, Maranhão, and Paramaribo, and although he was at one time within 30 miles of her, the privateer finally escaped, and the "Powhatan" returned for repairs to the United States, where Porter was detached and promoted to the rank of commander.

On his relief from the command of the "Powhatan" he was called into consultation with the President, the Secretary of the Navy, and the Assistant Secretary, Mr. Fox, in regard to a proposed demonstration against New Orleans, which Commander Porter strongly recommended. He was also delegated to ascertain whether the command of the proposed expedition would be agreeable to Capt. David G. Farragut. That officer gladly seized his opportunity, and Porter was made second in command, in charge of a mortar flotilla, at his own suggestion, an auxiliary force, the character of which he was allowed personally to determine. It has been said on excellent authority that the command of the Mississippi fleet was first offered to Porter, who declined on the ground that he did not hold sufficient rank for a command of such magnitude, and that his services up to that period had not been of such importance as to justify his selection. That he then proposed Farragut's name is beyond all doubt. On the fleet's arrival at Belize many of the ships were found to be so deep that it was necessary to lighten them before they could cross the bar. Of this work Porter took personal supervision, and piloted the ships up the river preparatory to the passage of the forts, selecting a berth for each vessel. By Porter's order the mortar boats were covered with bushes, so that it was difficult for the enemy to distinguish them from the surrounding banks, and by this stratagem the effect of the Confederate fire was materially diminished. The result of the attack on Forts Jackson and St. Philip is well known. Throughout the engagement Porter was Farragut's right hand and counselor. For six days and six nights the mortar fleet unrelentingly bombarded the forts, the men being divided into three watches, and this destructive fire was a prominent factor in the successful result of the engagement. Flag-officer Farragut pushed past them to New Orleans, leaving their final reduction to Porter, to whom they surrendered on April 28, 1862. After the passage of the forts by Farragut's fleet, and after the terms of their capitulation had been agreed upon, the enemy set fire to the "Louisiana," a formidable ironclad, and started her down the river. When she hove in sight of the mortar flotilla they, being defenseless, left the scene of action, while Porter with all his fighting ships held their position, not one of them lifting her anchor. When nearly abreast of these vessels the "Louisiana" blew up.

For his services in this affair Porter received the congratulations and thanks of the Department. Mention was made of the brilliance of the victory, the hundred and forty-four hours consecutive bombardment by the mortar flotilla, and the fact that success was largely due to Porter's able assistance and untiring energy.

Having reduced the forts, Porter proceeded

with his mortar fleet to Vicksburg by order of the flag-officer, who had found the place strongly fortified. The mortar boats again did splendid service, and Farragut successfully passed the batteries on June 28, 1862. In his official report to the Secretary of the Navy the flag-officer says: "Commodore D. D. Porter came up on our starboard quarter with the 'Octorara,' 'Westfield,' 'Clifton,' 'Jackson,' 'Harriet Lane,' and 'Owasco,' and opened fire in fine style on the enemy." And again: "The mortar flotilla have never done better service than at Vicksburg, notwithstanding the imperfection of their fuses. I have no doubt they did the forts on the heights great damage, and on the morning of the attack did much to distract the fire from the fleet."

In July Porter was ordered with the mortar flotilla to operate against Fort Darling, on James river, just below Richmond. But the Secretary changed his plans and Porter was detached from the flotilla which he had made famous and ordered to the command of the Mississippi river squadron as acting rear-admiral. He took command on Oct. 15, 1862, and at once began active operations against the enemy.

In November, Capt. H. Walke, in the "Carondelet," commanded an expedition of ironclads and wooden gunboats up Yazoo river, during which the ironclad "Cairo" was sunk by a torpedo. A few days later Porter arrived at the mouth of the Yazoo, and led an expedition up the river to clear the channel of torpedoes and to draw a portion of the enemy from Vicksburg to the defense of the river. By Dec. 26 the river was cleared of all obstructions up to the place where the "Cairo" was sunk. On the 27th the expedition arrived at a bend in the river where a line of fortifications began, and the river was obstructed by a heavy iron-plated raft. While the boats were engaged in clearing the river, the flag-ship "Benton," Lieut.-Com. Gwinn, moved up to cover them. She was struck 30 times, and many of her crew were killed or wounded, among the latter her commander, mortally. The other vessels handsomely supported the flag-ship, and two of the guns were silenced; but the enemy's works could only have been captured by a strong landing-party.

On Jan. 4, 1863, Gen. McClernand having requested the co-operation of Admiral Porter in an attack upon Arkansas Post, the "Baron de Kalb," Capt. Walke, "Louisville," Lieut.-Com. Owen, and "Cincinnati," Lieut.-Com. Bache, with several light-draft vessels, were detailed for the purpose. Rear-Admiral Porter, in the flag-ship "Black Hawk," accompanied the expedition. After a battle of two days Col. Dunnington, commander of the fort, surrendered to the army and navy, yielding his sword to Admiral Porter. Seventeen heavy guns and a large number of troops were captured. For his services here Porter received the thanks of Congress.

On the next day Capt. Walke, with a force of gunboats, proceeded up White river. On the 14th the town of St. Charles was found evacuated. At Duvall's Bluff he landed a party and took possession of two fine 8-inch guns and about 200 stand of arms and accoutrements. At 4.30 A. M., Feb. 2, the ram "Queen of the West," Col. Charles E. Ellet, ran the Vicksburg batteries, with orders from Porter to capture or destroy

the enemy's transports between Vicksburg and Port Hudson. Col. Ellet arrived at Red river, capturing and destroying on his way several fine transports. The "Queen of the West" then returned to the vicinity of Vicksburg. A few days later she steamed down and entered Red river. On Feb. 13, Lieut.-Com. George Brown, in the "Indianola," ran the batteries of Vicksburg with orders to join the "Queen of the West." Shortly afterward intelligence was received of the destruction of the "Queen of the West" in Red river, and that the "Indianola" had been sunk in the Mississippi. They had destroyed a large amount of property.

In March a daring and novel attempt was made by Porter to get into the rear of Vicksburg. By ascending Steele's Bayou, which is merely a ditch, he was hopeful, by cutting a way through the woods and widening the channel, of finding an entrance into Yazoo river and here effecting his object. When Porter arrived within a short distance of Rolling Fork he found the channel impracticable and was forced to return. The expedition penetrated into the heart of the enemy's country before being discovered, and large quantities of cotton were destroyed. An attempt was made by Lieut.-Com. Watson Smith, with a detachment of gunboats, to secure control of the Coldwater, Tallahatchee, Yallabusha, and Yazoo rivers, which would have opened the way to the capture of Vicksburg, as most of the enemy's supplies were received through these streams. Owing to the want of troops to co-operate, the object of the expedition failed, although several steamers and 5,000 bales of cotton were destroyed. The "Switzerland" and "Lancaster," in attempting to pass the Vicksburg batteries to join Farragut at Port Hudson, were sunk, and many of their men disabled.

On April 16, 1863, the fleet, led by Porter, who had hoisted his flag on board the iron-clad "Benton," ran past the Vicksburg batteries. The vessels started in the following order, 50 yards apart: "Benton," Lieut.-Com. Greer; "Lafayette," Capt. Walke, with the "Gen. Price" lashed on the starboard side; "Louisville," Lieut.-Com. Owen; "Mound City," Lieut. Wilson; "Pittsburg," Acting Volunteer Lieut. Hoel; "Carondelet," Acting Lieut. Murphy; and "Tuscumbia," Lieut.-Com. Shirk, with 9 army transports. Nearly all the vessels took in tow barges containing each 10,000 bushels of coal, and all passed the batteries in safety. On April 29, Porter, with most of the armed vessels that had passed the batteries, bombarded for six hours the formidable works at Grand Gulf. At 6 P. M. the transports, containing a detachment of Gen. Grant's command, passed down under cover of the fire. On May 3, Porter, with four ironclads, proceeded to Grand Gulf to attack the forts, but found them evacuated; and before leaving, the enemy had destroyed all the ammunition and spiked the guns. Next to Vicksburg, this was the strongest position on the Mississippi. Its occupation greatly facilitated Grant's operations in reducing Vicksburg.

On April 29, Lieut.-Com. Breeze, with the "De Kalb," "Choctaw," and "Tyler," made a feigned attack upon Haines's Bluff, in co-operation with a division of the army under Gen. Blair, to prevent the enemy from sending

re-enforcements to Grand Gulf. The desired effect was accomplished. Early in May Porter ascended Red river as far as Alexandria, which he took possession of and held until Gen. Banks arrived. On the 15th he crossed over to Yazoo river, to be ready to co-operate with Gen. Grant. On the 18th the firing in the rear of Vicksburg indicated the approach of Grant. The cannonading was kept up furiously for some time, when Porter discovered a company of artillery advancing, taking position, and driving the enemy before them. Gen. Sherman's division had come in to the left of Snyder's Bluff, and the enemy had been cut off from joining the forces in the city. The "De Kalb," "Choctaw," "Linden," "Romeo," "Petro," and "Forest Rose," under Lieut.-Com. Breeze, were sent up the Yazoo to open communication with Gens. Grant and Sherman. This they succeeded in, and in three hours Porter received letters from Grant, Sherman, and Steele, informing him of their successes, and asking that provisions be sent up, which was done at once. In the mean time Walke, in the "De Kalb," pushed on to Haines's Bluff, which was found evacuated, and took possession of the guns, tents, etc. The works were destroyed. Upon this being reported to Porter, he sent up a force of gunboats from below Vicksburg to fire at the hill batteries, which was kept up for two or three hours. At midnight they moved up to the town and fired upon it for an hour, and continued at intervals during the night to annoy the garrison. On the 19th six mortars were placed in position, with orders to fire rapidly day and night. On the evening of the 21st Porter received a communication from Grant saying he intended to attack the whole of the enemy's works at 10 A. M. the next day, and asking the admiral to shell the batteries from 9.30 P. M. until 10.30 A. M. The mortars were playing rapidly on the town and works all night, and the "Benton," "Mound City," and "Carondolet" went up and shelled the water batteries and other places where troops might find rest. At 7 A. M. the "Mound City" crossed the river and attacked the hill batteries opposite the canal. At eight o'clock Porter joined her with the "Benton," "Tuscumbia," and "Carondolet," and all the vessels opened on the hill batteries and finally silenced them. The "Benton," "Mound City," and "Carondolet" then closed with the water batteries, leaving the "Tuscumbia"—out of repair—to keep the hill batteries from firing on the vessels after they had passed by. The water batteries opened furiously, supported by a hill battery on the starboard beam of the vessels. The ironclads advanced to within 280 yards and returned the fire without cessation, the enemy's fire being accurate and incessant. The vessels having been engaged an hour longer than Grant requested, and all having received shots under water which could not be stopped while under way, withdrew in a cool and handsome style. After dropping back, it was found the enemy had taken possession again of one of the lower hill batteries and was endeavoring to remove his guns, and had mounted a 12-pounder field-piece to fire at Gen. McArthur's troops that had landed a short time before. The "Mound City" and "Carondolet" drove them off in a few minutes.

On May 27, Porter, at the urgent request of Gen. Grant and Gen. Sherman, being led to believe the enemy had removed his guns to the land side, fitted the "Cincinnati" for the occasion by packing her with logs and hay, and sent her down to shell some works retarding the progress of the army. At 8.30 the "Cincinnati" left her anchorage and stood for the position assigned her. The enemy fired rapidly from all their guns, including those that were supposed to have been removed to the land side. The fire was very accurate, striking the "Cincinnati" almost every time, and passing entirely through her protection of iron, hay, and wood. Finding his vessel would sink, Lieut. Bache ran up stream as far as circumstances would allow, ran his vessel ashore, and succeeded in saving his wounded. She sank within range of the enemy's batteries; but her fire, until the magazine was drowned, was effective. Lieut. Bache received the thanks of the Department for his conduct on this occasion. On the night of June 19 Porter was notified by Grant that he intended to open a general bombardment on the city at 4 A. M. and continue it until ten o'clock. Commander Woodward, of the "General Price," received orders from Porter to move up with the "Mound City" and "Benton" and attack at the specified time. Lieut.-Com. Ramsey was given charge of a 100-pounder rifle, a 10-inch gun, and a 9-inch gun, fitted on scows, and placed them after midnight close to the point opposite Vicksburg protected by the bank. At the appointed time all the shore batteries opened fire, and also the guns on the scows and the mortars. A little later the gunboats opened a heavy fire, advancing all the time and throwing shells into all batteries along the hills and near the city. There was no response: the batteries were all deserted. At ten o'clock the vessels and mortars ceased firing. The mortar boats had bombarded the enemy's works for forty days continuously.

On July 4 Vicksburg surrendered to Gen. Grant. On June 7, Porter, learning that the enemy, about 4,000 strong, were about to attack Milliken's Bend, where military stores were kept, guarded by two colored regiments and part of the Twenty-ninth Iowa, the "Choctaw" and "Lexington," under Lieut.-Com. Ramsay, had been dispatched to protect them. The enemy attacked before daylight. The colored troops met the onset courageously, and a company of the Iowa regiment stood their ground until they were slaughtered to a man, killing an equal number of the enemy. The fight was desperate, and the troops overpowered were driven behind a bank near the water's edge, pursued by the enemy; but when the gunboats opened fire with shell, grape, and canister, the enemy fled in wild confusion. On the fall of Vicksburg Porter received letters of congratulation from Sherman and the Navy Department, acknowledging the powerful co-operation of the navy under his command and its great services during this memorable campaign. The fall of Vicksburg is referred to by Sherman in his terse style as a "victory won by the united navy and army of our country." Porter was made a full rear-admiral, to date from July 4, 1863, the day Vicksburg surrendered.

In March, 1864, Rear-Admiral Porter was ordered to co-operate with Gen. Banks in an expedition up Red river to Shreveport. Gen. Banks, having been defeated, was obliged to retire to Grand Ecore, leaving Porter and his vessels caught above the falls at Alexandria. From this perilous situation they were rescued by Col. Joseph Bailey, of the engineers, who constructed a dam across the river above the falls and enabled the fleet to escape.

On Sept. 22, 1864, Porter was ordered to relieve Acting Rear-Admiral S. P. Lee, commanding the North Atlantic squadron, whose ground of operation was between Cape Fear river and Wilmington, N. C. Porter arrived off Fort Fisher on Dec. 24, with 35 cruisers, 5 ironclads, and a reserve of 19 vessels. Eight thousand soldiers in transports, under command of Gen. B. F. Butler, accompanied the fleet. Porter opened fire on Fort Fisher on the day of his arrival, and, as he says in his official report, "In one hour and fifteen minutes after the first shot was fired not a shot came from the fort. Two magazines had been blown up by our shells and the fort set on fire in several places, and such a torrent of missiles was falling into and bursting over it that it was impossible for any human being to stand it. Finding that the batteries were silenced completely, I directed the ships to keep up a moderate fire, in hope of attracting the attention of the transports and bringing them in." Gen. Butler, however, having examined the fort, thought it "substantially uninjured as a defensive work by the naval fire," and returned to Hampton Roads without making an assault. The ships, thus deprived of military co-operation which was necessary for the reduction of the work, went to Beaufort, N. C., where Porter began preparations for another attack, and wrote to Gen. Grant: "Send back the same soldiers with another general, and we will capture Fort Fisher." With this request Gen. Grant complied. The troops, now under the command of Gen. Alfred H. Terry, returned to Fort Fisher, and were landed by the boats of the fleet on Jan. 13, 1865, and the fleet again bombarded. On Jan. 15 the soldiers assaulted the fort from the rear, and, aided by an attack of the naval brigade on the sea-face and by the heavy fire of the fleet, captured the fort after seven hours of hard fighting. For his efforts on this occasion Porter received the thanks of the President and Congress and a vote of thanks from the State Legislatures. This was the fourth vote of thanks given him during the war.

After the fall of Fisher, Porter proceeded, with one monitor and all his light-draught gunboats, to the attack of Fort Anderson, a strong work up Cape Fear river, which he reduced on Feb. 18, 1865. He next directed his movements to Fort Strong, a battery commanding the obstructions in the river. This work he soon rendered harmless, and he then passed the obstructions without opposition. He appeared with his fleet off Wilmington on Feb. 22, 1865, and this closed the last Southern port to supplies from abroad.

Porter's next move was to City Point, where he kept a portion of his fleet during the operations against Richmond. Rear-Admiral Semmes, of the Confederate fleet, hearing the fire of the

gunboats at Dutch Gap, imagined the Federal ships to be approaching in force, and destroyed all his own vessels, with their equipment.

After the fall of Richmond, Porter escorted the President to that city with his light gunboats, having rendered the last important naval service of the war.

Porter returned to Washington to receive the homage due to his achievements. It was well for the country that he should have been in the beginning of the war at the seat of Government, to advise and assist in shaping the naval policy. In all this he was closely associated with Gustavus V. Fox, formerly an officer of the navy, a man of great ability, who was one of the assistant secretaries of the navy. When Porter was presented to Lincoln, with the remarkable faculty the President possessed of reading character, he took in the proportions of the man, and through the terrible strife advised with Porter in all matters pertaining to the navy more than with any other officer. Long before the outbreak of the war, when the mutterings of the storm alone were heard, but daily growing in strength until the strife seemed inevitable, the navy, with the exception of some of Porter's seniors, hailed him as the coming man who was to lead them to victory. He was thoroughly equipped in all branches of his profession, a man of great energy and of an invincible courage, and known to possess a large and varied experience, such as is only to be acquired in actual warfare, and the great results that he accomplished show the transcendent qualities of the man.

For several years Porter was engaged on the Coast Survey, and he thus acquired an experience that proved to be of great value, which he turned to good account during the civil war, when every man in command had to be his own pilot. This experience enabled him to take the vessels composing Farragut's fleet over the bar of the Mississippi river, and to bring them to an anchor in the river below the forts preparatory to the grand attack. Especially valuable was this knowledge in carrying out his plan of attack on Fort Fisher; every ship, in accordance with the programme, moved into its berth, which was no sooner taken up than fire was opened upon the fort. This was Porter's crowning achievement, and brought forth in the strongest light the splendid qualities of a great naval captain. He was gifted with singular prevision in planning enterprises of moment. No detail was insignificant in his judgment. When the time for action came, he found his vessels ready in all respects to respond to his call. As an organizer he was unexcelled. In all of his operations every emergency was considered and provided for. It was in times of the gravest peril that his qualities as a leader were most manifest, and, cool, calm, and self-collected, he brought victory from defeat and order from confusion.

Porter was appointed Superintendent of the Naval Academy, Sept. 9, 1865, and retained charge until 1869. He was commissioned vice-admiral July 31, 1866; on a mission to Santo Domingo in 1866; on special duty at the Navy Department in 1869-70; commissioned admiral Aug. 15, 1870; on special duty at Washington from 1870 until his death.

Admiral Porter had an appreciative knowledge of music and the arts, and was a good linguist and a ready writer. His history of the navy has received high commendation from both European and American military critics. He was a man of medium height, and possessed of immense strength; this he turned to good account when on several occasions he was attacked by roughs during his early life. Few men could stand before him. His voice was low, pleasing, and well modulated, and the fine lines of his face and figure enhanced his charms of manner and conversation. He was always popular with the reliable element among both his officers and men, who would follow him under all circumstances to any destination. During his residence in Washington, while he was admiral of the navy, no house was more eagerly sought than his, and no one dispensed hospitality with a more lavish hand or a more agreeable effect. He left a widow (the daughter of Commodore Daniel T. Patterson), two daughters, and four sons. He was given a grand military funeral, when the President and Cabinet and representatives of both services united to do honor and pay the last tribute of respect to one of the greatest naval commanders of this or any other age. He is buried at Arlington among the nation's dead. His published works are: "Life of Commodore David Porter" (1875); "Allan Dare and Robert le Diable," a romance (1885); "Incidents and Anecdotes of the Civil War" (1885); "Harry Marline" (1886); and "History of the Navy in the Rebellion" (1887).

PORTUGAL, a monarchy in southern Europe. The legislative power is vested in the Cortes Geraes, consisting of the House of Peers and the House of Deputies. The upper house, under the law of July 24, 1885, abolishing life peerages, when this law goes into complete operation will consist of 100 peers appointed for life by the King, of the 50 elective peers, who are chosen indirectly, and of the peers who still hold seats by virtue of birth or office, viz., princes of the blood royal and the 13 continental bishops. There were 52 hereditary peers still living in 1891. The members of the popular Chamber are elected for four years by the direct suffrage of Portuguese citizens of full age who are fathers of families or have an income of 100 milreis and can read and write. There are 168 Deputies for the Continent and the Azores and Madeira, and 12 for the colonies. The reigning King is Carlos I, born Sept. 28, 1863, son of Luis I and Pia, daughter of Vittoria Emanuele. He married Marie Amalie, daughter of Philippe of Orleans, Count of Paris, in 1886, and succeeded to the throne at the death of his father, on Oct. 19, 1889. The Cabinet formed on Oct. 12, 1890, was composed as follows: President of the Council and Minister of War, João Chrysostomo de Abreu e Souza; Minister of the Interior and Minister *ad interim* of Public Instruction and Fine Arts, Antonio Candido Ribeiro da Costa; Minister of Marine and the Colonies, Antonio Ennes; Minister of Commerce, Agriculture, Industry, and Public Works, Thomas Ribeiro; Minister of Finance, Mello Gouveia, who retired and was succeeded by Augusto da Cunha; Minister of Justice, Correo da la Brandão; Minister of Foreign Affairs, Barbosa Bocage.

Area and Population.—The area of continental Portugal is 32,528 square miles, and of the Azores and Madeira or Funchal 1,510 square miles. The population in 1881 was 4,708,178. There are a large number of gypsies in Portugal, and in the coast towns about 3,000 negroes. In the south there is a considerable admixture of Jewish and Arab, and of Dutch, French, and English blood. The number of marriages in 1888 was 34,097, against 34,323 in 1887; the number of births was 163,963, against 165,914; the number of deaths was 107,455, against 108,552. The number of emigrants was 16,923 in 1887, and 23,981 in 1888.

Finances.—The ordinary receipts for 1887-'88 were 39,731,254 milreis (the milreis = \$1.15), the extraordinary receipts were 1,109,185 milreis, and there was a surplus brought down of 7,702,863 milreis, making the total receipts 48,543,302 milreis. The ordinary expenditure amounted to 38,244,042 milreis, and the extraordinary to 6,003,714 milreis, making a total of 44,247,756 milreis, which left a surplus of 4,295,546 milreis. In four years about 22,000,000 milreis of new debts had been made. In 1888-'89 no sums were raised by credit, while the receipts fell to 37,891,835 milreis, and at the same time the ordinary expenditures of 39,165,358 milreis was supplemented by 11,526,273 milreis of extraordinary expenditure, making the total expenditure 50,681,631 milreis. In the revised budget for 1889-'90 the receipts from all sources were set down as 50,860,000 milreis, and the expenditures as 51,311,132 milreis. At the beginning of 1890-'91 the funded debt was 533,316,612 milreis, in addition to which 45,910,000 milreis had been raised by treasury warrants in the preceding four years, and there was a floating debt of 24,832,159 milreis. In 1890 a loan of 9,300,000 milreis was obtained in Paris, and treasury bills were issued to the amount of 16,500,000 milreis. The revenue for 1890-'91 was estimated at 40,962,694 milreis from ordinary sources, and the ordinary expenditure at 42,861,117 milreis, in addition to which 2,506,500 milreis were required for extraordinary purposes. In the budget for 1891-'92 the total revenue is estimated at 42,967,468 milreis, of which 7,157,400 milreis are derived from direct imports, 3,957,000 milreis from registration and stamped paper, 23,505,800 milreis from indirect taxes, 2,155,500 milreis from supplemental duties, 4,072,012 milreis from government property, and 2,119,750 milreis are *recettes d'ordre*. The total expenditure is estimated at 46,822,072 milreis, of which 27,742,818 milreis are for the Ministry of Finance, 1,285,240 milreis for the Ministry of the Interior, 1,007,564 milreis for the Ministry of Worship, 5,294,046 milreis for the Ministry of War, 2,537,444 milreis for the Ministry of Marine and the Colonies, 485,240 milreis for the Ministry of Foreign Affairs, 4,711,234 milreis for the Ministry of Public Works, 1,417,721 milreis for the Ministry of Public Instruction and the Fine Arts, 62,465 milreis for the Savings Bank, and 2,278,300 milreis for extraordinary purposes.

The Army and Navy.—The law of 1884 makes the peace establishment consist of 24 regiments of infantry, 12 of chasseurs, 10 of cavalry, 3 of mounted artillery, 1 brigade of mountain artillery, 1 regiment and 4 batteries of fortress artillery, and 1 regiment of engineers. The

soldiers, who are recruited in part by conscription and in part by enlistment, serve in the active army three years. The number of men to be maintained is fixed from year to year by the Cortes. The peace effective for 1891 of the permanent army was 2,089 officers and 25,658 men, with 3,985 horses and mules. There were, in addition, 79 officers and 2,176 men in the municipal guards, and 178 officers and 4,791 men in the fiscal guards. The war effective is estimated at 4,000 officers and 150,000 men, with 23,000 horses and 264 guns. About half of these are trained soldiers. There are maintained, in addition to the home army, the colonial forces, which number 8,880 officers and men, exclusive of the native troops.

The fleet, in 1891, consisted of 1 armored corvette of 3,200 horse-power, carrying 9 guns; 6 corvettes, having a total of 48 guns; 24 gunboats, with 76 guns; 5 torpedo boats; 2 armed transports; and 3 other steamers, besides 13 sail vessels. The navy in 1891 had 256 officers and 4,360 sailors, besides 400 in the colonies.

Commerce.—The special imports of merchandise in 1890 were in total value 44,423,593 milreis, and the special exports 21,536,299 milreis. The imports of precious metals were 14,534,500 milreis, and the exports 10,538,825 milreis. The values of the principal articles of importation were as follow: Cereals, 3,991,000 milreis; machinery and instruments, 3,443,000 milreis; cotton goods, 3,145,000 milreis; iron, 2,512,000 milreis; coal, 2,096,000 milreis; woollens, 2,085,000 milreis; sugar, 2,030,000 milreis; raw cotton, 1,892,000 milreis; railroad material, 1,784,000 milreis; codfish, 1,747,000 milreis; chemicals, 1,453,000 milreis; wool, 1,436,000 milreis; animals, 1,421,000 milreis; timber, 1,151,000 milreis; hides and skins, 1,142,000 milreis; silks, 1,116,000 milreis. The chief exports and their value were: Wine, 10,898,000 milreis; cork, 3,114,000 milreis; fish, 1,016,000 milreis; copper, 1,016,000 milreis. Minor articles of export are animals, figs, and onions.

Navigation.—There were 3,720 steamers of 4,932,000 tons, and 2,390 sailing vessels of 356,000 tons, entered in 1890, exclusive of coasting vessels. The departures numbered 3,701 steamers of 4,922,000 tons, and 2,680 sailing ships of 354,000 tons. The merchant navy, not including small coasting and fishing vessels, contained 67 steamers of 108,601 metric tons, and 486 sailing vessels of 101,711 metric tons.

Railroads, Posts, and Telegraphs.—There were 2,149 kilometres of railroads in operation and 155 kilometres under construction on Jan. 1, 1891. The Beira Baixa Railroad, in the construction of which through the mountains great engineering difficulties were overcome, was opened on Sept. 5, 1891. The postal traffic in 1889 was as follows: Domestic letters, 19,965,000; international letters, 5,185,000; postal cards, 3,907,000; printed matter, 22,118,000 pieces; money transmitted by letters or orders, 3,466,000 francs. The state telegraphs have a total length of 5,606 kilometres, with 13,011 kilometres of wire. The number of internal dispatches in 1887 was 628,329, and of foreign dispatches 477,117. The receipts from the postal service were 5,707,477 francs, and from the telegraphs 1,035,797 francs.

Military Revolt.—A Republican faction called the Federal Group Union, having for its aim the establishment of a federal republic embracing the Iberian peninsula, encouraged by Spanish Republicans who pursue the same idea, took advantage of a feeling of discontent bordering on insubordination that existed among the non-commissioned officers of the army to incite a part of the Oporto garrison to revolt on Jan. 31, 1891. The petty officers were dissatisfied because the law for the advancement of men from the ranks to officers' grades was defeated by the conferring of all the commissions on graduates of the military schools. The smallness of their pay afforded another grievance. Several of them had been punished or reduced to the ranks for manifesting their discontent. In communication with the Federal Group, a large number of sergeants agreed to start a mutiny in the garrisons, which was to be the signal for the proclamation of the republic and a civil insurrection. Though the Republicans are numerous and influential, they are not harmonious. The leaders of the important groups had nothing to do with the revolutionary plot. The Government got wind of it, and was able to take measures in time to prevent a rising in all the towns except Oporto, where the movement originated. In the early morning of Jan. 31 the Ninth Regiment of chasseurs left its barracks and went to a camping-ground, where it was joined by the Tenth Infantry, led by Capt. Leitao and Lieut. Coelho, and by a regiment of the fiscal guards and 150 of the foot guards. They marched together, after breaking into the barracks of the Eighteenth Infantry to enable mutineers in that regiment to join them, to Praco Dom Pedro, their numbers being swelled by large crowds of civilians. Taking possession of the town hall, they constituted a provisional government, composed of Dr. Alves de Veiga, Rodrigues Freitas, Gen. Correia da Silva, Azevedo Leite, and Pinto Leite. The loyalty of the municipal guards prevented them from getting possession of the city before troops could arrive from Lisbon. When the guards fired on a body of insurgents many fled in terror, while others fought bravely until they were dislodged. A larger force of insurgents made a second attempt to ascend the Rua San Antonio, in order to seize the palace of the civil governor and cut the telegraph wires. They were driven back, and while the municipal guards and the loyal part of the Eighteenth Regiment picketed various streets, the rebels occupied the municipal palace. The municipal guards surrounded the building, which was bombarded for two hours and nearly destroyed by a brigade of artillery which arrived with two cannons, after which the municipal guards made a bayonet charge and overpowered the defenders in a desperate fight. Returning with their prisoners to the barracks, they had another fight with the insurgent guards within. The disturbance began at three in the morning and was quelled before four in the afternoon. There were 50 killed and over 200 wounded during the *émeute*. The "Republica Portuguesa," organ of the Federal Republicans, was confiscated, the other Republican papers of the country were suppressed, and all Republican and Socialist clubs were closed. The mutinous regiments were disbanded. Mar-

tial law was proclaimed, to enable the civilian participants in the rising to be tried by court martial. More than 200 sergeants were implicated. The proceedings began on Feb. 25. There were about 502 soldiers tried and 22 civilians. Dr. de Veiga, the political leader, escaped to France. Capt. Leitao, Lieut. Coelho, Verdial, Souza, Santos Cardozo, and João Chazas were sentenced to solitary confinement from two to six years, followed by transportation from six to ten years. All the sergeants were sentenced to four years' cellular imprisonment and six years' transportation. On April 9 the arrest of some law-breakers, who were supposed by the populace to be Republicans, was followed by a riotous outbreak that could only be suppressed by a bayonet charge of the soldiery.

Financial Crisis.—The Government of Portugal, owing to party rivalries and revolutionary dangers, abstained from imposing fresh taxes to meet the growing expenses, and borrowed money constantly for current needs, until the public debt amounted to more *per capita* than that of Great Britain, and the interest charges consumed half the public revenue. The total indebtedness rose from about \$400,000,000 in 1875 to nearly \$700,000,000 in 1890, an advance from \$87 to \$135 *per capita*. For this there was little to show except the 505 miles of Government railroads, 780 miles of heavily subsidized railroads belonging to companies, and the costly new harbor at Lessa, which is unsafe. The competition of German manufactures compelled Portuguese factories to close; severe agricultural distress was felt; the banks were drained of their cash reserves for payments abroad and advances to the Government and to the railroads, the receipts of which had greatly fallen off; the returns from investments in Brazil, on which Portugal usually relies for the money to carry on the commercial operations at home, were suddenly stopped by the Brazilian crisis; socialistic, agrarian, and Republican agitation confronted the Government and disturbed confidence; the treasury was bankrupt unless relief came from abroad, and the money market of London, which had helped the Government out of former difficulties, was closed by the Anglo-Portuguese dispute, while Berlin bankers showed no disposition to come to the rescue. In 1890 an attempt was made to float a loan in Paris, which was defeated by certain holders of bonds of the usurping Government of Don Miguel, repudiated after the restoration of Donna Maria, who demanded full payment, and raised a public outcry against lending to a country that had defrauded Frenchmen. In December a strong group of Paris bankers made an arrangement by which 75,000,000 francs were advanced, and afterward Senhor Carvalho, acting as agent for the Government, made new terms with them, by which they agreed to raise the authorized loan of 250,000,000 francs on the security of the tobacco monopoly, which the Portuguese Government promised to transfer to a board of managers composed of Frenchmen and Portuguese. As the monopoly brings in 22,500,000 or 25,000,000 francs a year, there would be an excess of about 8,500,000 francs to be covered into the Portuguese treasury. The syndicate offered to buy off the Miguel bondholders by giving 2,500,000 francs

for their worthless bonds. The 75,000,000 francs were used to pay off the most pressing of the floating obligations and to relieve the banks. The Cortes were convoked on Jan. 2, but were adjourned till April 2 after hearing the King's speech, in which the ministers promised to consolidate the floating debt by means of the 75,000,000 francs, without having recourse to further credit operations, and to arrive at a financial equilibrium by measures of economy so as to avoid the imposition of fresh taxes. The gravity of the financial situation was not apparent even to the ministers, who expected to establish the finances on a sound basis by the operation concluded in Paris, and who were preoccupied with the dispute with Great Britain, which had caused a change of ministry at every stage of the negotiations, and with the Republican agitation. Before the Cortes met some of them foresaw a monetary crisis, and asked to be strengthened by the admission of men whose influence and standing would strengthen the Cabinet and help to terminate the dispute with Great Britain, and to revive confidence in the national credit. In the middle of April the Minister of Public Works and the Minister of the Interior offered their resignations, but were induced to remain. The subscriptions for the tobacco loan were opened in April, and the amounts taken by French and German bankers gave the ministers fresh courage. But bear speculators and Republicans attacked the new loan, causing the price to drop from 430 to 350 francs for 500-franc bonds, and rumors of the bankruptcy of the Government and the credit institutions of Portugal caused people to withdraw their deposits from the banks in gold. Men thrown out of work by the stoppage of factories the Government offered to transport with their families to the colonies in Africa, and to find work for them there. On May 8 a run on the banks was begun, against which such a precaution was futile. The Banco Lusitano, which had already exhausted its resources by coming to the assistance of the Royal Portuguese Railroad Company, closed its doors on May 10. The Government came to the aid of the other banks by issuing a decree authorizing the redemption of notes in silver, and ordering the coinage of 2,000,000 milreis. This proved unavailing, and on May 11 a *moratorium*, or general suspension of payments, but not of accruing interest, for sixty days was decreed for the relief of banks, companies, and individual debtors.

Change of Ministry.—On May 15 the Cabinet resigned in a body after arranging the basis of a convention with Great Britain that was highly honorable for Portugal, since Lord Salisbury, impelled by a fear that the English people, who have many millions invested in Portugal and are the chief holders of the debt, would not justify his contentions, and that British diplomacy would lose more than it would gain if he precipitated the political chaos and financial ruin that would follow the overthrow of the Portuguese dynasty, abandoned his claim to the region of the middle Zambesi (see CAPE COLONY). Count San Januario was called upon to form a mixed Cabinet, but abandoned the undertaking because he could not get the Conservatives and Progressists to agree on the question of elections. Serpa

Pimental failed in an attempt to organize a ministry, and the King sent for the retiring Premier, who succeeded on May 21 in getting one together which was composed as follows: President of the Council and Minister of War, Gen. João Chrysostomo d'Abreu e Sousa; Minister of Foreign Affairs, Count de Valbom; Minister of the Interior, Lopo Vaz; Minister of Finance, Marianno Carvalho; Minister of Justice, Moraes Carvalho; Minister of Marine and the Colonies, Julio de Vilhena; Minister of Public Works, Franco Castellobranco. Four of the ministers were Conservatives, or *Regeneradores*, and the rest were Progressists. The programme of the new Cabinet consisted in a liberal and tolerant policy: the commutation of sentences passed on political offenders, greater liberty of the press, the reduction of the number of officials and lowering of salaries, and the conclusion of commercial treaties to stimulate trade and production. The colonies were to be opened to chartered companies, thus increasing their productive capacity and relieving the home Government of heavy expenses. Senhor Carvalho went immediately to Paris, where he arranged for the payment of the coupons of the debt due in July, October, and January. The price of Portuguese *vente* rose. The minister obtained the means for continuing the harbor works at Lisbon on a less ambitious scale, and rescued from bankruptcy by inducing the directors to abandon the controlling interest that they had secured in three Spanish railroads, and making a large secret advance to them of Government funds, concealing even from his colleagues this transaction. The Portuguese investments in Brazil, amounting to \$550,000,000, were still depreciated by 33 per cent. through the fall in exchange, but the large hoards of gold, estimated at \$67,500,000, began to return to circulation, and bank notes were taken more freely, relieving slightly the monetary stringency. The Cortes reassembled on May 30. The issue of small notes was authorized, and the export of silver coin was prohibited. The English treaty was ratified without cavil. A loan of \$8,000,000 was authorized for the purchase of silver for ordinary currency. A Government monopoly of alcohol was approved, and the sale of watches and lotteries were made monopolies, and from these sources an increase of revenue of 2,000,000 milreis was expected to be realized. The extraordinary expenditure for 1891-'92 was fixed at 2,240,000 milreis. The effective of the army was reduced to 22,000 men, and 3,000 recruits were dismissed to their homes. All payments of state officials by fees were abolished, and the maximum salary was fixed at 2,600 milreis, even for officials filling more than one place. The tobacco bonds signed for, but for which the Portuguese banks could not pay, were taken by French banking houses. The monetary crisis not being over when the *moratorium* expired on July 10, the Bank of Portugal, which had authority to issue bank notes to the amount of about \$30,000,000, was absolved for three months longer from the obligation to redeem its notes in money. The recall of troops from Africa on the conclusion of the English treaty permitted a reduction of the army by 8,000 men, saving 3,000,000 milreis a year. The transfer of sovereign rights in East Africa to chartered companies was expected to

save 700,000 milreis; and an increase of about 300,000 milreis in the revenue from Guinea and Angola was obtained by a revision of the tariffs.

Colonial Possessions.—The Portuguese colonies in Asia, comprising Goa, Domao, and Diu, in India, Macao, in the China Sea, and the Indian Archipelago of Timor and Kambing, have a total area of 7,923 square miles, and a population of 881,000. The possessions in Africa are the Cape Verde Islands, 1,650 square miles in extent, with 110,926 inhabitants in 1885; the Guinea protectorate, 14,200 square miles in extent; St. Thomas's and Prince's islands, 454 square miles in area, with a population of 21,037; Angola, Ambriz, Benguela, Mossamedes, and the Portuguese Congo, having an aggregate area of 501,500 square miles, and an estimated population of 19,400,000; and the state of East Africa, 300,000 square miles in extent, with about 1,000,000 inhabitants. The total ordinary revenue is estimated in the colonial budgets for 1891-'92 at 3,784,809 milreis, the ordinary expenditure at 3,910,105 milreis, and the extraordinary expenditure at 785,080 milreis. The imports of Angola in 1888 were valued at 2,405,569 milreis, and the exports at 2,116,487 milreis; imports of Cape Verde at 214,650 and exports at 301,791 milreis; imports of Guinea at 21,087 and exports at 51,004 milreis; imports of St. Thomas at 823,643 and exports at 275,621 milreis; imports of Goa at 24,839 and exports at 28,445 milreis. The imports of Mozambique in 1890 were £141,493 in value, and the exports £90,374; while at Delagoa Bay the value of the imports was £613,805, and of the exports £2,211. The chief exports of the East African colonies are oil, nuts and seeds, caoutchouc, and ivory. There were 208 kilometres of completed railroad, 370 kilometres under construction, and 428 kilometres of telegraph line in Angola in 1891; in East Africa there were 88 kilometres of railroad completed, 689 kilometres projected, and 370 kilometres of telegraphs; in India there were 82 kilometres of railway and 53 kilometres of telegraphs. The troops in the colonies consisted of 1,193 regular officers and soldiers and 8,283 colonial troops of the first line. The Delagoa railroad dispute was referred to Switzerland for arbitration as to the indemnity to be paid to the American and English *concessionnaires*. The Government decided to have the road completed by private contract. In West Africa a dispute arose concerning the railroad from Loando to Ambaca, which an English construction company undertook to build. The Portuguese company which acquired the concession annulled the contract, and the contractors, who had constructed a part of the line, claimed damages. The natives of the Bissagos islands, off the coast of Portuguese Guinea, rose in rebellion against the authorities in the early part of 1891, overpowered and massacred the garrison, and hoisted the French flag. Troops sent from the mainland against the rebels, who numbered 6,000, were defeated, 4 Portuguese officers and several hundred native levies being killed, and a stronger force had to be brought from Angola to re-establish Portuguese authority. The delimitation of the boundary between British and Portuguese territory in Manica, East Africa, was carried out by a joint commission. The agreement for the delimitation of the spheres of Portugal and of

the Congo State in Munto Yamvo, signed on May 23, 1891, was approved by the Cortes.

PRESBYTERIANS. I. Presbyterian Church in the United States of America.—

The comparative summary of the statistics of this Church for the past five years, as published by the stated clerk of the General Assembly, gives the following results:

	1887.	1891.
Synods.....	23	30
Presbyteries.....	201	216
Ministers.....	5,654	6,223
Number of ruling elders.....	21,881	24,475
Number of deacons.....	7,085	7,880
Churches.....	6,496	7,070
Added on examination.....	53,886	59,650
Total communicants.....	697,885	806,796
Number of adults baptized.....	20,114	21,576
Number of infants baptized.....	28,469	26,121
Members in Sunday school.....	771,821	888,680
<i>Contributions:</i>		
Home missions.....	\$75,070	\$995,625
Foreign missions.....	669,891	784,406
Education.....	117,898	154,518
Sunday-school work.....	39,487	131,915
Church erection.....	286,687	860,944
Relief fund.....	110,939	116,573
Freedmen.....	103,404	124,814
Aid for colleges.....	127,627	161,920
Sustentation.....	26,419	63,117
General Assembly, etc.....	62,324	75,449
Congregational.....	7,902,164	9,764,879
Miscellaneous.....	866,762	1,326,696
Total.....	\$11,095,622	\$14,062,856

The Board of Home Missions reported to the General Assembly that its total receipts for all purposes had been \$957,907. Its permanent funds amounted to \$225,590. It supported 1,677 missionaries and 340 missionary teachers, who returned a total church membership in the mission stations of 113,420, with 156,262 in the congregations, 10,683 added on profession of faith, 2,452 Sabbath schools with 178,169 members, and 438 Sabbath schools organized during the year. One hundred and thirty-nine churches had been organized. In the educational department were 36 schools among the Indians, 34 among the Mormons, 30 among the Mexicans, and 18 in the South, which returned in the aggregate 340 teachers and 7,932 pupils. The Woman's Executive Committee had received \$338,847. The committee had secured pledges from societies and individuals of \$66,000 for the support of 140 mission teachers, and of \$56,000 for 717 scholarships in the various schools.

The Board of the Church Erection Fund had received \$126,642. Applications had been made during the year for aid to 190 churches and 52 manses, in the total sum of \$145,113. Appropriations had been made for 173 church buildings and 42 manses in the amount of \$116,550. One hundred and seventy-four churches and manses had been completed without debt, securing property to the amount of nearly \$400,000.

The total receipts of the Board of Publication in its Sabbath-school and Missionary Department for its current fund had been \$97,352. It presented reports of 7,117 Sabbath schools, with 947,337 members. The accounts of the Publication House were balanced at \$659,817.

The receipts of the Board of Education had been \$106,600. Its invested permanent funds amounted to \$75,280, and had yielded an income

during the year of \$4,410. The number of candidates aided had increased from 839 to 869.

The income of the Board of Relief had been \$155,154. It had upon its roll the names of 659 families relieved by it.

The Board of Aid for Colleges and Academies had received \$89,303, and reported that \$57,084 besides had been given directly to its institutions. It had paid \$15,287 of debts on property. The 15 colleges and 21 academies under its care returned \$1,173,278 of property, and 3,858 students, 152 of whom had the ministry in view.

The Board of Missions to the Freedmen had received \$155,078. Its invested funds amounted to \$53,820. The colored people had given during the year toward the support of the Church \$45,581. There were connected with the board 14 white and 120 colored missionaries, and 52 white and 168 colored teachers. Seven new churches had been organized, making the whole number now under the care of the board 252, with 17 missions in addition; 1,296 members had been received on profession of faith; and three were now 15,486 communicants, with 18,212 pupils in 259 Sunday schools. There were 84 schools for instruction in all elementary branches, with 197 teachers and 11,029 pupils.

The Board of Foreign Missions had received \$942,690. The receipts of the women's boards and societies had been the highest ever reached by them. The missions among the Seneca, Nez Percé, and Dakota Indians, in Mexico, Guatemala, United States of Colombia, Brazil, Chili, West Africa, India, Siam, China, Japan, Corea, Persia, and Syria, and among the Chinese and Japanese in the United States returned in all 210 American and 366 native ministers as missionaries, 388 American and 1,055 native lay missionaries, 377 churches, 28,494 communicants, with 2,875 additions during the year, 605 schools, with 27,813 pupils, 25,926 pupils in Sabbath schools, 160 students for the ministry, and \$49,423 of contributions by the native churches.

General Assembly.—The General Assembly met in its one hundred and third annual session in Detroit, Mich., May 21. The Rev. Prof. W. H. Green, of Princeton Theological Seminary, was chosen moderator. The Committee on the Revision of the Westminster Confession made a report embodying an account of its proceedings, a draft of the changes it recommended to have made in the Confession, and an explanation of the principles by which it had been governed in proposing them. The draft of the changes presented the modified articles in full as they would read after the alterations were made. The changes proposed are numerous, and include verbal alterations, the elimination of phrases with or without the substitution of others, the omission of single articles, and the insertion of new articles and new chapters. Those of most general interest are the ones that embody modifications of forms of doctrinal expression.

Among them are the incorporation in the chapter "On the Holy Scriptures" of a clause asserting the truthfulness of the history and the faithful witness of prophecy and miracle; a recasting of the chapter "On God's Eternal Decree," with the omission of parts of it, the insertion before the words "but to ordain them to dishonor" of the words "not to elect to everlasting life" and the addition of the words "yet so as thereby neither is any limitation put upon the

offer of salvation to all upon condition of faith in Christ, nor is restraint laid upon the freedom of any one to accept this offer"; the new reading in the chapter "Of Creation," "the heavens and the earth, with all that they contain, were made by him in six creative days"; in the chapter "Of the Fall of Man, of Sin, and the Punishment thereof," the reading "Opposite to all that is spiritually good," and the addition of the words, "Nevertheless, the Providence of God and the operations of His spirit restrain unregenerate men from much that is evil, and lead them to exercise many social and civil virtues"; the reading in the chapter "Of God's Covenant with Man," "offereth by his Word and Spirit"; the insertion of new chapters entitled "Of the Work of the Holy Spirit" and "Of the Universal Offer of the Gospel"; in the chapter "Of Free Will," instead of "altogether averse from that good," the new reading "altogether indisposed to that good," and the addition of the words, "Yet is his responsibility as a free agent not thereby impaired"; in the chapter "Of Effectual Calling" the modified readings "who is altogether passive in the act of regeneration, wherein," and "All infants (for elect infants) dying in infancy, and all other persons who, from birth to death, are incapable of being outwardly called to the ministry of the Word, are redeemed by Christ and regenerated by the Spirit, who worketh when, and where, and how he pleaseth"; also, "Yet inasmuch as they never truly come to Christ they can not be saved; neither is there salvation in any other way than by Christ through the Spirit, however diligent men may be in framing their lives according to the light of nature and the law of that religion they do profess"; the omission in the chapter "On Justification" of the words "they have, not of themselves, it," so that the clause shall read "which faith is the gift of God"; the insertion in the chapter "Of Good Works" of the words "and while their neglect of such things is sinful and displeasing unto God," before the words "Yet because they proceed not from a heart purified by faith"; the reading in the chapter "Of Religious Worship and the Sabbath Day," "Prayer is to be made for all things lawful; for the forgiveness of all sins except the sin unto death; and for all sorts of men living or that shall live hereafter; but not for the dead"; the reading in the chapter "Of the Church," "There is no other head of the Church but the Lord Jesus Christ, and the claim of the Pope of Rome to be the vicar of Christ and the head of the Church Universal is without warrant in Scripture or in fact, and is a usurpation dishonoring to the Lord Jesus Christ"; in the chapter "Of Church Censures" the insertion of the words in italics, so as to make the reading, "whereof they have *ministerial and declarative* power respectively to retain and remit sins." Modifications were also proposed in the language of certain clauses referring to the Roman Catholic Church, its doctrines and practices.

The report was accepted, to be sent down to the presbyteries for their action and the consideration of the next General Assembly in the light thereof. The Committee on the Subject of a Consensus Creed reported that it had addressed a letter to the several Reformed Churches throughout the world holding the Presbyterian system, inviting them each to appoint a committee of correspondence, with a view to the consideration and preparation "of a short creed containing the essential articles of the Westminster Confession, to be used as a common creed of those churches—not as a substitute for the creed of any particular denomination, but to supplement it for the common work of the Church." The Committee on the Proof Texts of the Confession of Faith and the Larger Catechism reported, submitting the collation of texts which it had made, and recommended, in view of the

pending consideration by the Assembly of the subject of revision of the Confession, that it be continued.

The standing Committee on Theological Seminaries reported upon overtures from 63 presbyteries which had been referred to them concerning the utterances of the Rev. Charles A. Briggs, D. D., contained in the address which he delivered on the occasion of his induction into the chair of Biblical Theology in the Union Theological Seminary, New York (see below). Some of the presbyteries recommended specific action on the part of the Assembly, but the majority of them invited, in general terms, such action as the Assembly might deem it best to take. The committee found that the General Assembly had authority to veto the appointment of professors in the Seminary, but must exercise its right at the next session after the appointment is made. It was resolved, by a vote of 440 to 60,

That in the exercise of its right to veto the appointment of professors in the Union Theological Seminary, the General Assembly hereby disapproves of the appointment of the Rev. Charles A. Briggs, D. D., to the Edward Robinson professorship of Biblical Theology in that seminary by transfer from another chair in said seminary.

A committee was appointed to confer with the directors of the Union Theological Seminary in regard to the relations of the seminary to the General Assembly.

The Committee on Church Unity reported, and upon its recommendation was discharged from the further consideration of the subjects of interdenominational comity and Church unity; and its name was changed to the Committee on the Federation of the Protestant Denominations of the United States. It was decided that the seal of the General Assembly should bear an open Bible as its central symbol. Upon hearing the report of the committee appointed to canvass the votes on the overture respecting deaconesses, which had been submitted to the presbyteries by the General Assembly of 1890, stating the facts recited in the resolution, the Assembly resolved that, whereas some presbyteries had answered the overture as a whole, and some had answered its proposed amendments as if they were two independent overtures, in its judgment the overture was defeated in both its amendments; but whereas the answers seemed to indicate a desire to secure godly and competent women to assist in deaconesses' work, and readiness to invest persons of this class with official character, and in view of the difficulties with which the subject was environed and of prevailing differences of opinion, a committee was appointed to consider the subject and ascertain from the answers already given, as far as possible, the desire of the Church, and to prepare an overture to be presented to the next General Assembly. Attention was called to the declarations of past General Assemblies on the subject of worldly amusements; a warning was uttered against progressive euchre, social dances, and private theatricals as new forms of the amusements therein condemned; and in general terms the Assembly called upon all members of the Church "so to regard their obligations to Christ as to see to it that they take no part in amusements which they can not take in his name."

The organization of young people's societies for Christian culture and work was commended. The disposition prevalent in the denomination to work for temperance within the lines of the Church was approved; members were urged to make their lives a quiet rebuke to any evil indulgences fostered by fashion; the efforts of the Christian women of the country in behalf of temperance were commended; and a representation was ordered sent to the United States Senate in favor of the participation of the United States in joint action by the powers against the traffic in slaves and liquor in Africa. A proposition favoring an exhibit at the Columbian World's Fair of the influence of religion on civilization was approved of; and a request was ordered made of the directors of the fair that they decide at once that its doors shall not be opened to the public on Sunday.

The Case of Prof. Briggs.—The address of Prof. Charles A. Briggs, which formed the subject of the most earnest debates in the General Assembly, was delivered by him on the occasion of his installation into the Edward Robinson professorship of Biblical Theology in the Union Theological Seminary, New York. This was a new professorship which had been founded and endowed by the Hon. Charles Butler. Prof. Briggs, who had for many years occupied the chair of Hebrew in the same seminary, was chosen to fill it, and was installed into it on Jan. 20. After making the subscriptions required of professors in Presbyterian seminaries, and receiving the charge, he delivered an address on "The Authority of the Scriptures," of which he furnished a syllabus to the public journals.

In this address he affirmed that historically there are three great fountains of divine authority—the Bible, the Church, and the reason. The majority of Christians have from the apostolic age found God through the Church. Other means used by God to make himself known were defined as the forms of reason, the metaphysical categories, and conscience and the religious feeling. There are those who would refuse rationalists a place in the company of the faithful, but they forget, the speaker held, that the essential thing is to find God; and if these men have found God without the mediation of the Church and the Bible, Church and Bible are means, not ends; they are avenues to God, not God. The speaker regretted that these rationalists depreciate the means of grace so essential to most of us, but we are warned lest we commit the same error, and depreciate reason and the Christian consciousness. Protestant Christianity builds its life and faith on the divine authority contained in the Scriptures, and is charged with too often depreciating the Church and reason. Men are influenced by their temperaments and environments which of the three ways of access to God they pursue. As obstructions which have been thrown up by the follies of men to each of these avenues, Prof. Briggs spoke of traditions, formalities in phrase and expression, and views of doctrine which, having become habitual and crystallized, have been invested with erroneous meanings and need to be discarded or modified. Of a true biblical theology, the most prominent feature is theophany. The institutions of the Old Testament religion become for all ages and for all men the appropriate symbols of the universal religion. The God of the Bible is one God—a Being high above the best scheme of philosophical theism and the most skillful constructions of the systematic theologian. The favorite divine attribute of the Old Testament and the New is the attribute of

mercy, with love transcending human powers of conception. The doctrine of man in the Bible is a divine doctrine, presenting sinful man in the midst of an original innocence and an ultimate perfection, with sin as only a temporary condition. Redemption is born of the love of God. As taught in the Bible it aims to remove all the ills that flesh is heir to; it comprehends the whole process of grace; it is a fault of Protestant theology that it limits redemption to this world. "Progressive sanctification after death is the doctrine of the Bible and the Church. The bugbear of a judgment immediately after death and of a magical transformation in the dying hour should be banished from the world, and we should look with hope and joy for the continuance in the process of grace and the wonders of redemption in the company of the blessed to which we are all hastening"; the biblical redemption is the redemption of our race. "The Bible does not teach universal salvation, but it does teach the salvation of the world and of the race of man; and that cannot be accomplished by the selection of a limited number from the mass." There is ample room for criticism in the ethical precepts and in the conduct of the holy men of the Bible. But the greatest sin against the Bible has been the neglect of the ethics of Jesus. The Messiah is the culmination of the Old Testament. The exposition of the theology thus briefly outlined closed with a demonstration of the harmony of all the sources of authority.

The Presbytery of New York, with which Prof. Briggs's direct ecclesiastical relations lie, in April, 1891, appointed a committee to consider his inaugural address in its relation to the Confession of Faith and the action it would be proper to take upon it. The committee reported in May, comparing the expressions of the address with the doctrinal statements of the Confession, and recommending that the committee enter at once upon the judicial investigation of the case. This report was adopted, with the resolution recommending investigation as against a minority report advising that no judicial proceedings be entered upon. The board of directors of the seminary addressed a list of questions to Prof. Briggs framed with a view of testing his doctrinal soundness on the particular points involved; upon receiving his replies to which, the Directors declared

That this board has listened with satisfaction to the categorical replies rendered by Dr. Briggs to the questions submitted to him, and that it trusts that the manner in which he has therein dealt with the points that are in dispute will operate to correct the misapprehensions that are current and to quiet the disturbing condition of mind in which, as a communion, we are so unhappily involved.

Prof. Briggs's associates in the faculty of the seminary published a statement in which, while they recognized and deprecated the dogmatic and irritating character of his utterances in his inaugural address and other writings, they averred that they did not recognize, even in these, any warrant for persistent misrepresentations of his views, and for the style and temper in which, they said, in many cases, he had been assailed; and they proceeded to show that the expressions objected to could be explained consistently with orthodoxy and the Westminster Confession. At a special meeting held after the action of the General Assembly, on June 5, the board of directors resolved that, after having taken legal advice and after due consideration, they saw no reason to change their views on the subject of the transfer of Dr. Briggs, and felt

bound, in the discharge of their duty under the charter and constitution of the seminary, to adhere to the same.

II. Presbyterian Church in the United States (Southern).—The following is a summary of the statistical returns of this Church as made to the General Assembly in May. The summary for 1887 is added to show the growth of the church in five years:

ITEMS.	1887.	1891.
Synods.....	13	18
Presbyteries.....	69	71
Candidates.....	267	371
Licentiates.....	57	66
Ministers.....	1,116	1,186
Churches.....	2,336	2,453
Churches organized.....	39	81
Ruling elders.....	6,931	7,679
Deacons.....	5,070	5,863
Added on examination.....	12,145	11,024
Total communicants.....	159,398	174,065
Adults baptized.....	4,214	8,853
Infants baptized.....	5,090	5,300
Baptized non-communicants.....	84,163	85,363
Teachers in Sunday schools.....	12,021	18,972
Pupils in Sunday schools.....	98,806	117,419
<i>Contributions:</i>		
Sustentation.....	\$42,944	\$57,574
Evangelistic.....	42,434	75,772
Invalid fund.....	11,921	15,398
Foreign missions.....	67,204	105,368
Education.....	39,250	44,778
Publication.....	9,081	9,211
Colored evangelization.....	4,152	8,938
Church erection.....	80,057
Bible cause.....	4,592
Presbyterial.....	18,754	14,865
Pastors' salaries.....	616,533	717,860
Congregational.....	453,977	619,273
Miscellaneous.....	114,015	114,590
Total.....	\$1,415,818	\$1,517,335

The Committee on Education of the Ministry reported to the General Assembly that it had received during the year \$21,461, and had aided 229 candidates. The Tuscaloosa Institute for colored ministers had been attended by 21 Presbyterian and 2 Methodist students—smaller numbers than in the preceding year. The decrease was due to the facts that better opportunities were provided elsewhere for the education of colored ministers, and that stricter rules of attendance had been imposed at the institution.

The Committee of Publication had received for benevolent work \$10,816, and in royalties from Sabbath-school papers \$3,093, while the net income from the publishing house had been \$2,455. The concern was valued at \$85,295 over all liabilities. Fifteen colporteurs had been employed, and had distributed \$8,807 worth of books.

The Committee of Home Missions had received \$79,842. Aid had been given, in the Sustentation department, in 221 cases; in the Church Erection department, in the erection of 32 buildings; from the Evangelistic fund and in Indian missions, in the support of 64 ministers, for 1 woman missionary to the Indians, and for 2 teachers at the Male Orphan Academy in the Choctaw nation where 56 orphans are cared for; from the Invalid fund, to 154 cases; and from the colored Evangelistic fund, in the support of Tuscaloosa Institute, and in the support of 1 white and 31 colored ministers and evangelists. There were now 4 colored presby-

teries, with 22 ministers, 36 churches, and perhaps 1,000 communicants, and several licentiates and Sabbath schools. The General Assembly declared that it was the deliberate and settled policy of the Church to aid in the establishment and development of a separate and ultimately self-sustaining colored Presbyterian Church.

The Committee of Foreign Missions had received \$112,951. Twelve new missionaries had been sent out, and 19 were under appointment. The missions were in Brazil, Japan, China, Mexico, the Congo Free State, and Turkish Greece. The churches of the mission in Greece proper had become part of the Evangelical Church of Greece.

General Assembly.—The General Assembly met at Birmingham, Ala., May 21. The Rev. H. C. Du Bose, D.D., was chosen moderator. The *ad interim* Committee on the Directory of Worship reported the result of its labors in the revision of that book, and it was sent down to the presbyteries for adoption or rejection. The committee appointed by the General Assembly of 1890 to invite the representative bodies of other churches to unite in petitions to the civil governments of the world to settle international difficulties without arms reported progress. Many of those bodies had yet to meet for the first time after receiving the invitation. Many of the bishops of the Protestant Episcopal Church had replied approving of the movement, and saying that they would lay the overture before their respective diocesan conventions. The Southern Baptist Convention had adopted the petition and appointed a delegate to the conference. Favorable answers had been received from the Methodist Episcopal Church and the Congregational Union of England and Wales. The action of the General Assembly in 1890 on temperance having been misunderstood by some persons, a new resolution was adopted declaring that the Church bore testimony against the traffic in intoxicating liquors as a fruitful source of abounding iniquity and misery, and advising the people to use all means which might be approved by their Christian consciences and judgment to remedy the evil throughout the land. Especially would it urge members to abstain from intoxicating liquors as a beverage. A pastoral letter was ordered sent down to all the churches calling attention to the evil of Sabbath desecration by travel, driving, social visiting, and excursions for pleasure on Sunday by members, and urging them "to such observance of God's holy day as becomes His people." The following minute was adopted concerning the participation of women in public services:

It is the settled doctrine of our Church that women are excluded from licensure and ordination by the plain teaching of the Scriptures, and therefore can not be admitted to our pulpits as authorized preachers of the Word; and also that they are prohibited from speaking by way of exhortation or leading in prayer or discussing any question publicly in the meetings of the church or congregation as a mixed assembly. This is according to the mind of the Spirit as expressed by St. Paul in I Cor. xiv, 34, 35, and I Tim. ii, 11, 12. But we do not hold that Christian women are prohibited from holding meetings among themselves for mutual edification and comfort by pious conversation and prayer, or to devise ways and means to aid the general branches of Church work, such as

home and foreign missions, etc., or to teach a class in the Sabbath school. Work of this kind we approve and commend, but public speaking in the promiscuous assembly of the congregation or church is contrary to the holy oracles, and therefore should be prohibited and condemned by the presbyteries and Church sessions.

The Assembly declared it unlawful to grant the use of church buildings to Universalists for holding religious services.

III. United Presbyterian Church in North America.—The following is a comparative summary of the statistics of this Church for 1860 and 1891:

ITEMS.	1860.	1891.
Presbyteries.....	43	59
Pastors and stated supplies.....	834	531
Total ministers.....	447	782
Ministers ordained.....	80	80
Students of theology.....	85	73
Ruling elders.....		3,578
Total congregations.....	674	902
Pastoral charges.....		717
Mission stations.....	101	170
Members received on profession.....	3,778	7,482
Total members.....	52,781	106,885
Infants baptized.....	4,340	4,054
Adults baptized.....	575	1,713
Number of Sabbath schools.....		1,027
Officers and teachers.....		10,408
Pupils.....		93,848
Contributions of Sabbath schools.....		\$11,403
Ladies' missionary societies.....		844
Young peoples' societies.....		524
Salaries of ministers.....	\$159,401	\$521,250
Average salary of pastors.....		\$1,018
Contributions for—		
Congregational purposes.....		\$347,467
The boards.....	\$38,522	\$211,502
General purposes.....	\$59,391	\$65,738
Number of churches.....		815
Seating capacity.....		263,805
Value.....		\$5,036,764
Number of parsonages.....		220
Value.....		\$445,172

The receipts of the Board of Church Extension were reported as \$28,711; the payments to congregations had been \$38,589. Appropriations had been made to 24 congregations and missions to the amount of \$41,332. During the past ten years the amount paid by the board for churches and parsonages, exclusive of contingent expenses, had been \$304,592, an average of \$34,459 a year. The Board of Education returned 59 beneficiaries. There were in the colleges 65 instructors and 1,058 students.

The receipts of the Board of Home Missions had been \$56,442, and the expenditures \$60,639. Aid had been granted to 219 stations, of which 207 stations reported an average attendance of 16,527 persons, 12,538 communicants, 1,244 additions by profession of faith, and 1,432 teachers and 15,428 pupils in Sabbath schools. The receipts of the Board of Foreign Missions had been \$105,116. From the missions in Egypt and India were returned 26 ordained, 33 other foreign workers, 260 native laborers (in Egypt), 39 organized and 164 unorganized stations and congregations, 9,828 communicants, 145 schools with 10,347 pupils, 201 Sabbath schools with 7,559 pupils; in India, 410 additions by profession of faith, 392 baptisms of adults and 291 of infants, and a total Christian population of 10,171.

The General Assembly met in Princeton, Ind., May 26. The Rev. T. J. Kennedy, D. D., Presi-

dent of Amity College, Iowa, was chosen president. A committee appointed by the previous General Assembly concerning the relations of this Church with the Presbyterian Alliance reported recommending a resumption of them; whereupon the Assembly resolved that, as assurances had been given by the Secretary of the Alliance "that any departure from the use of the Scripture Psalms in the devotional meetings thereof was not by its authority, and that such departure will be carefully guarded against in the future meetings," it declared its desire to be readmitted to the Alliance. It declined to take any part in the preparation of a consensus of the faith of the Presbyterian churches of the world, on the ground "that it is not wise to do anything that might indicate a willingness to modify our creed." A minute adopted on the subject of the demission of the ministry declares

That every one who rightfully occupies the ministerial office has been called to that position by the voice of Christ, the Head of the Church; and that ordination by the presbytery is an official act, setting a man apart to the office to which it is judged the Lord has called him. The evidences on which a presbytery bases its judgment are the possession of natural, acquired, and gracious endowments, fitting the candidate for the office; leadings of Providence guiding him in that direction; and a persuasion apparently wrought in the man's soul that he is called of God to this office. It is possible that the man may be mistaken in his conviction concerning the call of the Lord, and a presbytery may also be mistaken in its judgment of the matter, "so that a man may come into the ministry by the mistakes of man, and not by the will of God." Or, a man who has been called by the Lord for a time may become by some providence—not of old age or infirmity—entirely and permanently unfitted for the duties of his office, while left free to serve the Lord in those duties for which he is capable. In such cases the presbytery may release the man from his act. But when unfitness results from the minister's neglect to cultivate his talents or his yielding to the allurements of the world, he can not properly be released without censure.

As a part of a course of evangelistic training, a Bible institute was provided for the benefit of members of the Church desiring to fit themselves for Christian labor, the course of instruction in which shall embrace the English Bible, the plan of salvation, the distinctive principles of the United Presbyterian Church, and methods of Christian work. In view of the usual omission of the name of Christ from the official proclamations appointing Thanksgiving Day, the Assembly directed the preparation of a special proclamation, recognizing the Thanksgiving Day appointed by the President, to be read from the pulpits of the Church in place of the President's proclamation. Petitions were ordered sent to the directors of the Columbian Fair for the entire closing of the exhibition on Sunday.

IV. Reformed Presbyterian Church (Synod).—The following is a summary of the statistics of this body as they were reported to the Synod in May: Number of congregations, 127; of ministers, 123; of elders, 503; of deacons, 347; of communicants, 11,272; average attendance in Sabbath schools, 13,011; number of baptisms during the year, 363. Amount of contributions: For foreign missions, \$26,151; for home missions, \$6,559; for the Southern Mission, \$3,962; for the Chinese Mission, \$2,037; for the Indian Mission, \$4,521; for sustentation, \$2,596; for national reform, \$4,520; total

contributions, including congregational and other, \$216,407. The Synod held endowment funds to the total amount of \$244,043.

The Synod met in Pittsburg, Pa., May 27. The Rev. R. C. Wylie was chosen moderator. The report of the Committee on the Signs of the Times included a review of the growth of the Synod and its enterprises since 1871, when the covenant was adopted throughout the whole Church. The number of members had increased from 8,868 to 11,289 in 1890, or 27 per cent.; and the total amount of contributions had risen from nearly \$170,000 to nearly \$240,000, or 41 per cent. Every work in which the Church was engaged in 1871 was still prosecuted with unabated zeal and over an extended area, while the new missions among the Chinese and among the Indians had been added. The invested funds of the Synod, which amounted in 1871 to less than \$50,000, were reported in 1890 to be more than \$241,000. The case of six ministers who had been suspended by the Presbytery of Pittsburg for violation of the discipline of the Church came before the Synod on appeal. The specific offense with which these ministers were charged was that of having signed, in July, 1890, a paper called the "East End Declaration," in which it was held that "persons who make a credible profession of Christ should be received into church fellowship on the acceptance of our testimony and terms of communion without binding them to our explanation in the matter of political dissent and other questions"; and this after the Synod had directed that there should be no more agitation on the subject. The ministers, both when on trial before the Assembly and on the presentation of their appeal, declared that they had not purposed to be disorderly or to violate the law of the Church forbidding its members to vote in civil elections, but only favored a change in the law of the Church. The Synod, in the case of five of the ministers, refused to entertain the appeals, and dismissed them. In the case of the sixth minister the appeal was sustained. A number of the members of the Synod protested against this action and declared that they would leave the Church. The Synod resolved to co-operate with the Southern Presbyterian and other churches in the address of a memorial to the governments of Christendom in behalf of the cause of peace, and committed its members to a personal pledge, that if any part of the Columbian Exhibition were opened on the Sabbath they would not attend it, would not give it countenance or support, and would use their influence to persuade all Christian people to unite with them in like practical protest against "such a national dishonoring of the Sabbath and of the Lord of the Sabbath."

V. Reformed Presbyterian Church. (General Synod).—The General Synod of the Reformed Presbyterian Church met in Philadelphia, May 21. The Rev. William H. Gailey was elected moderator. Report was made of the condition of the foreign mission in India with stations at Roorkee, Muzaffarnagar, and Puttiala. The amount of the Church Extension fund was returned at \$4,933. The receipts and expenditures of the Disabled Ministers' fund had been \$487, while other sums had been sent directly

by different churches to the beneficiaries. The total permanent investment, including the Endowment and Lamb funds, amounted to \$55,474. A minute was adopted with reference to the difficulties in the Reformed Presbyterian Synod, to the effect that

Anything affecting the interests of theological education in the Reformed Presbyterian Church enlists our consideration. Events occurring among our former brethren, acting under the same name, we fear, justify us in expressing regret that so many defections have occurred among our graduates, and that so many of theirs have been silenced by suspension from exercising their ministry. It is gratifying to find that there are so many among them in sentiment with us. We would desire to hope that the reunion for which our fathers prayed and hoped was near at hand.

A protest was adopted against opening the Columbian Exhibition on Sunday.

VI. Cumberland Presbyterian Church.—The General Assembly met in Owensborough, Ky., May 21. The Hon. E. E. Beard, of Lebanon, Tenn., was chosen moderator. In reply to an overture from the Presbyterian Church (North) inviting it to join in the preparation of a consensus creed of the Reformed Churches holding the Presbyterian system, a declaration was adopted:

1. That while the Cumberland Presbyterian Church has the "Presbyterian system," it does not accept the "Westminster Confession" or its creed.

2. That thus standing, it is willing at all times to enter into correspondence with other Churches holding the "Presbyterian system" in any effort to unite upon a short creed to be used as the common creed of these Churches.

A committee was appointed to enter into correspondence with other Presbyterian committees with a view to the consideration and preparation of such a creed "provided that nothing contained in the creed to be thus proposed shall conflict with the Confession of Faith of the Cumberland Presbyterian Church," with the additional stipulation that the action of the committee should have no binding force or effect till it was approved by the General Assembly. To a communication inviting it to join in asking the political conventions to insert a recognition of Jesus Christ in their platforms, the Assembly resolved that it was not expedient for the Church to interfere directly in politics. Majority and minority reports were presented on the question of "rotation in the office of elders," or the election of elders for terms of years, the majority report declaring against rotation, and the minority report in favor of it. The majority report was adopted. A declaration was approved that a woman can not legally be elected a ruling elder. The report on Temperance condemned all license, and declared that the legalized liquor traffic has its existence because of the will of the people expressed at the ballot-box, and can be outlawed by the will of the people expressed at the polls, and that Cumberland Presbyterians ought not to exercise their privileges as citizens in such a way that their votes shall be inconsistent with their prayers. The report on the Sabbath included a protest against opening the Columbian Exhibition, or any part of it, on Sunday. The receipts of the Board of Missions had been: For foreign missions, \$22,259, of which \$10,169 had been contributed through the

Woman's Board; for home missions, \$11,450; total receipts, including those for Church erection and other receipts, \$43,871. The mission at Osaka, Japan, had 16 missionaries (men and women), 16 native laborers, 10 churches with 623 communicants, 1 school with 100 pupils, and returned 63 additions. The mission in Mexico returned 2 stations, 4 missionaries, 3 native helpers, 1 church with 9 members, and 3 schools with 198 pupils.

VII. Presbyterian Church in Canada.—The statistical returns of this Church, as presented to the General Assembly in June, show that the number of churches and stations under pastoral supply was 1,769, or 151 less than in the preceding year; of sittings in churches, 461,520; of families connected with congregations and stations, 83,389; of single persons not connected with families in congregations, 14,439; of communicants, 160,102, showing an increase of 2,112; of additions during the year on profession of faith, 10,128; attendance on Sabbath schools, 127,890. Total income of the Church, \$2,002,810, with \$59,483 in addition raised on the mission stations. The contributions for home missions amounted to \$30,000 in the eastern section and \$111,988 in the western section. Services were held in 1,056 stations, in which 12,569 Presbyterian families were represented, besides others not connected with the Church. One hundred and ninety-three congregations had been aided by the Augmentation fund to the extent of \$33,786 in raising the salaries of their pastors to not less than \$750 per annum. The income of the French Evangelization fund had been \$58,000. Its work, including colportage, mission schools, preaching stations, and regularly organized churches, had been done chiefly in the Province of Quebec, but extended also to portions of the maritime provinces, Ontario, and St. Anne, Ill. Ninety-three stations were served. The receipts for foreign missions, including the balance from the preceding year, had been \$87,186, in addition to which the woman's foreign missionary societies had provided \$40,000. Missions were in operation in the New Hebrides, Trinidad, China, and Central India, and among the Indians in the Northwest. The Mission Committee had \$8,000 on hand for the foundation of a mission to the Jews, and recommended that steps be taken at once to establish such a mission in Palestine.

General Assembly.—The General Assembly met in Kingston, Ontario, June 10. The Rev. Thomas Wardrope, D. D., of Guelph, was chosen moderator. The returns from the presbyteries of their votes on the overture prescribing that "the discipline of the Church shall not be exercised in regard to marriage with a deceased wife's sister or a deceased wife's niece," showed that the overture had been defeated. The Assembly declared upon this that "the matter should now take end." An overture providing that students in Presbyterian colleges be allowed to prosecute their studies during the summer season was sent down to the presbyteries. Regulations were adopted concerning the course of instruction in the colleges, one of the provisions of which contemplates a service of one year in the mission field before settlement of the candidate. The report on temperance asserted the

conviction of the Assembly "that in the matter of legislation nothing short of prohibition rigidly enforced by the proper authorities should ever be accepted as final or satisfactory, and that it is the duty of the Dominion Parliament to enact such a law." The Assembly further approved of temperance organizations in the Church similar to that working in the Church of Ireland, and directed that local church authorities see that the principles of temperance are properly advocated in the public schools. The value of Young People's or Christian Endeavor societies was discussed, and the Assembly resolved "that in order to develop their Christian graces the young people be thoroughly organized for Christian work." The subject of a "consensus creed" was referred to a committee composed of the delegates appointed to attend the Presbyterian Council. The report of the Committee on Civil and Religious Rights recommended that to counteract the effects of the growth of ultramontaniam, the people everywhere should be educated in both secular and religious matters to think and act for themselves as the Christian law requires; and ministers should take frequent occasion to instruct their people on this subject, and inform them fully regarding "ultramontane errors." Respectfully acknowledging the receipt of a memorial on the labor question, the Assembly expressed sympathy with every wise effort "to develop the faculties of man, to improve his social conditions, to redress injustice, and to effect needed reforms," and, trusting that any evil in the condition of different classes of the community might as far as possible be met and removed, expressed the conviction that they could only be permanently met and removed by the application of the principles of the Gospel of Christ.

VIII. Free Church of Scotland.—The General Assembly met in Edinburgh, May 22. The Rev. Prof. Thomas Smith was chosen moderator. The Committee on the Confession of Faith reported that it had determined that the best plan of procedure in the case was to consider a declaratory act, and accordingly reported such a bill, which declares, in substance,

That in holding and teaching the divine purpose of grace, the Church earnestly proclaims as standing in the forefront of the revelation of grace the love of God—Father and Son and Holy Spirit—to sinners; that all who hear the Gospel are warranted and required to believe to the saving of their souls; that the Confession is not to be held as teaching that any who die in infancy are lost, or that men are foreordained to death irrespective of their own sin; or that man's whole nature is so corrupt but what there remain "tokens of his greatness as created in the image of God."

A minute was adopted that

The Assembly approve generally of the report, and return their thanks to the committee, especially to the convener. They approve of the proposed form of a declaratory act, and resolve to send it down to presbyteries as an overture under the Barrier act. . . . The General Assembly have seen with satisfaction that the Committee on the Confession of Faith, after repeated conference, have been led to adopt unanimously a resolution in regard to holy Scripture. The Assembly approve of the resolution, and, regarding it as reasonable and fitted to be helpful, they adopt it as their own as follows, viz.: The General Assembly find that there appears to be no adequate

call to add a declaratory statement to the clear and comprehensive exhibition of the doctrine of holy Scripture contained in the first chapter of the Confession. At the same time, in view of the anxiety expressed in regard to the Church's position on this subject, the Assembly cordially avail themselves of the opportunity of recording their full and steadfast adherence to the doctrine laid down in the Confession as to the great truths of the inspiration, infallible truth, and divine authority of holy Scripture as proceeding from God, who is the author thereof.

The Committee on the Quinquennial Visitation of Colleges reported that representations had been made to the visitors at the New College of the manner in which the classes in natural science and evangelistic theology were conducted, and on examination they had concluded that inquiry was needful. Similar representations in reference to the chair of Evangelistic Theology were made to the visitors at Glasgow and Aberdeen, and inquiry was found needful also at those schools. Complaint was likewise made of the principal at Glasgow. Among the particular matters mentioned in the complaint was the allegation that the complainants left the hall (at Glasgow), "after attending the classes of the Professor of Old Testament Exegesis, without hearing in these of the existence of the great problems raised by modern criticism in that department, and wholly unable to deal with them, and almost untaught in the interpretative criticism of the text." A special commission of seven ministers and seven elders was appointed to make a full and deliberate inquiry into these statements, and report to the next Assembly. Upon the presentation of the report of the Committee on Church and state, a resolution was adopted, declaring

That the Assembly are still persuaded that the termination of the connection of Church and State now existing in Scotland is essential in order to the attainment of the results which are desired, and while they deeply regret any sentiment of estrangement which meanwhile may arise in connection with the frank and free expression of opinion on this head, they are constrained to declare their judgment that a just, honorable, and permanent settlement can not be obtained on other terms.

The committee was reappointed.

To overtures asking for a more definite expression by the Assembly with reference to the case of Profs. Dods and Bruce (see "Annual Cyclopædia" for 1890), the Assembly replied that they "do not deem it necessary to take any further action in reference to the matters referred to in the overtures, and accordingly pass from them." A report was adopted favoring more extended co-operation with the United Presbyterian Church, particularly in the matter of avoiding competition in movements for church extension. The Assembly voted to petition Parliament

To devote a portion of the funds accruing to Scotland as Scotland's equivalent to the grant made in behalf of the relief of fees in English schools, to the completion of the relief of fees in the elementary schools, to the improvement and extension of the secondary and technical school system, and to the better equipment of the universities.

The subject of improving congregational music was referred to a committee, which was also empowered to entertain any proposal for co-operation with other Presbyterian churches with

the view of promoting uniformity in the hymnals in use in the different churches. The subject of preparing a manual of prayer for use in family worship was also referred to a committee.

The total receipts for foreign missions had been £94,385. Including 35 agents of the ladies' societies and 33 missionaries' wives, the number of missionaries employed in India, Arabia, Syria, Africa, and the New Hebrides was 165, and the whole number of Christian workers was about 800. The number of native communicants was 6,895. Six hundred and ninety-six adults and 731 children had been added to the mission churches, and the catechumen classes returned 1,788 members. Six colleges and 307 schools returned 27,951 pupils of both sexes. The older vernacular missions had been reorganized, and evangelistic and medical work had been extended from new centers.

IX. Church of Scotland.—The General Assembly of the Established Church of Scotland met in Edinburgh, May 22. The Rev. James MacGregor, D. D., of Edinburgh, was chosen moderator. The Aged and Infirm Ministers' Committee reported that annuities amounting to £3,218 had been paid to about 40 annuitants. The income of the Colonial Committee had been £4,648. The income of the Jewish Missions' Committee had been £5,752, showing a slight falling off. The contributions for the work of the Committee on the Highlands and Islands had been £1,869, and the expenditures upon it £1,752.

A memorial signed by more than 450 ministers, seven of whom were Professors of Theology, asking that steps be taken to frame measures that would do away with the evils arising from competitive preaching in connection with the present method of selecting ministers, was referred to a committee to consider and report upon to the next General Assembly, with the understanding that the Assembly had no desire to interfere with the statutory right of the people to choose their own ministers. A report on the conduct of public worship and the sacraments recommended that the order of sequence for worship be indicated by the Assembly; that the use of the Lord's Prayer at every service be enjoined; that a table be prepared of readings and blessings, embracing every day of the year, for public worship; that sitting at prayer be disapproved of; that baptisms, except on special occasions, be public; that a burial service be sanctioned for use at the house and the grave; and that an optional liturgy be prepared for public worship and the sacraments. This report was recommitted, in order that its recommendations might be matured and put into shape. A petition for the institution of an inquiry into the right of the Glasgow University to allow Prof. Max Müller to lecture there on religion, or to entertain lectures on the Gifford foundation (which provides for lectures on the natural evidences of religion without preference for any system), was not entertained. A petition was presented from the Layman's League on the subject of increased co-operation among the Presbyterian churches in Scotland. The concurrence and sympathy of the Assembly with the objects and constitution of the League were expressed, and the Committee on Church Interests was authorized to receive, consider, and re-

port to the General Assembly any practical proposals toward reunion and the reconstruction of Scottish Presbyterianism which may be communicated to it.

X. United Presbyterian Church of Scotland.—The Synod met in Edinburgh, May 3. The Rev. Dr. Andrew Henderson, of Paisley, was chosen moderator. The condition of teaching and doctrine in the college hall was a prominent subject considered. Complaint having been made by the students of the inefficiency of one of the professors, a committee appointed at the preceding meeting of the Synod to inquire into the matter had taken the opportunity to examine the work of the college as a whole. The work of the principal was approved. In the professorship of Hebrew the committee suggested that the work might be widened, and more satisfaction given in teaching students to deal with those problems in recent discussions that must be fairly and intelligently and reverently dealt with. The complaints made by the students had borne chiefly against the teaching from the chair of the New Testament Exegesis; and this the committee found had been faulty from excess of merely grammatical comment, with insufficient treatment of the scope and purpose of the New Testament writings; absence of a regular course of instruction in New Testament introduction; incomplete statement and defective treatment of the special difficulties arising from modern criticism; besides some faults in detail and method. The College Committee was authorized to report to the Synod all complaints affecting the teaching of heresy within the college, and, in the event of its being decided that there was a case that demanded inquiry, to begin such processes as might be thought necessary.

The report on disestablishment renewed the testimony of the Synod in favor of religious equality, and expressed the conviction that union of the Presbyterian churches of Scotland could be effected only on the basis of freedom from State connection and support. The report on Sabbath observance mentioned the spreading tendency to secularize the day by fashionable entertainments and Sunday concerts, and the practice of ministers of traveling on Sunday by train or other hired conveyances to meet their appointments, as painful indications of disregard for the Lord's day. It had been found impossible to obtain, even among members of Parliament friendly to Sabbath observance, one who would introduce a bill for the diminution of Sabbath postal labor. An overture was received from a presbytery of Cape Colony in reference to extending missionary work into the new sphere of British influence extending north to the Zambesi.

The income of the Foreign Missionary Society for the year had been £32,303, and its expenditure £30,806. The report showed that the number of missionaries had gradually increased from 42 in 1860 to 63 in 1870, 80 in 1880, and 117 in 1890; and while the number of native congregations in 1860 was 35, with 4,695 members, it was now 96, with 15,799 members. In 1860 the native contributions amounted to £2,662, and in 1890 to £13,005. In 1860 there was 1 native minister, and in 1890 there were 20.

XI. Presbyterian Church in Ireland.—The statistical reports of this Church show an increase for the year of 57 communicants, 1,272 families, 1,196 stipend payers, 297 pupils in Sabbath schools, 11 ministers, 9 licentiates, and 1 student. The total income of the Church had increased from £222,626 to £239,188, or by £16,562. Ten thousand pounds sterling had been added to the Sustentation Fund. Reports were made to the General Assembly from the foreign missions in India and China, the Jewish, Continental, and colonial missions, and the Irish Home Mission. The capital of the Aged and Infirm Ministers' fund had been raised, by the aid of the Jubilee fund, to nearly £7,000.

The General Assembly met in Belfast, June 1. The Rev. N. M. Brown, D. D., was chosen moderator. The provisional arrangement made in 1886 concerning the use of instrumental music in church services having expired by limitation of five years, the subject again claimed attention. This arrangement provided that while congregations which already had instruments should be permitted to continue to use them, no more instruments should be introduced. The committee to which the subject was referred reported that the working of the arrangement had been satisfactory, and that while instruments had been disused in some congregations, none had been added. In accordance with the recommendation of the committee, the compact was renewed for another five years. The principles of temperance were represented as making a solid advance in the Church, with an exhibition of greater energy in promoting them, as well as an increasing number of abstainers, and a growing sentiment in favor of a closer restriction of the liquor traffic.

XII. Presbyterian Church in England.—The statistical reports of this Church, as presented to the Synod in May, show the number of members to be 65,688; of pupils in Sunday schools, 79,282, with 7,373 teachers; value of church property, £1,508,629. The income of the Church was returned at £239,284, against £234,805 in 1890.

The Synod met in London, April 27. The Rev. J. Monro Gibson, D. D., was chosen moderator. The Committee on the Confession of Faith, which had in the previous year asked the Synod to approve a revision of the articles of Faith (see "Annual Cyclopædia" for 1888), now presented for approval a draft of an appendix to the same, dealing with parts of the Confession—such as those relating to worship and baptism—which could not be defined as doctrine. A new formula was offered, to be signed by ministers and licentiates, requiring assent to the "body of doctrine" contained in the Confession, as set forth in the new articles of Faith. The appendix was referred to the presbyteries. A communication from the American General Assembly suggesting the preparation of a consensus creed was referred to the Committee on the Confession of Faith. A report was sent down to presbyteries giving to the presbytery authority, subject to appeal to the Synod, in case of inefficiency or unsuitability of ministers, after exhausting ordinary means of remedy, to dissolve the pastoral tie. With it was sent an overture arranging for visitation of congregations.

XIII. Welsh Calvinistic Methodists.—The statistical secretary of this denomination presented to the General Assembly a comparative review of the condition of the Church for several years past, partly in answer to assertions that had been made during the debates concerning disestablishment that the nonconformist churches in Wales were declining. So far as could be ascertained, the census returns showed an increase in the population of England and Wales during the past ten years of 11·54 per cent. The increase in the number of full members of this denomination was 14·40 per cent. The number of communicants in 1880 was 118,970; in 1890 it was 136,051, showing an average annual increase of 1,701. The increase for 1890 was 1,812, or 111 above the annual average. The total collections for 1890 were £202,707, while in 1880 they were £141,174, and in 1870 £108,564.

The General Assembly met at Morriston, near Swansea, June 22. The Rev. William James was chosen moderator. A committee was appointed to prepare a reply in the name of the Assembly to attacks that had been made upon the connection.

XIV. Australian Federal Assembly.—The fourth Federal Assembly of the Presbyterian Churches in Australasia was held in Brisbane, beginning July 9. The Rev. Dr. James Scott, of Hobart, was chosen moderator. The statistical report showed that there were 417 ministers in New South Wales, where the proportion of adherents to the whole population was 1 to 10, with 13,830 children in Sabbath schools; in Tasmania, 19 ministers and 174 teachers in Sabbath schools; in South Australia, 14 ministers and 250 teachers; in Western Australia, 2 churches; in Queensland, 42 ordained ministers and 26 missionaries, with 4,200 adherents; in Victoria, 210 ministers, with 3,300 teachers, 32,000 young people attending the schools and classes, and 67,000 adherents. A revision of the Directory for Public Worship was approved. The subject of a revision of the doctrinal standards was discussed, but no action was taken upon it. Action was taken toward the incorporation of the Presbyterian churches of the several Australian colonies into one. Recommendations were adopted with regard to the better oversight and strengthening of the missions in the New Hebrides. A new mission was provided for to be established among the aborigines on the Batavia river, in northern Queensland.

PRINCE EDWARD ISLAND. This island, with its area of 2,133 square miles, is the smallest province in Canada. It is, indeed, smaller than the neighboring island signory of Anticosti, which is almost uninhabited. The little island province is nevertheless the most densely peopled of any part of the Dominion. Its population, by the census of 1891, was 109,088, being at the rate of 54 per square mile.

Government.—Upon the acceptance of the chief justiceship by the ex-Premier Hon. W. W. Sullivan late in 1889 a sequence of complications ensued. Hon. Neil McLeod succeeded the Chief Justice as Premier; but, through the adverse voice of the electors, he was compelled to resign in April, 1891. A new ministry was then formed as follows: Hon. Frederick Peters, Attorney-General (Premier); Hon. Angus McMillan,

Provincial Secretary, Treasurer, and Commissioner of Public Lands; Hon. James R. McLean, Commissioner of Public Works; and Hons. Peter Sinclair, Alexander Laird, James Richard, Lawrence Kickham, Donald Farquharson, and George Forbes, without portfolio. Upon the meeting of the House, on April 23, Bernard D. McLellan was elected Speaker, and the Assembly was opened by the Lieutenant-Governor, who said:

I have much pleasure in meeting you again, and in availing myself of the advice and assistance in such legislation as may tend to promote the interests of the province. Although the lateness of your meeting must be attended with inconvenience to you, I rely with confidence upon your devoting sufficient time to mature such measures as the exigencies of the province and its public service may require. I was pleased to observe last autumn that a decided improvement was manifest in the manner of conducting the provincial exhibition, and trust that the husbandmen of this province may derive benefit corresponding to the exertions of the Charlottetown Driving Park and Provincial Exhibition Association. It is a matter of regret that the comparatively short crop of last year was damaged to a considerable extent by heavy rains during harvest, and as a consequence feed for farm stock has been scarce during the winter.

The public accounts for the past year will be laid before you. It is a matter of regret that the expenditure has largely exceeded the revenue, and as a consequence the indebtedness of the Government to the banks has been increased to such an extent as to necessitate the adoption of prompt measures for its settlement. The estimates for the current year will be submitted to you. They have been framed with due regard to economy and the efficiency of the public service.

Measures will be laid before you having for their object the lessening of the expenditure of the province without impairing the public service.

Financial.—In accordance with this speech the public accounts show that the receipts from all sources during 1890 amounted to \$224,881·69, while the expenditure was \$305,799·39. Of this total, \$110,536·28 were expended upon public works, for the most part of a permanent character. The estimates of expenditure for 1891 were \$270,905. One item in these estimates provides in part for the survey of a tunnel railway which is projected between the island and the mainland, a project of incalculable importance to the former. The session of 1891, being the second session of the thirty-first General Assembly, closed on July 15.

PROTESTANT EPISCOPAL CHURCH IN THE UNITED STATES. As in previous years, so in the present (1891), this church has moved on in its usual appointed course. In the free use of its liturgy and authorized services it has increased in a steady, healthful manner. There have been no disturbances or excitements over doctrine or discipline, and the position of the Episcopal Church, relatively to other denominations of Christians, in matters wherein there is divergence of doctrine and practice, remains the same. Christian union of an organic character, though earnestly desired, is still felt to be something in the future. The Prayer Book, as well as the conduct of public services, with more or less of ritual and its accompaniments, have been freely discussed, and there are unanimous desire and purpose to have doubtful points cleared up and agreement entered into as to matters yet requiring settlement. As the Gen-

eral Convention is to be held in 1892, it is highly probable, if not certain, that the conservative, law and order abiding sense of the fitness of things will prevail everywhere. The sources of information in preparing this article are the published journals of conventions, reports, and documents of Church societies and corporations, Pott's "Church Almanac," and Whittaker's "Protestant Episcopal Almanac." The following table presents a summary of statistics of the Church during 1891:

DIOCESSES.	Clergy.	Parishes.	Baptisms.	Confirmations.	Communicants.

Domestic and Foreign Missionary Society.—The society which has this as its legal title comprehends all persons who are members of the Protestant Episcopal Church. The Board of Missions consists of all the bishops of the American Church, the members for the time being of the House of Deputies of the General Convention, the delegates from the Missionary Jurisdictions, and the Board of Managers. The Missionary Council comprises all the bishops, an equal number of presbyters, and an equal number of laymen. It meets annually (except in the years when the Board of Missions meets), and is charged with taking all necessary action in regard to the missionary work of the Church which shall not conflict with the general policy of the board. The Council met in Detroit, Mich., Oct. 20, and continued in session for three days. It was well attended by bishops, clergy, and laity, and disposed of matters in hand with promptitude and hearty zeal. The annual report of the Board of Managers, with accompanying documents, was received, and note was made of the fact that the board, its general secretary, the various commissions, and the Woman's Auxiliary had done their work well, and deserved the confidence and support of the Church. The Board of Missions divides its work between a domestic committee and a foreign committee, which have headquarters in New York city.

Domestic Missions.—From Sept. 1, 1890, to Sept. 1, 1891, there were: Missionaries (17 missionary jurisdictions and 34 dioceses): bishops, 13; other clergy (white, colored, Indian), 520; teachers, other helpers, etc., 100; total, 620. The financial condition was as follows: Cash in hand (September, 1890), \$35,372.59; offerings, etc., \$150,109; legacies for domestic missions, \$23,478.98; legacies for investment, \$1,950; specials, \$37,412.85; moneys withdrawn for temporary purposes, \$76,294.76; total, \$324,617.20. Expenditures (17 missionary jurisdictions and 34 dioceses): for whites, \$117,451.09; Indians, \$42,082.74; colored, \$47,396.42; specials, \$39,252.26; overdraft, \$23,906.85; salaries, rent, printing, etc., \$18,662.26; legacies for investment, \$1,950; balance in hand, \$33,215.03; total, \$324,617.20.

Foreign Missions.—From Sept. 1, 1890, to Sept. 1, 1891, the number of missionary bishops was 4; the number of other clergy (white and native), 69; teachers, physicians, helpers, etc., 283. The financial condition was as follows:

Cash in hand (September, 1890), \$13,743.71; offerings, general fund, etc., \$178,714.81; specials, \$16,003.42; moneys withdrawn for temporary investment, \$32,689.48; total, \$241,151.42. Expenditures on account of missions, etc., in West Africa, China, and Japan (including Hayti and Mexico), \$178,878.60; specials for China, Japan, Hayti, etc., \$17,856.32; salaries, rent, printing, and incidentals, \$19,362.63; balance in hand, \$12,212.01; total, \$241,151.42. The mission property at foreign stations is estimated to be worth about the same as previously reported, viz., in Africa (Monrovia, Cape Palmas, etc.), \$40,000; in China (Shanghai, Wuchang, Hankow, Peking), \$157,100; Japan (Tokio, Osaka, Nara), \$64,000; in all (about) \$261,100.

Woman's Auxiliary to the Board of Missions renders important and efficient aid in all the departments by means of parochial, city, county, and diocesan associations of ladies, formed for the purpose of raising money, preparing and forwarding boxes to missionaries and mission stations, and in various other ways giving help to the missionary work of the Church. Money raised by the Auxiliary for domestic, foreign, and other mission work, \$153,700.55; boxes for the same (3,972 in number), value, \$195,954.14; total, \$349,654.69.

American Church Missionary Society (also auxiliary to the Board of Missions) has employed during the year, in 22 dioceses and missionary jurisdictions, 46 missionaries. The financial condition was as follows: Balance in hand (September, 1890), \$26,374.80; for general work, domestic missions, \$13,306.78; for general work, foreign missions (Cuba and Brazil), \$11,258.98; specials, \$4,458.36; balance in hand (September, 1891), \$10,007.40; total, \$65,416.32. The Society holds in securities, trust funds, bonds and mortgages, and property, to the amount of \$150,000. It also sends boxes of clothing and the like to the missionaries in its employ.

Church Work in Mexico.—This is placed under the direct supervision and control of the presiding Bishop of the American Church, the constitution of the Mexican Church being temporarily in abeyance. The work is carried on by a superintendent, residing in the city of Mexico, who is to "counsel and guide presbyters and laymen there who have asked that the fostering care of the Church in the United States be extended to them as a mission." An advisory committee for the work in Mexico has in charge all offerings made through the Board of Missions. Clergy, 5; lay helpers, 13; mission stations, 27. There is also a "league in aid of the Mexican branch of the Church," consisting of ladies residing in New York city. This association contributes money and sends boxes, etc., independently of the arrangement that is set forth above.

Church in Hayti.—This Church, though properly independent, is not quite strong enough to be self-supporting, and consequently seeks aid from the Protestant Episcopal Church in the United States. A commission of bishops has it in charge, and it receives help from the Domestic and Foreign Missionary Society. Aid was extended this year to the amount of \$7,819.44. Statistics: Bishop, 1; other clergy, 14; teachers, catechists, etc., 37. Estimated value of Church

property in Port-au-Prince, Jérémie, Aux Cayes, etc., nearly \$20,000.

Protestant Episcopal Churches in Europe, on the Continent.—These, organized under the canon, are in charge of a bishop of the American Church, who makes an annual visitation. Churches in France, 2; in Germany, 1; in Italy, 2; in Switzerland, 3; clergy, 10; contributions, \$3,206; estimated value of Church property in Paris, Rome, Dresden, Geneva, etc., \$132,650.

American Church Building-Fund Commission.—It was established in 1880, and continues its very useful and important work. The aim of the trustees is kept steadily in view, viz., to bring the fund up to at least \$1,000,000, so as to be able to give effective aid in all parts of the United States toward building chapels and new churches. The progress is rather slow, having reached only to the amount of \$207,435.22; but the trustees are sure that, as the value of the fund to the cause of the Church becomes more widely and better known, it must and will receive large additions. During the year thirty-seven new loans were made, the whole number being at date 174, to the amount of \$111,262.72.

Society for Promoting Christianity among the Jews (auxiliary to the Board of Missions) reports its usual quiet and steady progress during this its thirteenth year of work. The society has missionaries laboring in nine or ten of the large cities. Besides the paid missionaries, the parochial clergy co-operate with the society in almost every diocese. There are four missionary day schools, four industrial schools, and three night schools. Of publications, over 46,000 copies were issued during the year, and Bibles, Testaments, Scripture portions, and Prayer Books were circulated in English, Hebrew, German, and other languages. Much good has been accomplished in removing Hebrew narrowness and prejudice to a large extent, and though conversions are not rapid, yet there is excellent ground for hope in the future. Contributions: Sunday-school offerings, specials, etc., \$10,781.44; balance from old account, \$5,244.80; total, \$16,026.24. Expenditures for schools, salaries, publications, etc., \$13,181.33; real estate account, \$1,175.80; balance to new account, \$1,669.11; total, \$16,026.24.

General Condition of Church Affairs.—During the year three of the bishops have died, viz.: Bishop W. J. Boone, of Shanghai, China; Bishop C. F. Knight, of Milwaukee; and Bishop B. H. Paddock, of Massachusetts. Four presbyters have been consecrated bishops, viz.: H. M. Jackson, assistant, of Alabama; D. Sessums, assistant, of Louisiana; Phillips Brooks, of Massachusetts; and I. L. Nicholson, of Milwaukee. Six are on the list of retired bishops, viz.: G. T. Bedell, T. A. Jagger, C. C. Penick, S. I. J. Schereschewsky, H. Southgate, and C. M. Williams. In addition to those above named, seventy-seven of the clergy have died during 1891, of ages varying from thirty to ninety years; average age, fifty to fifty-five years. In addition to the regular ordained clergy, sisterhoods, deaconesses, and women trained for special work, which they alone can properly perform, are doing good and laudable service, and they are blessed in the fruits of their labors.

Q

QUEBEC, PROVINCE OF. By the "British North America Act" Quebec is made a pivot province, and a medium for regulating the parliamentary representation of the other provinces. The number of members for Quebec in the House of Commons was fixed at 65. "There shall be assigned to each of the other provinces such a number of members as will bear the same proportion to the number of its population (ascertained at such census) as the number 65 bears to the number of the population of Quebec (so ascertained)."

This provision necessitates a redistribution of parliamentary seats in the Commons House immediately after each decennial census, the representation of the province of Quebec remaining still the same. By the census taken in the spring of 1891 the population of this province was 1,488,586, an increase over that of 1881 of 129,559. In this aggregate is included the city of Montreal, the largest in the Dominion, with a population of 216,650, increased within the decade by 61,413, or 39.5 per cent., and the city of Quebec, provincial capital, the third city in the Dominion, with a population of 63,090. This city is, next to Halifax, the strongest fortified place in America.

Local Revolution.—What follows can scarcely, with strict propriety, be included under the head of Finance. Early in 1891 a number of charges were boldly made against the Mercier provincial administration. Premier Mercier and some of his ministerial colleagues were alleged to have taken bribes from certain railway contractors and others, for sums amounting to hundreds of thousands of dollars—the exact amount may probably come under "the unknowable"—conditioned upon the fraudulent assignment to such contractors, at inflated prices, of contracts for the construction of the Bay Chaleur Railway and other provincial works. A man named Pacaud was represented to have been the go-between in arranging these thrifty transactions, "for a consideration"; while Mercier himself, as was alleged, had received a large share of the fund to pay the expenses of a visit to Europe. These allegations were so boldly and circumstantially made that it was deemed incumbent to provide for an investigation. A commission was appointed, it is believed through

the insistence of Lieut.-Gov. Angers, with that end. The commission proceeded to investigate, and at length issued a partial and incomplete report, which, so far as it went, was highly damnable to the provincial ministry. Upon this report, the lieutenant-governor considered it incumbent upon him to call upon his ministers to resign their portfolios, which not having been promptly done, he took upon himself the responsibility of dismissing them from office, and called upon Hon. C. E. De Boucherville to form a new ministry. From this it followed that, in the last days of the old year, the following new ministry was announced: De Boucherville, President of the Council and Premier; Flynn, Minister of Crown Lands; Pelletier, Provincial Secretary; Beaubien, Minister of Agriculture; Casgrain, Attorney-General; Hall, Provincial Treasurer; Nantel, Minister of Public Works; Taillon, Masson, and McIntosh, without portfolios.

This bold action of the lieutenant-governor, seemingly on his own sole responsibility, caused great excitement and the widest diversity of opinion. The ex-ministers and their copartisans were soon again startled from the same quarter, for as soon as the new Cabinet were sworn into office Gov. Angers issued a proclamation dissolving the Provincial Assembly, the elections for the new House to take place on the 8th of March ensuing. Meanwhile the contest raged with virulence. Mercier and his following fiercely charged the lieutenant-governor with gross violation of the Constitution, which nothing could justify. The new ministers and their supporters, while averring the contrary, further maintained that the gubernatorial prerogative justified his acts, and that the cause of morality made those acts imperative upon him. They declared that they were possessed of evidence of great frauds and peculations on the part of the Mercierites, of which the general public yet knew nothing, and a new royal commission of investigation was resolved upon by Lieut.-Gov. Angers.

In the general election, held on March 8, the result was a triumph of the policy of Lieut.-Gov. Angers and his new ministry. The returns show the election of 56 Government supporters, or Conservatives, and 17 supporters of Mercier, the ex-Premier.

R

RAIN, ARTIFICIAL. Rain-making, or attempted rain-making, is of prehistoric origin, and almost as universal as the human race. The familiar story of Elijah and the prophets of Baal may be cited to prove its antiquity, while Jupiter Pluvius and the other cloud-compelling deities of Greece and Rome are almost equally familiar. Every modern traveler has tales to tell of barbaric devices to propitiate the powers that are supposed to prevail in the upper air. The summer of 1891 was unique in this respect. The

Hindus were permitted by their British rulers to resume rain-making on their traditional lines, involving human torture and all but human sacrifice; the savage African lighted his bonfires and sang his rain-song as usual; the Indian medicine-man beat his drums and shook his rattles as of old; and the Government of a great civilized nation, for the first time in history, entered the arena with costly apparatus and undertook to accomplish on scientific principles what barbarians have long sought to do with such appliances

as they could command. Without entering into the discussion of questions that at best must be regarded as undetermined, a brief account of the undertaking is here given.

On motion of the Hon. Charles B. Farwell, Senator for Illinois, a resolution was introduced in the United States Senate appending a clause to the general appropriation bill for 1891 which provided that under the direction of the forestry division of the Department of Agriculture \$2,000 should be expended in experiments having for their object the artificial production of rainfall by means of explosives. Subsequently this sum was increased to \$10,000. There was some discussion in both Houses of Congress concerning the appropriation, but it appealed so strongly to that native sense of humor, which is so powerful an element in the conduct of American affairs, that it passed by a handsome majority, and R. G. Dyrenforth, of Washington, was appointed to superintend the expenditures. A corps of rain-makers was organized, including two balloonists (Carl Meyers and George E. Casler), E. Powers (author of "War and the Weather"), John T. Ellis, and other assistants. Mr. Dyrenforth elaborated a system of apparatus for firing heavy charges of high explosives, as well as ordinary gunpowder, at high elevations. The party left Washington in July, and on Aug. 5 reached the ranch of Nelson Morris, a few miles from Midland, Texas, a retired place where the intended explosions would not be attended by disaster, except, perchance, to the operators themselves. It was alleged that this was a particularly dry region, where little or no rain had fallen for several years. The party reached the ranch on Aug. 5, and were occupied for several days in preparing their complicated outfit, consisting of several dozen balloons, kites, retorts, and various chemicals. The apparatus likewise included an electrical outfit, which it was intended to use in firing the charges sent aloft or placed upon the ground. The official reports of the experiments, which extended over a period of nearly three weeks, represent them as resulting in complete success; but unofficial reports, emanating for the most part from spectators attracted by the unusual spectacle, and from newspaper reporters, do not altogether agree. The first explosions were on Aug. 9, and were of minor importance as regards strength. It is certain that a rain occurred on the next day; but as a natural and unprovoked rain had occurred on the day before, the experimenters did not claim any credit for the second downfall. Again, on the 18th, there were explosions, also followed by rain; these, however, were considered as merely preliminary, and it was not until the 20th that all the arrangements were completed for the final, and, as it was claimed, decisive test. The results appear to have been unsatisfactory for several days, even to Mr. Dyrenforth, but on Aug. 26 the conditions became favorable. According to a correspondent of the New York "World," "the night was beautifully clear, and not a cloud could be seen. The heavens were dotted with stars, and from all indications it was safe to predict that no rain would fall within forty-eight hours at the least. A strong gale was blowing toward the west. Five balloons were sent up and exploded and 200 pounds of rackarock powder and 150 pounds of

dynamite set off on the ground. There was, of course, no immediate result. The barometer was rising, and the needle was pointed at fair. By three o'clock in the morning a bank of clouds appeared on the western horizon at the point toward which the smoke and noise had blown. The sky rapidly became overcast, and by four o'clock there was rain, accompanied by thunder and lightning. When the sun rose, it was seen that the storm had come directly out of the west, and on the horizon the clouds rose in a funnel-shape, like the smoke from a volcano. There was a beautiful rainbow visible at sunrise. It ceased raining at about eight o'clock." The substance of the official report is to the effect that rain followed wherever there chanced to be moisture and the explosion was delivered at the proper altitude.

After the experiments were concluded there was a vast deal of discussion as to the scientific aspects of the case. Eminent scientific authorities were averse to acknowledging that any really beneficial results had been obtained or that any really valuable scientific conclusions had been reached. A great deal of fun was made in the newspapers about the whole proceeding, but the fact remains that the whole civilized world was intensely interested in the experiments, and those who had no individual hobbies to prove were disposed to view them with every possible allowance for imperfection of equipment and the lack of experience inseparable from a first attempt.

There are widely different theories as regards the possibility of inducing the conditions necessary to the precipitation of moisture which we popularly call rain. It is agreed in general that rain, under natural conditions, results from the mingling of air strata of different temperatures. The great level plains of the world, whether of earth or water, appear to be largely the birth-places of storms. Over such plains the air can most easily adjust itself in extended layers of different temperatures. The simplest condition preliminary to a rainfall is perhaps one in which a stratum of warm air underlies a similar stratum of cold air; between these two there may be a space of intermediate temperature separating the two hostile elements. It is admitted by students of meteorology that disturbances at or near the dividing line between these different strata may open a way for the cold air, which is heavier, to rush downward, and for the lighter warm air to rush upward. The mingling of the two under certain conditions, as yet not well understood, undoubtedly causes rain. So far science is agreed, but when we come to the details, opinions diverge. Thus, it is generally believed that at a considerable distance above the earth, or at least above the territory of the United States, there is a current of air almost perpetually moving eastward; that, therefore, if a local explosion could cause precipitation at a given place, the moisture would be carried perhaps one or two hundred miles before it could reach the earth. This, however, is mere speculation. The theory that rain can be precipitated by explosions certainly needs proof, but it needs proof no more than do the theories of those who scoff at the possibility of such a result.

The attention of observers from time immemorial has been drawn to the frequent occurrence of rains accompanying the heavy explo-

sions of volcanic eruptions or the comparatively trifling disturbances that occur on modern battle-fields. It appears to be established by authentic history that great battles are frequently accompanied or followed by rains, but a certain amount of untrustworthy statement comes in with these records. For instance, it is said that as many of the battles of antiquity, before the discovery of gunpowder, were followed by rains as is the case in more modern times. Mr. Dyrenforth himself is responsible for the suggestion that the meeting of armies provided, as were those of the Greeks and Romans, only with hand-weapons, might have caused sufficient atmospheric disturbances to produce rain. It requires certainly a great deal of confidence to place any faith in a theory of this kind. The mere clash of arms and the united shouts of thousands of enraged combatants could hardly be heard at the distance of a mile, even under very favorable conditions. The discharge of fire-arms disturbs the atmosphere to a far greater extent. It has fallen within the experience of almost every one to notice, for instance, the jarring of a window sash when a gun is discharged at a considerable distance. While it is easy, therefore, for the scientist to prove that a cubic foot of air can only be expanded by the highest explosive known to a comparatively moderate extent, he can not prove, for it is beyond his ken, what effect such expansion may have among the nice barometric and hygrometric adjustments possible in Nature's secret places. It is probably within the experience of most of us to have noticed the sudden fall of rain that often follows the shock of a thunder-clap, and we must accept the statements of travelers regarding the same results which are said to follow the tremendous discharge of volcanic eruptions. Violent and extensive rainfalls followed such eruptions as that of Krakatoa a few years ago in the Straits of Java. In South America, according to Humboldt and others, it is generally believed that volcanic eruptions, even in a very dry season, are apt to change the atmospheric conditions and produce rain. It is claimed, moreover, that the burning of woods, of the long, dry grassed prairies, and of cane-brakes in southern savannas, are so generally followed by heavy rain that there is considerable ground for believing that either the heat or the vast columns of smoke, or both together, have some share in producing the necessary conditions. Prof. Powers's book, referred to above, is the most elaborate attempt that has been made to collect in accessible shape all known statistics regarding the supposed effect of heavy artillery. Many of his conclusions have been questioned with more or less justice, but most of his facts are well authenticated. A few of these may be mentioned: During the siege of Valenciennes by the allied armies in 1793 the weather had been remarkably favorable for military operations, save that it had been peculiarly hot and dry. Two hundred pieces of heavy artillery were used in the attack, and half as many more in the defense of the city; and all these were often in action at the same time, and the weather became rainy very shortly after the cannonading began. At the battle of Dresden, in 1813, after an excessively hot August, the weather abruptly changed almost as soon as fir-

ing was opened. Prior to the battle of Waterloo, on June 17, 1815, the weather had been excessively hot, and a dense cloud hung over the waiting armies. The allied guns opened fire with a view to breaking the French advance; apparently the discharge destroyed the electrical equilibrium, for a thunder-clap burst forth and immediately a tremendous shower of rain fell, which, as one historian says, has probably never been exceeded even in the tropics for violence. This heavy rain, as is agreed by all the historians of that great battle, was largely influential on the operations of the main conflict which followed on June 18. Among Americans, too, there is a widespread belief that the discharge of fireworks on the Fourth of July is very certain to induce rain and interfere with the enjoyment of the national holiday.

It will occur to any one who considers the conditions indicated, that something more is required to produce rain than a mere explosion; apparently explosions have been delivered in the most favorable location and at the most auspicious moment, and yet no rain has followed. It is held with good show of reason that dust of some kind, either smoke or dust stirred up by a whirlwind, is almost a necessary concomitant in precipitating moisture. Whether this be so or not, experiments are recorded in which moisture is condensed in a glass receiver. It is found to be quite possible to form mist in perfectly dust-free air, but this was effected by forcing air into the jar and suddenly releasing the pressure, thereby causing an explosion or its equivalent by a sudden rush of atmospheric globules. It may be unsafe to say, with our present knowledge, that particles of different temperature may always be made to combine by concussion, yet it is very certain that sometimes they can be induced so to combine, and possibly by artificial means.

While, therefore, the experiments of last summer may not have been all that Science could wish, may not even have been conducted in all respects as she had a right to demand, it is hardly fair to pronounce them an utter failure.

That the impression made upon the public was on the whole favorable, appears from the formation of sundry rain-making companies, and the announcements of individuals to the effect that rain may be had for the asking, on payment of a suitable consideration. But for the readiness of people to be swindled, it were needless to caution the public against these organizations. Many years may elapse before the rain conditions are well enough understood to gratify trustworthy conclusions, but it is not outside the pale of probability that some time our country may be very proud that she was the first to institute experiments in this direction.

REFORMED CHURCHES. I. Reformed Church in America.—The Committee on the State of the Church reported to the General Synod, in June, 1891, that the number of churches was 570; of ministers, 582; of licentiates, 8; of communicant members, 94,323; of Sunday schools, 815, with 108,691 teachers and pupils; of admissions during the year on confession of faith, 6,114; amount of contributions to home missions, \$61,945; to foreign missions, \$116,265; to other benevolent objects, \$131,442; for congregational purposes, \$1,013,325.

The receipts of the Board of Home Missions had been \$61,945, of which \$12,112 had been obtained through the Woman's Executive Committee. Ninety-seven missionary porters had been employed in 137 churches and mission fields; 20 new churches had been organized, and 12 missions started; and 662 persons had been added on profession.

The Board of Education had 99 students under its care.

The contributions to the Disabled Ministers' Fund had increased nearly \$600 over those of the preceding year.

The total receipts for the year of the Committee on Foreign Missions had been \$116,265. The Woman's Board had contributed \$18,000, or \$200,000 since its organization. The Synod recommended the holding of general missionary conferences in behalf of the home and foreign boards.

The three classes in the theological seminary of the Arcot Mission, India, had been attended by 14 students.

The General Synod met at Asbury Park, N. J., June 4. The Rev. E. T. Corwin, D. D., of New Brunswick, N. J., was chosen moderator. The most important business transacted was the presentation and adoption of the report of the Committee on Federal Union with the Reformed Church in the United States. The report narrated the proceedings of the joint commission at the meeting held in the Catskill Mountain House in September, 1890 (see "Annual Cyclopædia" for 1890), and of a special meeting held in New Brunswick, N. J., June 3, 1891. The result of its work was given in the shape of a draft of constitution for a federal union, to be represented by a federal synod, and of special provisions for giving the constitution practical effect. A summary of the articles of the constitution is given below. The constitution and supplementary paper were adopted by a unanimous vote to be sent to the Classes for consideration and action by them. The Synod granted an application from the trustees of Rutgers College for a modification of the stipulation requiring that three fourths of the members of the board shall be communicants of the Reformed Church, so that only two thirds of them need be so qualified. Sympathy was expressed with the proposition of the Southern Presbyterian Church to petition the civilized nations to settle all disputes by arbitration. Agreeably to the report of the committee on a plan of securing recruits for the ministry, pastors were requested to present, at least once a year, the claims of the ministry on young men, and to direct the attention of parents and pious sons to this subject. The Committee on the State of the Church reported that the past year had been one of the most prosperous in the history of the denomination. The accessions had been more numerous than in any year since 1877. There had been a net increase of 12 churches, 787 communicants, 10 Sunday schools with 1,178 pupils, and an advance in benevolent contributions of \$3,399. The object and methods of the American Sabbath Union were approved, and it was commended to the confidence and support of the churches. A protest was declared against opening the World's Columbian Exhibition on Sun-

days. A Standing Committee on Sabbath Observance was constituted. The work of the New York Society for the Suppression of Vice was commended. The Committee on Systematic Beneficence was instructed to present some plan for adoption by the churches. In response to communications from the Presbyterian Church in the United States of America, committees were appointed to consider and confer upon the subjects of a consensus creed and a federation of Christian Churches.

II. Reformed Church in the United States.—The General Synod of the Reformed Church in the United States met in special session in Philadelphia, June 4. The Rev. J. S. Keifer, D. D., presided. The purposes of the meeting were stated to be to join with the Presbyterian Church in the United States of America in formulating a consensus creed, and to act on the question of union with the Reformed Church in America. The report on a federal union with the Reformed Church in America was taken up first. It said:

It is believed that if a union be formed, which gives but little authority or power to the judicatory at the beginning, the union will grow closer by trial, and the federal judicatory will gradually more and more win the confidence and affection of the Churches. If this federal judicatory should prove to be a decided advantage to the growth and prosperity of the Churches it represents, greater power may be given to it from time to time. Even if it should never possess more than advisory powers or functions, yet if it should serve to promote closer co-operation between the two Churches in the union, or, in addition, open the way for an alliance of all the Reformed Churches of this country, the experiment will not be in vain. Considering the repeated efforts to bring about this union, though former ones failed, it would seem that the desire for union is so deep-rooted that it will not be satisfied until a fair trial be made.

The articles agreed upon by the Joint Committee as the constitution of the federation and the provisions for carrying them into effect were unanimously approved; the president of the Synod was authorized, if the articles should be adopted by the Classes in 1892, in conjunction with the brethren of the Dutch Church, to designate the place of meeting of the Federal Synod, and delegates were chosen to represent the Church in that body. Concerning the other object of the special session (numbered 1 in the call), the Synod appointed a committee "to confer with the committee of the Presbyterian Church with regard to the forming of a consensus creed, and to co-operate with said committee, provided the consensus be based upon the historical confessions of the Reformed Churches holding the Presbyterian system, without giving preference to any one in particular." Exception had been taken in the debate to the omission in the overture of the Presbyterian General Assembly of the Heidelberg Catechism from the list of standards on which the consensus creed shall be based.

Constitution of the Federal Union of the Reformed Churches.—The following are the essential articles of this act:

I. Each denomination entering into this union shall retain its distinct individuality, as well as every power, jurisdiction, and right which is not by this constitution expressly delegated to the body hereby constituted.

II. Full faith and credit shall be given by each of the denominations to the acts, proceedings, and records of the duly constituted authorities of the other denomination.

III. For the management of certain common interests of these federated Churches, an ecclesiastical assembly is hereby constituted, which shall be known by the name and style of The Federal Synod of the Reformed Churches.

IV. The Federal Synod shall consist of sixteen ministers and sixteen elders from each of the constituent denominations, who shall be chosen with *secundi* under the direction of their respective General Synods in such manner as these Synods shall respectively determine.

[This article goes on to direct the method of allotting the terms of the members of the Federal Synod, so that one fourth of those representing either Church shall go out every year—the full term being four years.]

V. To the Federal Synod shall be committed powers relating to missions, domestic and foreign, to new educational enterprises common to both denominations, to the general superintendence of Sunday-school interests and literature, and to other ecclesiastical matters, such as shall be determined by the concurrent action of the constituent General Synods.

VI. The Federal Synod may advise and recommend in all matters pertaining to the general welfare of the kingdom of Christ, but shall not exercise authority except such as is expressly given it under this constitution. Whenever anything recommended by the Federal Synod shall have received the assent of each of the General Synods, it shall have the force of law in both denominations.

VII. The Federal Synod shall have power of opening and maintaining a friendly correspondence with the highest assemblies of other religious denominations, for the purpose of promoting union and concert of action in general or common interests.

VIII. The Federal Synod shall not interfere with the creed, cultus, or government of either denomination. Also, all matters of discipline shall be left to the exclusive and final judgment of the ecclesiastical authorities of the denomination in which the same may arise.

IX. All conflicting interests between the two denominations shall be arbitrated by such executive agencies as may be created by the Federal Synod, under this constitution, with the right of appeal to the Federal Synod for final adjudication.

Other articles relate to the officers of the Federal Synod, its meetings, provision for its contingent expenses, and amendments to the constitution, for which the concurrent action of the three bodies is required. Supplementary articles, styled recommendations of the joint commission, provide for the future management of home and foreign missions, Sunday school work and literature, and educational work under co-operative direction.

REFORMED EPISCOPAL CHURCH. The committee on the state of the Synod reported to the General Council of this Church in June that the number of parishes and missions was 111, and of communicants 9,967, the latter item showing a gain of 764 over the report of two years previously; amount of contributions for the last year only, \$192,197, being a gain of \$16,686 over the last report; value of church property, \$1,490,912; total value of property, \$1,943,912.

The thirteenth General Council of the Reformed Episcopal Church met in Cleveland,

Ohio, June 1. The treasurer's report showed that his total receipts had been \$15,944, and his expenditures \$13,397. For the fund for special Church extension \$20,141 had been received and \$20,086 expended. The receipts for the Theological Seminary had been \$16,601, and the expenditures \$18,508. Balances were reported in favor of the Sustentation fund of \$10,578; of the Widows' and Orphans' fund, of \$9,432; of the special Missionary fund, of \$4,000; of the Eleanor H. Stroud fund, of \$7,000; and of the estate of George Curtis, of \$28,085. The receipts for missions had been \$11,895. A mission had been begun in Alaska.

Reports of the condition of their several jurisdictions were made by Bishop Cheney, of Chicago; Bishop Nicholson, of New York and Philadelphia; Bishop Stevens, of the missionary jurisdiction of the South; Bishop Latané, of Baltimore; Bishop Fallows; and Bishop Cridge, of British Columbia. All except the last recorded healthy growth. The Council recorded its "distinct and emphatic opposition" to the appropriation by the civil authorities—national, State, and municipal—of money or properties to ecclesiastical organizations, and its fixed purpose not to ask or accept in future any such appropriation. A canon was agreed to declaring that "no presbyter coming from any evangelical church into this Church who has been previously set apart and formally ordained to the ministry of the Gospel shall be reordained by the authorities of this Church." The canon has, however, to be approved by another General Council before it can become a law of the Church. The election of the Rev. T. W. Campbell as Bishop of the First Synod of the Dominion of Canada was confirmed, and he was consecrated bishop in the presence of the Council. The Canadian Synod was authorized, at its discretion, to use informally the style "Protestant Church of England, which is the Reformed Episcopal Church of Canada." A delegate was appointed to represent the Church in the conference in favor of arbitration in place of war as a means of settling international disputes, which has been invited by the Southern Presbyterian General Assembly.

RHODE ISLAND, a New England State, one of the original thirteen, ratified the Constitution May 29, 1790; area, 1,250 square miles. The population, according to each decennial census, was 68,825 in 1790; 69,122 in 1800; 76,931 in 1810; 83,015 in 1820; 97,199 in 1830; 108,830 in 1840; 147,545 in 1850; 174,620 in 1860; 217,353 in 1870; 276,531 in 1880; and 345,506 in 1890. Capitals, Newport and Providence.

Government.—The following were the State officers during the year: Governor, John W. Davis, Democrat, succeeded by Herbert W. Ladd, Republican; Lieutenant-Governor, William T. C. Wardwell, succeeded by Henry A. Stearns; Secretary of State, Edwin D. McGuinness, succeeded by George H. Utter; General Treasurer, John G. Perry, succeeded by Samuel Clark; State Auditor and Insurance Commissioner, Elisha W. Bucklin, succeeded by Albert C. Landers; Attorney-General, Ziba O. Slocum, succeeded by Robert Burbank; Railroad Commissioner, E. L. Freeman; Commissioner of Public Schools, Thomas B. Stockwell; Chief Justice of the Su-

preme Court, Thomas Durfee, who resigned in March and was succeeded by Justice Charles Matteson, by election of the General Assembly; Associate Justices, Pardon E. Tillinghast, John H. Stiness, George A. Wilbur, Charles Matteson, promoted as above stated, Horatio Rogers, and William W. Douglas. The two last named were elected by the General Assembly on May 27, one to succeed Justice Matteson and the other as the additional justice authorized by an act of the General Assembly passed on the same day.

Finances.—The following is a summary of State finances for 1891: Funded debt, Jan. 1, 1892, \$1,283,000; sinking fund, Jan. 1, 1892, at par, \$1,049,763.68; State debt, less sinking fund, \$233,236.32. State debt, less sinking fund, Jan. 1, 1891, \$331,296.05; decrease past year, \$98,059.73; balance in treasury, Jan. 1, 1891, \$85,528.57; receipts, 1891, \$1,202,263.13; total, \$1,287,791.70. Payments, 1891, \$1,211,852.23. Balance in treasury, Jan. 1, 1892, \$75,939.47. The total receipts for the year were greater by \$126,299.48 than the receipts for 1890, the increase being mainly due to the refunding to the State of \$87,493.34 direct tax paid to the United States during the civil war. A large increase of expenditure was caused by the erection of new buildings at the State Agricultural School, the Soldiers' Home, and the State institutions at Cranston. The State tax is still assessed on the valuation of \$328,530,559, made when the population was about 235,000. Since that time the population has increased to upward of 350,000, while the present valuation, according to the Board of State Valuation, is \$396,794,552. Were the State tax assessed on this latter valuation the increase in receipts from that source would be \$126,000. The State is practically out of debt, the funded debt being provided for. To secure increased revenues the need of a new system of taxation is imperative.

Legislative Session.—The adjourned session of the General Assembly of 1890 began on Jan. 20 of this year and ended on May 1. An act was passed at this session in the interest of employes, providing that "every corporation, other than religious, literary, or charitable corporations, and every incorporated city, but not including towns, shall pay weekly the employes engaged in its business the wages earned by them to within nine days of the date of such payment, unless prevented by inevitable casualty." A fine is imposed for violation of these provisions.

The Australian ballot system, which was first introduced in State elections, and later, by an act passed in June, 1890, extended to municipal elections, was at this session further extended by a general law so as to apply to elections for town officers in any town that by a majority vote shall decide to accept the provisions of the act. Towns that accept the Australian system are required to bear the expense of providing the official ballots. Two special acts were also passed requiring the towns of Cumberland and East Providence to use the Australian system. An institution for the care and education of deaf children, known as the Rhode Island Institute for the Deaf, was established, and \$50,000 appropriated for land and buildings. Other acts of the session were as follow:

Regulating the sale of coal by measure in baskets, fixing the size of baskets for bushel and half-bushel measures, and requiring all such to be scaled.

Authorizing the city of Providence to borrow the following sums: \$700,000 to be expended for highway work; \$2,000,000 to be expended on sewers, in addition to sums previously authorized for the same object; \$500,000 for the purchase of land for parks and the construction thereof; \$300,000 for the purchase of lots for school-houses and the building of school-houses; and \$400,000 for improving the water supply, in addition to sums previously authorized for the same purpose.

Granting to the city of Providence the right to condemn the Hopkins Burial Ground for park purposes.

Authorizing the city of Woonsocket to borrow \$400,000 for establishing and constructing a system of sewerage, and \$200,000 for enlarging and improving its water-works.

On April 17, in grand committee, Charles Matteson was elected Chief Justice of the Supreme Court, vice Thomas Durfee resigned.

The General Assembly chosen at the April election assembled at Newport on May 26, and adjourned on May 29, to meet at Providence on July 21. On the first day of the session the returns for State officers were opened, and no election by the people was declared. The Assembly then elected Herbert W. Ladd to be Governor; Henry A. Stearns, Lieutenant-Governor; George H. Utter, Secretary of State; Samuel Clark, General Treasurer; and Robert Burbank, Attorney-General. On May 27 Albert C. Landers was elected State Auditor. An act was passed on the same day increasing the number of Associate Justices of the Supreme Court from four to five, and Horatio Rogers and William W. Douglas were elected to that office, one of them being a successor to Justice Matteson, who had been promoted to Chief Justice. The control of the State Home and School was taken from the State Board of Education and vested in a board of seven persons, to be appointed by the Governor with the approval of the Senate, each holding office for three years. For the purpose of securing a State exhibit at the World's Columbian Exposition, \$10,000 was appropriated, to be expended under the direction of a board of World's Fair managers. At the adjourned session this was increased to \$25,000. The session adjourned on Aug. 5, to meet on the third Tuesday of January, 1892, at Providence.

Education.—For the school year ending April 30, 1890, the Commissioner of Public Schools reports the following statistics: Pupils enrolled, 52,774; average attendance, 33,905; average school year, nine months eight days; male teachers, 174; female teachers, 1,204; average monthly wages—male teachers, \$89.48; female teachers, \$45.40; paid for teachers' wages, \$549,367.38; total receipts for school purposes during the year, \$1,091,993.86; total expenditures for school purposes, \$917,990.26; number of school-houses, 482; value of school property, \$2,739,672. There were 45 evening schools conducted during the year for an average of 12½ weeks, in which 7,623 pupils were enrolled, the average attendance being 2,858. There were 125 male and 207 female teachers employed in these schools. The annual census of children of school age (between five and fifteen years of age) taken in January, 1890, showed 43,163 attending

public schools: 8,275 attending Catholic schools; 1,478 attending select schools; and 12,044 not attending school. The attendance at the State Normal School for the year ending June 26 was 203, an increase of 3 over the previous year. On Dec. 31 there were 55 pupils at the Agricultural School at Kingston.

Charities.—At the State Insane Asylum there were 515 inmates on Jan. 1, of whom 238 were men and 277 women. During the year, 178 patients were admitted and 152 discharged, leaving 541 remaining on Dec. 31, of whom 252 were men and 289 women. The State almshouse contained 236 inmates on Jan. 1; 310 were admitted during the year, and 311 were discharged.

At the Sockanosset School for Boys the whole number in school Dec. 31, 1890, was 185; received during the year, 151; number discharged, 161; total number in school Dec. 31, 1891, 175; at the Oaklawn School for Girls there were 30 girls on Jan. 1. During the year there were received 36 pupils, and 30 were discharged. The year has seen the completion and occupation of the new almshouse, construction of a chapel and hospital, and introduction of industrial training at Sockanosset School for Boys.

Prisons.—At the State Prison there were 110 men and 2 women on Dec. 31, 1891, of whom 100 were white and 12 colored. The average number for the year was 112. The State Work-House and House of Correction contained 215 men and 51 women on Jan. 1, 1891. There were committed during the year 441 men and 135 women; 452 men and 131 women were discharged, and there remained on Dec. 31 204 men and 55 women. At the Providence County Jail there were committed during the year 1,995 men and 259 women; there were discharged 1,997 men and 263 women; and there were remaining 240 men and 15 women on Dec. 31.

Soldiers' Home.—The dedication of the Soldiers' Home at Bristol was observed May 21, since which time the number of veteran soldiers at the institution has steadily increased. The whole number of inmates on Dec. 31 was 92.

Militia.—The military and naval force of Rhode Island numbers 1,492 officers and men, of whom 1,036 are in the brigade. Twenty-four thousand dollars has been nominally the annual appropriation, but the Assembly has been called upon at the close of each year to make up a deficiency of upward of \$5,000. An important addition to the available force has been made the past year in a company of naval militia organized in Bristol, numbering 57 officers and men.

Savings Banks.—In the savings banks and institutions for savings the deposits on Nov. 17, 1891, were \$66,276,157.44, a gain for the year of \$2,556,665.87. The number of depositors was 136,648, an increase of 4,996.

Political.—On March 10 a State Convention of the Republican party met at Providence and nominated the following ticket, to be voted for at the State election in April: For Governor, ex-Governor Herbert W. Ladd; for Lieutenant-Governor, Lyman B. Goff; for Secretary of State, George H. Utter; for Treasurer, Samuel Clark; for Attorney-General, Robert W. Burbank. A resolution in favor of the policy of reciprocity inaugurated by Hon. James G. Blaine was passed, but no distinct party platform was adopted.

Lyman B. Goff, the candidate for Lieutenant-Governor, was later mentioned on the ticket by Henry A. Stearns.

On the same day the Prohibition State Convention met at Providence and made the following nominations: For Governor, Rev. John H. Larry; for Lieutenant-Governor, Joshua C. Brown; for Secretary of State, David O. Cargill; for Treasurer, Louis E. Romington; for Attorney-General, Thomas H. Peabody. The platform contains, in addition to the usual anti-saloon resolutions, the following:

We declare that our present tariff is improperly called "protection to American labor," and while we believe that it is impossible to make this a great national issue, such modifications should be made as will cheapen necessities rather than luxuries, and stimulate private enterprise instead of fostering trusts and monopolies.

We call especially for the enforcement of laws in regard to the employment of child-labor in this State.

The Democratic State Convention met at Providence on March 12, and re-nominated Gov. Davis, Lieut.-Gov. Wardwell, Secretary of State McGuinness, Treasurer Perry, and Attorney-General Slocum. The following is a portion of the platform:

It [the Democratic party] demands free raw material for the manufacturing industries of this State, and lower taxes on the necessities of life for our people generally; and it denounces the policy by means of which the Eastern States are reduced to the position of the fiscal feudatories of Pennsylvania and Ohio.

The Democracy of Rhode Island does not advocate the impossible theory of free trade, but it believes in a freer trade with all countries, exchange and barter being the life of business.

We are in favor of honest money, sufficient in quantity to answer the needs of the people.

We are in favor of elections by a plurality instead of majority vote, a more uniform franchise than now exists, freedom of judges from legislative control, except in the ordinary case of impeachment, and additions to executive power and responsibility. For these and other needed reforms, a constitutional convention is necessary, and we favor it for these reasons.

There was also a ticket in the field representing the Nationalist party. At the April election there was no choice by the people, no candidate having a majority of all the votes cast. For Governor, Davis received 22,249 votes, Ladd 20,995, Larry 1,829, Burton, the Nationalist candidate, 384. The choice thereupon devolved upon the General Assembly, which in May elected the Republican candidates. Members of the General Assembly of 1891-'92 were voted for at the same election, but several by-elections were necessary before the full membership was determined. The result was in favor of the Republicans, who elected 27 members of the Senate and 52 of the House. The Democrats elected 9 Senators and 20 members of the House.

ROMAN CATHOLIC CHURCH. The most striking characteristic of 1891 was the special interest taken by the Church authorities, from the Pope down, in the social question. Leo XIII, by his great encyclical and his letters foreshadowing it, struck the keynote, and the Catholic congresses of France, Germany, Spain, Belgium, and England, tuned their deliberations and their pronunciamientos in harmony. The discussions of all these assemblies intimated the

determination of the Church to counteract the march of Socialism and anarchy by leading in the effort to uplift the masses who through degrading and exhaustive toil have neither the means, the opportunity, nor the inclination to assist themselves.

Besides this, the year was marked by an intensified zeal in missionary work. Cardinal Lavigerie's crusaders were materially augmented in Africa; the Jesuits were specially active in the remote northern countries; the members of the Lyons Propaganda Society penetrated every corner of Madagascar, Japan, Borneo, New Guinea, China, and India. The Franciscans were given charge of the holy places in the East, and a fresh effort was inaugurated to bring the schismatic churches of the Orient into communication with Rome.

The relations of the governments of Germany, Austria, France, England, and even Russia with the Vatican showed improvement on the whole. The Italian Government continued to regard Rome and the treasures of the Church as its private property, and Marquis Rudini, Premier Crispi's successor, served notice on the Pope that while he proposed to maintain the "law of guarantees," he would brook no interference of the Vatican with the absolute authority of King Humbert in matters either of Church or state. The municipal elections in Rome, which are the only ones in which Catholics are allowed to participate by the Pope, showed a respectable Catholic return in the city council.

The Vatican.—The first official document signed by His Holiness at the opening of the year was one blessing the project of Archbishop Salvatore to honor Columbus in his native Genoa. It emphasizes the Christian character of the discoverer. The letter is as follows:

To our Venerable Brother Salvatore, Archbishop of Genoa: Health and Apostolic benediction:

It is pleasing to us to learn from your letter of the 4th of January that you are laboring with diligent zeal to prepare for the coming year at Genoa solemn secular festivities in celebration of the memorable voyage of which Christopher Columbus succeeded, four centuries ago, in discovering previously unknown regions on the other side of the globe.

Assuredly it is above all fitting that the honor which many are eager to render to this immortal genius in other places, should be paid to him in the city in which he was born, and to which he is a distinguished ornament and honor. We therefore highly approve of your design of establishing a council of chosen citizens to see to the carrying out of this intention, and we have read with great satisfaction the pastoral letter which you have, with that view, addressed to the clergy and laity of the diocese over which you preside. But your prudence and piety are principally manifested in your earnest anxiety that the celebration and rejoicings should be of a character in keeping with Columbus's undertaking, his disposition, and the spirit by which he was animated. For it is attested by the most undoubted historical monuments that he entered his arduous undertaking in order that the light of the Gospel might be shown on those distant shores, and he became in some measure a minister of Christ, who said to his disciples, "Go throughout the world and preach the Gospel to every creature." Hence injury would be done to the memory and the name of this excellent man by any one who would only recognize the worldly aspect of his undertaking, and who would tender to Columbus merely the honors to be awarded to those who take no thought of the Catholic faith, and in their great

deeds seek to gain alone praise for ability and constancy.

The religious feeling and wisdom by which the people of your Liguria and the other Italians are distinguished being well known to us, we doubt not that it will be understood by many that you have provided in the best way for honoring the memory of such a remarkable man, and that they will spontaneously and heartily support and aid the council of worthy citizens established by you.

We sincerely trust that through this celebration, and through the effect of the example set by Columbus, the zeal of many will be stimulated, so that each shall do all that is in his power to extend the kingdom of Christ on earth.

Meanwhile, for the aforesaid design we implore the divine assistance, and to this end we affectionately impart the apostolic benediction to you, venerable brother, and to the clergy and people confided to your care.

Given at St. Peter's, Rome, on the 10th January, 1891, and the thirteenth year of our pontificate.

LEO XIII, Pope.

The Temporal Power.—On the 3d of March the Pope addressed a long letter to the hierarchy of Austria, in which he advised annual reunions among the bishops, annual congresses of laymen to discuss social, scientific, and moral principles, the encouragement of the Catholic press, active effort to solve the labor problem amicably, and the higher education of the clergy. He specially referred to the necessity for the temporal power in these words:

In the unfortunate times with which we are afflicted, we desire that all efforts and care should from the start tend to reunite, by approaches growing nearer every day, the lines of the Christian family with the hierarchical order; in such fashion that the faithful may be united to their bishops in all good will and submission, and, above all, that they guard with ardor and bravely profess one faith, one obedience, and one filial piety under the Bishop of the Universal Church.

Now, since to wish that the Roman Pontiff may be subject to no human power, and that he may be fully and perfectly free, is a sacred obligation which concerns the Catholics of all nations, and not one alone, the bishops should consult upon the matter and apply themselves to arouse and excite the solicitude of the faithful in this very just cause, with the view of hastening a happy result.

The Pope and Slavery.—Pope Leo on his eighty-first birthday, March 2, in answer to the congratulations of his cardinals, spoke at length upon the trials of his pontificate, which he likened to that of Gregory the Great. He drew special attention to the African slave trade, and said that if the Lord spared him to celebrate his episcopal jubilee in 1893, he would devote the offerings of the Christian world to him on that occasion to the abolition of slavery and Christianization of Africa.

St. Peter's shaken.—The Vatican was shaken by an explosion of 260 tons of gunpowder in a magazine on the outskirts of Rome, April 24. All the windows of the Pope's library were shattered, and many precious relics were destroyed. St. Paul's Church and monastery suffered specially. The tercentenary celebration of the death of St. Aloysius Gonzaga, June 21, was worldwide, and a special feature of it was a pilgrimage to Rome by the young Catholics of Italy.

The Labor Encyclical.—Pope Leo, under date of May 15, issued what will probably pass

down to history as the most remarkable encyclical of his pontificate. It recorded his sympathy with the legitimate aspirations of the toilers in the language of conciliation and love. The reciprocal duties of labor and capital, as well as the provinces of the Church and state in ameliorating the conditions of the impoverished, ill-paid, and neglected workers, were distinctly pointed out. It indicated the necessity for mutual forbearance and consideration on the part of employers and employed, defended the right of labor to combine for remunerative wages and protection from injustice, as well as that of the state to interfere in behalf of shorter hours, sanitary conditions, and by enactment prevent female and child labor in exhausting employments. It urged that the standard of return for labor be not that of mere subsistence, but such as shall facilitate the acquirement of property, allow for provision for age and accident, and give opportunity for moral and intellectual improvement, physical development and rational enjoyment.

The College of Cardinals.—Six cardinals (including Mgr. Rotelli, who died before he received the insignia) passed away during 1891.

Cardinal James Simor, who died Jan. 23, was Archbishop of Gran and Primate of Hungary. He was born at Stuhlweissenburg, Aug. 25, 1813, and commenced life as a shoemaker. At his death he was one of the wealthiest as well as most powerful philanthropists of Austria. A large portion of his revenues was personally distributed by him among the poor, in sustaining the poorer clergy, and in maintaining hospitals, convents, and schools. His influence in state matters was vast.

Cardinal Charles Christofori, who died Jan. 30, had just turned sixty-eight, and was prefect of the Sacred Congregation of Indulgences and Relics. He was one of Pope Leo's selections.

Cardinal Joseph Mihalovitch, who died Feb. 19, at seventy-seven, was made a member of the Sacred College by Pius IX in 1877. He was noted for his charities, his last act being to donate 100,000 rubles to eleemosynary institutions.

Cardinal Cajeta Alimonda, Archbishop of Turin, who died May 24 was noted as "the Lacordaire of Italy." He was born in Genoa in 1818, and was a journalist. He edited the "Cattolico" in Rome, and signalized his administration of that organ by defending Dr. Newman in 1852. His lectures in Genoa in 1864 are by some high authorities declared to be "the finest specimens of oratorical art of the century."

Cardinal Louis Haynold, Archbishop of Kalocsa and Bács, Hungary, who died July 5, was renowned for his learning, statesmanship, and patronage of the arts and sciences. His works are numerous and standard. He was made cardinal in 1879 with Archbishop Alimonda.

Cardinal Rotelli, who died suddenly, Sept. 15, at fifty-eight, was Papal Nuncio at Paris. He was a born diplomat, and to him belongs the credit of reuniting the Armenian Catholics with the Church.

In France.—The laicization of the schools was completed, but the laws relative to the service of clerical students in the army were relaxed. The appearance of "The Catholic

Republican" marked the growing desire to harmonize the Church with the republic on the lines of Cardinal Lavigerie and the Pope.

In Germany.—The elections gave the Catholics under Herr Windthorst 100 representatives, who, uniting with the Conservatives, controlled the legislation of the empire. One of the first results was the return of 16,000,000 marks as interest on the property and appropriations of the Church confiscated during the Bismarckian *Kulturkampf*. Acknowledging this act of justice, Leo XIII wrote Emperor William, and, among other things, said the religious sentiment alone could solve the terrible social problems of the present hour.

The death of Windthorst was a severe blow to the German Catholic cause. It occurred March 14. He was eighty years old, and had led the Center party against Bismarck from 1871. His last words urged his compatriots to wage an uncompromising battle until every principle dear to them was vindicated. He was working for the return of the expelled religious orders and the religious educational question at the time of his death.

The Holy Coat of Treves, presented as a relic of Jesus Christ to the city of Treves by St. Helena, mother of Charlemagne, was exposed to public view at the cathedral, beginning Aug. 23. One million two hundred thousand pilgrims saw it during the period of its exhibition.

In England.—The first week in February witnessed a great debate in the House of Commons on the reading of the "Religious Disabilities Removal Bill," being an effort to abolish the remaining penal laws which prevent Catholics from holding certain high political offices. Mr. Gladstone advocated the bill in one of the finest speeches of his life, but it was beaten on the second reading by a vote of 256 to 223.

The year saw the beginning by the Society of Jesus in England of a great commentary in English on the Scriptures. Twelve Jesuit fathers were designated for the work, which is to cover six years. The first volumes will be published in 1893.

The return of the English Benedictines from Douai, France, after an exile of three centuries, was celebrated early in the year. The order re-established itself at Great Malvern.

In Ireland.—The *liaison* of Charles Stewart Parnell with the wife of Captain O'Shea caused the withdrawal of the support of the Irish hierarchy from the Home-rule leader early in the year. In a public manifesto signed by all the bishops it was declared that Parnell had by his immorality outraged the sentiments of a religious people. As shepherds of the Catholic flock they could not condone the offense by silence. An anti-clerical agitation was immediately started by Parnell and his followers. The verdicts at the polls sustained the stand of the bishops.

Persecutions in China.—In May an anti-foreign uprising took place in Wahu, and the Catholic missions were looted and burned. The priests escaped to boats in the river. The outbreak, conducted by organized secret societies of a Nihilistic nature, spread, and European missions of every denomination were attacked. The native converts suffered terribly, and the

governments of England and France called the attention of the Pekin authorities to the atrocities, intimating that, if the Emperor's forces were unable to cope with the offenders, they would assume the offensive.

In Japan.—The vicarates apostolic into which Japan was divided in 1890 were fully organized into sees in 1891.

In Africa.—Every Catholic congregation in the world contributed toward a special fund for the Christianization of Africa on the feast of the Epiphany (Jan. 6), as ordered by Leo XIII, in his encyclical of Nov. 30, 1890. Seven hundred priests attend to the spiritual wants of nearly 400,000 Catholics in the territory now being opened up to commerce and civilization. Cardinal Lavignerie, who has direction of the mission work, sent many additional "Crusaders" to the assistance of those already in the field.

Spain.—At the beginning of February the restoration of the Convent of Santa Maria la Rabida, three miles from Palos, in which Christopher Columbus and his son Diego found shelter and the friendship of Padre Juan Perez, after the futile mission to the court of King John of Portugal, was commenced by the Spanish Government. It was announced that when restored the edifice would be returned to the Franciscan fathers, from whom it had been despoiled.

The Church in the United States.—Several new bishoprics were created, and a new see was erected in this country in 1891. Rt. Rev. Bishop Katz was elevated to the archbishopric of Milwaukee, and Rt. Rev. Richard Scanlan, D.D., Bishop of Concordia, was transferred to the diocese of Omaha, vacant by the death of Bishop O'Connor. Rt. Rev. Bishop Hennessy, of Wichita, became Administrator of Concordia. The vicarate of Utah is erected into a diocese with the Rt. Rev. Laurence Scanlan, D.D., heretofore vicar apostolic, as its first bishop; Rev. Thomas Brennan, of Driftwood, in the diocese of Erie, Pa., has been chosen Bishop of Dallas, Texas. The prefecture apostolic of the Indian Territory has been raised to a vicarate apostolic, and Rt. Rev. Theophile Meerschaeft, of Natchez, made vicar apostolic. Rev. Dr. John Brady, of Amesbury, Mass., has been consecrated Bishop of Alabama *in partibus*, and coadjutor to Archbishop Williams, of Boston; and Rev. Dr. P. S. Chapelle, pastor of St. Matthew's Church, Washington, D. C., has been raised to the episcopacy and made auxiliary Bishop of Santa Fé.

Catholics and the Census.—The United States census gave the number of Catholic communicants at 6,250,045 in 10,231 congregations. In this enumeration children who have not received their first communion are not included, so that the estimate of the entire Catholic population may be set down as all the way from 10,000,000 to 12,000,000. Bishop Hogan, of Kansas City, insists that the correct figure is 14,000,000. The seating capacity of the edifices used for church purposes is 3,435,793; and the Sunday services vary from one to nine in each place. The total value of the property held by the Church is \$118,381,516. New York has \$9,000,000 of this; Chicago, \$6,457,064; Boston, \$6,379,078; Brooklyn, \$5,751,907; Newark, \$4,297,492. The 22 dioceses which are credited with upward of 100,

000 communicants, respectively, are: Baltimore, 190,577; Boston, 407,536; Chicago, 324,632; Cincinnati, 129,780; Milwaukee, 111,016; New Orleans, 181,964; New York, 452,626; Oregon, 26,164; Philadelphia, 251,162; St. Louis, 121,621; St. Paul, 193,039; San Francisco, 112,180; Santa Fé, 81,315; total, 2,583,612. The total seating capacity of their churches is 1,143,336.

The Cahensly Agitation.—A remarkable petition, signed by Herr Cahensly and a number of European Catholics, was addressed to the Vatican authorities in June. It called attention to certain alleged derelictions as to Catholic emigrants on the part of the American hierarchy, and particularly pointed out the necessity for national bishops and priests in the United States. The presentation of this memorial caused an outburst of indignation in America at what was considered a desire of foreigners to perpetuate national distinctions and transfer national antagonisms, prejudices, and customs to the New World to the disadvantage of the Church. The American bishops took it as a reflection upon themselves, and Cardinal Gibbons, as their mouth-piece, indignantly denounced the memorial as an unwise interference with the natural order of things, and an entirely uncalled-for emanation of an officious self-constituted European clique whose utterances only gave enemies another opportunity of pointing out the Catholic Church most unjustly as a foreign growth in the republic. The agitation waxed wrathily for some time among the abettors of Cahensly, but it was finally settled by the Holy See rejecting the recommendations of the petitioners.

Mission Work among the Indians.—The discussion over the Indian Appropriation bill in Congress revealed the fact that the sum granted for the support of Indian children in Catholic mission schools was \$162,500 in excess of the total given to all the other denominational schools. The Government appropriation for denominational schools in 1891 amounted to \$579,218, and the Catholic allowance was \$366,348. The rolls of the Catholic Indian schools showed 340 more pupils in attendance for 1891 over the year 1890, the total being 3,353, or nearly three fourths of the whole number of the children attending Indian denominational schools. In the discussion a disposition hostile to the appropriations was developed on the ground that the Government could not give support to sectarian institutions. This brought forward splendid testimonials from members who had visited the reservations—notably Senator Vest, who, in a remarkable speech, declared that the Catholic Church, through the energies, devotion, and sacrifices of her missionaries in behalf of civilization, had proved her title as "the truest friend of the Indian."

Miss Drexel's New Order.—In February Archbishop Ryan received the vows of Miss Kate Drexel in St. Mary's Convent, Pittsburg, and gave the authorization and blessings to the new order founded by her. Miss Drexel took the name of Sister Catherine in religion, and chose the title of Sisters of the Most Holy Sacrament for her order. The object is the evangelization of the negroes and Indians in the United States, and she devotes her interest in the great Drexel estate, estimated at \$8,000,000,

for this work. She has since finished a mother house for the order at Andalusia, Pa., and received quite a number of recruits.

Another new order was introduced by Bishop Hennessy, of Dubuque—the Sisters of the Holy Cross—devoted to teaching in the parochial schools.

Cardinal Manning's Message.—Cardinal Gibbons, on May 18, received the following message by phonograph from Cardinal Manning:

Your Eminence: The Catholic Church in England sends its greetings to you, and to the Catholic Church in America and to all the citizens of the United States, and hopes that we may always be of one heart and one mind, and become one fold of one Shepherd.

HENRY EDWARD,
Cardinal Archbishop.

The School Question.—The great test case of *The State of Ohio vs. The Rev. Dr. P. F. Quigley*, for resisting the compulsory education law, was decided on May 7, in the lower court at Toledo, against the defendant, and a fine of \$25 imposed. Ex-Judge Edmund F. Dunne, for Dr. Quigley, made an earnest plea in defense of the natural right of the parents to educate their children, and the case was taken on appeal to the Circuit Court, which sustained the judgment. It now goes to the Supreme Court, the grounds being that the Ohio Constitution recognizes the natural law in the matter and forbids the compulsory law.

The School Question in Canada.—The Dominion Supreme Court refused to sustain the Winnipeg law abolishing the Catholic separate schools. Under this decision the Catholics again receive the *pro rata* share of taxation for educational purposes.

Felicitous Commemorations.—Rt. Rev. John J. Williams, the first Archbishop of Boston, celebrated the twenty-fifth anniversary of his consecration as bishop on the 11th and 12th of March. There were appropriate ceremonies participated in by the clergy and laity from all parts of New England.

The Catholics of West Virginia celebrated the twenty-fifth anniversary of the ordination of Rt. Rev. John J. Kain, Bishop of Wheeling, July 2.

Rt. Rev. Bishop Vertin, of Marquette, had an equally brilliant jubilee celebration, Aug. 31.

Bishop Hennessy's jubilee in Dubuque, Sept. 13, was the most remarkable event in the history of religious commemorations in Iowa.

The great celebration of the year, however, was that by the aged Archbishop Kenrick, of St. Louis, of the fiftieth anniversary of his consecration as bishop, Nov. 30 and Dec. 1. The Cardinal, a special envoy from Rome, and the hierarchy with few exceptions, participated in the jubilee. The archbishop is the oldest officiating bishop in the world.

Four Great Monuments.—A monument to Father Junipero Serra, founder of the California Franciscan missions, was erected June 3, at Monterey, overlooking the spot upon which he landed in 1770. It is a gift to the city from Mrs. Leland Stanford.

St. John's College, Fordham, N. Y., celebrated its golden jubilee on June 24 by the unveiling of a bronze statue of its founder, Most Rev.

John Hughes, Archbishop of New York. Archbishop Ryan, of Philadelphia, was the orator.

The State of Maryland erected a monument on June 3, at Old St. Mary's, the capital of Catholic Maryland, to Leonard Calvert, the first governor of the colony, and the man to first proclaim religious liberty in the New World.

A marble statue of Pope Leo was unveiled at the Catholic University, Sept. 28.

Other Notable Events.—The new St. Mary's Cathedral, San Francisco, the largest and finest church edifice on the Pacific coast, erected under Archbishop Riordan, at a cost of \$300,000, was dedicated on Jan. 11.

The Dominican Convent, O'Neill City, Neb., was burned in February. St. Mary's Hospital, Rochester, N. Y., was destroyed the same month, but through the heroic actions of the Sisters of Charity all the invalids were rescued.

On March 19, George Parsons Lathrop, the author, and his wife (daughter of Nathaniel Hawthorne) were received into the Church by Rev. Alfred Young, of the Paulist order. Being asked publicly for his reasons, Mr. Lathrop gave them in a letter to the "Independent."

In April the Catholic University at Washington was enriched by the gift of \$400,000 worth of New York city real estate. Rev. James McMahon was the donor, and the endowment was to establish a school of philosophy.

A great mass meeting to further American Catholic history, held in the Academy of Music, Philadelphia, March 31, was presided over by Rev. Dr. Horstmann, and addressed by Cardinal Gibbons, Archbishop Ryan, and Hon. John Lee Carroll. It was practically decided to establish Catholic historical societies all over the country, with a great central library of reference in Philadelphia.

On May 9 the Catholic editors of the United States met in New York and formed a national association.

On May 17 the corner-stone of a new theological seminary for the archdiocese of New York was laid by the Most Rev. M. A. Corrigan near Yonkers, in the presence of a large multitude. The building will cost \$600,000, and its library will be one of the finest in America.

Cardinal Gibbons conferred the pallium upon Archbishop Katzer, of Milwaukee, Aug. 20.

The Father Drumgoole Memorial Church, Mount Loretto, Staten Island, erected in honor of the newsboys' benefactor, was begun on Sept. 13, in the presence of 20,000 persons.

St. Mary's Seminary, Baltimore, celebrated its centenary Oct. 28.

ROUMANIA, a monarchy in eastern Europe. The reigning King is Carol I, born April 20, 1839, son of Prince Carl of Hohenzollern-Sigmaringen. He was elected Domnul or Prince on May 22, 1866, and was proclaimed King on March 26, 1881. His marriage with Princess Elisabeth of Newburg being childless, Prince Ferdinand, born Aug. 24, 1865, the younger son of Prince Leopold, elder brother of the King, was selected as heir and accepted by the Assembly. The legislative body consists of a Senate of 120 members, elected for eight years, and a Chamber of 183 Deputies, elected by the people, divided into three classes of voters, for four years.

Area and Population.—The area of Roumania is 48,307 square miles. The population reported in the census of 1885 was 4,650,823, but the result is officially declared to be below the actual number, which is estimated at 5,000,000. Of this number about 4,250,000 are Roumanians and the rest are Jews, gypsies, Bulgarians, Germans, Magyars, Armenians, etc. The people of Roumanian race in Hungary, Servia, Bulgaria, and European Turkey exceed in number those within the boundaries of the kingdom. The number of marriages in 1890 was 38,654; the number of births, 204,669; the number of deaths, 150,757; excess of births, 53,912. Bucharest, the capital, has 221,000 inhabitants; Jassy, 90,000; Galatz, 80,000.

Finances.—The receipts of the Government for the year ending March 31, 1890, were 159,849,207 lei or francs, and the expenses 158,770,924 lei. Of the total receipts 29,335,000 lei were derived from direct taxation, 41,205,000 lei from indirect taxes, 42,950,000 lei from state monopolies, 23,619,600 lei from domains, 13,527,000 lei from public works, 3,816,000 lei from the various administrative departments, and 8,225,000 lei from other sources. Of the total expenditures 61,441,318 lei were required for the public debt, 63,560 lei the expenses of the Council of Ministers, 4,171,068 lei were allocated to the Ministry of Domains, 6,176,548 lei to the Ministry of Public Works, 12,226,571 lei to the Ministry of the Interior, 22,335,435 lei to the Ministry of Finance, 38,355,598 lei to the Ministry of War, 1,508,766 lei to the Ministry of Foreign Affairs, 17,537,886 lei to the Ministry of Public Instruction, 5,229,544 lei to the Ministry of Justice, and 692,406 lei to the fund for supplementary and extraordinary credits.

The public debt on April 1, 1892, amounts to 969,575,228 lei, requiring for the payment of interest, mostly at 4 and 5 per cent., the sum of 56,985,923 lei in 1891-92.

The Army.—The four army corps are territorially distributed in nine divisions, each composed of two brigades of two regiments. The Dorobantzi, or infantry soldiers, are armed with Martini rifles. The peace effective of the army is 2,936 officers and 48,500 men, with 13,200 horses and 600 cannon. This does not include 71,000 men in the territorial army. In time of war each division can be brought up to a strength of 32,000 men, and the Dobrudja division can be brought up to 20,000 men, making a total effective of 3,500 officers and 148,000 men, with 15,000 horses.

The naval force in 1891 consisted of 1 torpedo cruiser, 2 side-wheel avisos, 5 screw gunboats, 1 torpedo gunboat, and 5 torpedo boats.

The frontier fortifications, erected on the designs of the Belgian Gen. Brialmont, make it very difficult, if not impossible, for a Russian army to force a passage through Roumania to attack Bulgaria or Turkey in case of an Eastern war in which Roumania remains neutral.

Commerce.—The total value of imports in 1890 was 362,791,054 lei, and the total for exports was 275,958,415 lei. Of the imports, Germany furnished 109,252,000 lei, Great Britain 97,559,000 lei, Austria-Hungary 52,716,000 lei, France 39,648,000 lei, Belgium 18,926,000 lei, Turkey and Bulgaria 13,627,000 lei, Russia 8,664,000 lei,

Switzerland 8,011,000 lei, Italy 5,168,000 lei, Greece 904,000 lei, and other countries 8,316,000 lei. Of the exports 161,386,000 lei went to Austria-Hungary, 43,451,000 lei to Belgium, 17,196,000 lei to France, 12,605,000 lei to Germany, 11,610,000 lei to Italy, 9,516,000 lei to Turkey and Bulgaria, 8,913,000 lei to England, 4,583,000 lei to Russia, and 6,653,000 lei to other countries. The imports of textiles amounted to 155,000,000 lei; metals and metal manufactures to 64,500,000 lei; fruits, legumes, etc., 24,300,000 lei; hides, skins, and leather to 20,300,000 lei; minerals, glass, and crockery to 16,500,000 lei; paper manufactures to 13,800,000 lei; drugs and dyes to 9,300,000 lei. Among the exports, cereals stand for 226,100,000 lei of the total value, and fruits for 26,100,000 lei; animals and animal produce for 6,400,000 lei; textile materials for 4,600,000 lei; and all others amounted to 11,800,000 lei.

The vessels entered at the Roumanian ports in 1889 numbered 30,807, of 8,078,938 tons, while 30,586, of 8,789,894 tons, were cleared. The merchant marine consisted of 18 steamers, of 840 tons, and 105 sailing vessels, of 11,040 tons.

Communications.—The state railroads open to traffic in 1891 had a total length of 2,493 kilometres. There were 546 kilometres in process of construction, and 1,009 kilometres more were in contemplation.

The post-office in 1889 transmitted 13,110,372 letters, 3,927,093 post-cards, and 6,739,642 inclosures of printed matter. The receipts were 3,463,462 lei from the post-office, and 2,471,113 lei from the telegraph service, and the expenses of both were 4,015,191 lei. The telegraphs in 1890 had a total length of 5,490 kilometres, with 11,797 kilometres of wire. The number of domestic telegrams sent during the year was 966,570; of external telegrams, 346,079; of telegrams in transit, 44,333.

European Commission of the Danube.—The receipts of the International Danubian Commission, which sits at Galatz, were 3,468,607 francs for 1890, and the expenses were 2,265,716 francs. The debt was paid off before June 30, 1887, and the commission at the end of 1890 had a reserve fund of 1,000,000 francs and 509,473 francs in pension funds laid by. The number of steamers cleared at the Sulina mouth of the Danube during 1890 was 1,303, of 1,449,257 tons, and the number of sailing vessels was 525, of 90,188 tons, making a total of 1,828 vessels, of 1,539,445 tons, exclusive of passenger steamers. Of the total number 778, of 983,862 tons, were English; 235, of 164,993 tons, were Greek; 417, of 81,585 tons, were Turkish; 109, of 80,560 tons, were Austrian; 55, of 61,674 tons, were French; 60, of 58,560 tons, were Italian; and the rest were chiefly German, Russian, Norwegian, and Dutch. The exports of wheat in 1890 were 4,652,000 quarters; of rye, 468,000 quarters; of maize, 3,578,000 quarters; of barley, 1,283,000 quarters.

Politics.—The ministry, at the opening of 1891, was composed as follows: Gen. G. Mano, President of the Council and Minister of Justice; T. Rosetti, Minister of Justice, and *ad interim* of Public Instruction and Worship; A. Lahovary, Minister of Foreign Affairs; M. Germani, Minister of Finance; A. Marghiloman, Minister of Public Works; G. G. Peucesco, Minister of Agri-

culture, Industry, Commerce, and Domains; Gen. M. Vladesco, Minister of War. The Conservative and Junimist leaders, who by various combinations sought to replace the homogeneous administration of Bratiano, were divided on questions both of home and of foreign policy. The Russophile sentiment, which had no prospect of being realized while the National Liberals were in power, was represented in the new ministerial combinations; but so also was Bratiano's policy of drawing near to the Triple Alliance, which the Russophiles sought to discredit by calling it the personal policy of the King. They looked to Russia as a helper through whose aid Roumanian independence, so far from being extinguished, would be consolidated by the annexation of the Roumanian part of Hungary and the extension of Roumanian protection over the Wallachian communities in Old Servia, Macedonia, and Albania. An Irredentist agitation was started regarding oppressions suffered by the Roumanians of Transylvania at the hands of the Magyars. In domestic affairs some of the members of the old Boyar party were inclined to accept the democratic projects of the Junimists or Young Conservatives and others to ally themselves with the seceding Liberals. The Cabinet was occupied during the early part of 1891 in working out a new tariff, which was adopted and went into force on July 1, 1891, till which date the commercial conventions with various countries were prolonged. The commercial war with Austria-Hungary was abandoned, and low fiscal rates of duty were placed on all articles except a few that compete with industrial products of Roumania, which were subjected to high protective duties. The Junimist leader, Carp, was invited to join the ministry, but declined, because Gen. Mano would not agree to a dissolution of the Senate, which was opposed to reform projects. On Feb. 26 the ministry was defeated in the Senate on an educational bill, and on March 3 a new ministry was formed through a combination of the Catargi and Vernesco groups, in which the Austrophile Junimists had no place. It consisted of the following members: President of the Council, without a portfolio, Gen. J. E. Floresco; Minister of the Interior, Lascar Catargi; Minister of Finance, G. Vernesco; Minister of Foreign Affairs, C. Esarco; Minister of Public Works, C. Olanesco; Minister of Agriculture, Ilario Isvorano; Minister of Education and Worship, G. D. Theodoresco; Minister of War, Col. Jacques Lahovary. Although composed of Russophile elements, the ministers announced that they would adhere to the foreign policy of their predecessors. The Chamber, on considering the ministerial declaration on March 5, passed a vote of censure, and the King granted to Catargi and his friends the privilege of dissolving the Chamber of Deputies and directing the new elections, which were held in April. In the electoral campaign the Junimists and the Liberals coalesced on a common agrarian platform advocating the distribution of crown lands among the peasantry and the establishment of agricultural banks and of schools and colleges. Notwithstanding their powers of official pressure the Liberal-Conservative Ministerial party failed to secure for itself a majority the seats in the

Chamber, yet it obtained a working majority in the new Chamber, which was convoked in extraordinary session on May 11, by arrangements with independent members. The Minister of War secured a credit of 45,000,000 lei for the completion and armament of the fortifications, thus giving offense to the Czar, whose minister remained away from the celebration of the twenty-fifth anniversary of the King's reign. In June a question arose regarding a contemplated marriage of Prince Ferdinand that affected the dynasty and gave concern to the ministers and the politicians out of office, who were also consulted by the King in regard to the betrothal of the heir to the throne to Helene Vacaresco, a Roumanian lady who was a companion and *protégée* of Queen Elisabeth. The Prince declared that he would renounce his rights to the succession rather than give up the idea of marrying the lady of his choice. The ministers and other statesmen said that he could not succeed to the throne if he married a member of a family that was involved in Roumanian party politics. The common people were pleased with the thought of having a Roumanian Queen. Queen Elisabeth strove to counteract the opposition of the courtiers and politicians until she was prostrated by the excitement of the conflict, and went to Italy to recover from a nervous malady that attacked her, accompanied by Helene Vacaresco. The King was advised to obtain a divorce, or have his wife placed in seclusion, as a way out of the dilemma, but said he would rather abdicate. He went to Italy, and finally persuaded the Queen and his nephew to renounce the project of the marriage. The Catargi and Vernesco groups could not work harmoniously, and on July 13, to prevent open conflicts and a vote of censure, the extraordinary session was closed. On Aug. 2, Theodoresco went out of the Cabinet, and was succeeded by Prof. Pony. The Vernesco section was thereby left in the minority. The friction continued until Vernesco and his followers retired, and Catargi formed a Conservative ministry of the following composition: President of the Council and Minister of the Interior, L. Catargi; Minister of Domains, Gen. Mano; Minister of Foreign Affairs, Alexander Lahovary; Minister of Finance, A. Stirbez; Minister of War, Gen. Lahovary; Minister of Public Works, C. Olanesco; Minister of Justice, Sturdza Skejano; Minister of Public Instruction, Demeter Jonesco. The ministers were sworn in on Dec. 9. The Conservatives alone could not command a majority. The new Cabinet was defeated on a vote of confidence in the Chamber. But the King was unwilling to trust the weak and discredited National Liberal party with the control of the elections that were to take place in February, 1892, and therefore Catargi was allowed another chance. After long negotiations he came to an agreement with the Junimists led by P. Carp, accepting their programme of agrarian and other reforms. Gen. Mano, Sturdza, and Stirbez retired, and on Dec. 30 the Cabinet was reconstructed by the admission of Carp as Minister of Domains, Commerce, and Agriculture; of his disciple T. Tonesco as Minister of Education; of Germani as Minister of Finance; and of A. Marghiloman as Minister of Justice.

RUSSIA, an empire in northern Europe and Asia. The legislative and executive powers are united in the autocratic hereditary monarch of the Romanoff-Holstein-Gottorp family, in which the dynastic succession is through the male line in the order of primogeniture and through female descendants in default of male successors. The reigning Emperor or Czar is Alexander III, born Feb. 25, 1845, who succeeded to the throne at the death by assassination of his father, Alexander II, on March 13, 1881. The heir-apparent is the Czar's eldest son, the Grand Duke Nicholas, born May 18, 1868. The Czar exercises the powers of government through the medium of four consultative and administrative bodies: (1) The Council of State, which examines and passes upon the budget and elaborates the projects of law that the Czar desires to have enacted; (2) the Ruling Senate, which promulgates the laws and is the supreme court of civil and criminal judicature; (3) the Holy Synod, composed of the metropolitan bishops of Kieff, Moscow, and St. Petersburg, the Exarch of Grusva, four or five temporary members chosen from the episcopate, two representatives of the secular or married clergy, one lay member, the superior procurator, whose duties are to see that the decisions of the body, which embraces all affairs of religion, are in harmony with the laws of the empire; (4) the Committee of Ministers, who are the immediate advisers of the Czar. The following were the ministers in office in 1891: Gen. Count Vorontzoff-Dashkoff, Minister of the Imperial House; Nicholas Carlovich de Giers, Minister of Foreign Affairs; Gen. Vannoffsky, the Czar's aide-de-camp, Minister of War; Vice-Admiral Tchikhatchoff, Minister of the Navy; Privy Councilor Durnovo, Minister of the Interior; Privy Councilor Delyanoff, Minister of Public Instruction; Privy Councilor Vyshnegradsky, Minister of Finance; Privy Councilor Manassein, Minister of Justice; Privy Councilor Ostrovsky, Minister of Domains; Privy Councilor von Hübbenet, Minister of Public Works and Railways; Privy Councilor Filipoff, Chief of the Department of General Control. The post of Secretary of State for Finland has been vacant since the death of Baron Brunn in 1888.

Area and Population.—The area of the Russian Empire, according to the calculations of Gen. Strelbitzky, is 8,660,437 square miles. The European provinces of Russia have a superficies of 1,902,227 square miles; Poland, 49,157 square miles; the Grand Duchy of Finland, 144,255 square miles; the Caucasus, 182,457 square miles; the Khirghiz Steppe, with Lake Aral, 755,793 square miles; the Caspian Sea, 169,381 square miles; the trans-Caspian territory, 214,237 square miles; Russian Turkestan, 409,414 square miles; western Siberia, 870,818 square miles; eastern Siberia, 3,044,512 square miles; the Amur region, 888,830 square miles; Saghalien, 29,336 square miles. The Governments of European Russia were estimated in 1885 to contain a population of 85,395,209, divided into 42,999,324 males and 42,895,885 females. An estimate for 1890 makes the population, not including troops, of the kingdom of Poland 8,256,562, of whom 3,977,406 are males and 4,279,156 are females. The population of the Caucasus was estimated at 7,284,567 in 1885,

consisting of 3,876,868 males and 3,407,699 females; that of Siberia and the Amur region was estimated in the same year at 4,313,680, and that of Central Asia, including the Steppe, at 5,327,098. The number of marriages in European Russia in 1888 was 804,084; of births, 4,251,473; of deaths, 2,749,085; excess of births, 1,502,388. In Poland the number of marriages was 67,392; of births, 334,268; of deaths, 204,031; excess of births, 130,237. The population of St. Petersburg, the capital, in December, 1890, was 956,226; that of Warsaw in the same year was 443,426; Moscow in 1885 had 746,469 inhabitants, Odessa 240,000, Riga 175,332, Khar-koff 171,416, Kieff 165,561, Kasan 139,915, Saratoff 122,826, Kichineff 120,074, Vilna 102,845, and Lodz in 1890 had 125,227.

Religion.—The Russian branch of the Greek Orthodox Catholic Church has been governed by its independent directing body since Peter the Great established the Holy Synod with the consent of the Patriarchs of Constantinople, Jerusalem, Antioch, and Alexandria. The Russian Church is organized in 60 bishoprics, of which 48 are in European Russia, including the northern Caucasus; three of these have the rank of Metropolitan Archbishops, but exercise no authority beyond the limits of their sees. Of the other 12 bishoprics 6 are in Siberia, 4 are in trans-Caucasia, 1 in the Aleutian Islands, and 1 embraces the territory of Alaska. When a bishopric becomes vacant the Czar appoints the bishop, selecting one of three names submitted by the Holy Synod. The clergy constitute one of the four classes into which the population is divided. There are two distinct classes: (1) The celibate or monastic clergy, called the "black" clergy, who fill all the important ecclesiastical offices, and are the authorities and preservers of the traditions and forms of the Church; and (2) the "white" clergy, who are educated at the expense of the state in the seminaries at St. Petersburg, Moscow, Kieff, and Kasan, and must marry before they can receive an appointment. There are, according to the latest statistics, 1,418 archpriests, 34,345 priests, 6,810 deacons, and 48,371 assistants. Those who fail in the examination for the priesthood enter the diaconate, or, if they fall below the standard for that division of the clergy, become psalm-singers or assistants. The monastic system stands in high repute, and the chief occupation of the monks, of whom there were 18,128, including novices, in 1889, is to go through liturgical and devotional exercises. The formalism of the orthodox worship and the debasement and immorality of the "white" or parochial clergy have, in spite of persecution, driven a large proportion of the people into the schismatic sects. Of these, the most important are the Raskol dissenters, estimated at 14,000,000 souls, and the Stundists, who number about 2,000,000.

Finances.—The chief sources of revenue are direct and indirect taxes, state domains and salt mines, and the salt and tobacco monopolies. In 1890 the ordinary revenue was 943,686,000 rubles, and the extraordinary revenue 103,687,000 rubles, a total of 1,047,373,000 rubles, which exceeded the budget estimated by 99,504,000 rubles. The ordinary expenditures were 877,-

780,000 rubles, and the extraordinary 178,732,000 making a total of 1,056,512,000 rubles, which was 108,643,000 more than the estimated amount. From direct taxes the receipts were 89,184,000 rubles; from indirect taxes, 335,987,000 rubles; from monopolies, 34,228,000 rubles; from domains, etc., 85,354,000 rubles; other receipts, 198,933,000 rubles. The ordinary expenditures included 262,684,000 rubles for the public debt, 2,208,000,000 rubles for the superior governing bodies, 12,098,000 rubles for the Holy Synod, 10,560,000 rubles for the Ministry of the Court, 4,811,000 rubles for the Ministry of Foreign Affairs, 228,110,000 rubles for the Ministry of War, 40,693,000 rubles for the Ministry of Marine, 109,214,000 rubles for the Ministry of Finance, 24,249,000 rubles for the Ministry of Domains; 76,354,000 rubles for the Ministry of the Interior, 22,639,000 rubles for the Ministry of Public Instruction, 56,290,000 rubles for the Ministry of Communications, 22,861,000 rubles for the Ministry of Justice, 3,873,000 rubles for the Control Office, and 1,136,000 rubles for the imperial stud. The ordinary receipts for 1891 were estimated in the budget at 897,198,000 rubles; *recettes d'ordre*, 3,558,626 rubles; extraordinary receipts, 13,750,139 rubles; funds available for covering the deficit, 47,794,812 rubles; total, 962,302,521 rubles. The estimate of the ordinary expenses was 895,330,395 rubles; *dépenses d'ordre*, 3,558,626 rubles; extraordinary expenses, 63,413,500 rubles; total, 962,302,521 rubles. Including the Polish debt and the various railroad loans, the Government, on Jan. 1, 1891, owed 1,008,118,100 rubles payable in specie, 2,845,291,000 rubles payable in paper currency, 14,100,000 guilders borrowed in Holland, £21,997,900, and 545,984,000 francs. The expenditure on the debt in 1891 was 256,742,041 rubles.

The Army.—The young men of European Russia are required to serve five years in the active army, and for thirteen years more they belong to the reserve, and then for five years in the first ban of the territorial army. In Turkistan and the Amur region and for the marine troops, the period of active service is seven years, and for the northern Caucasus and the trans-Caspian territories three years. The men of the reserve are obliged to exercise twice for six weeks. Men who escape service in the permanent army in the drawing of lots, as well as those who have passed through the reserve, form part of the first ban of the territorial army till they are forty-four years old; they may be called out for six weeks' drill up to the age of twenty-five, and in time of war are used to complete the permanent army. The second ban is composed of those who are not fit to serve in the regular army. The Cossacks pass through a preparatory training for three years in their native villages, then perform four years of active service in the first ban, after that are inscribed in the second ban for four years, and may be called out to exercise three weeks annually, belong for the succeeding four years to the third ban, which may be called once into camp for three weeks, and for five years longer are enrolled in the category of depot troops, and as such may be drawn into the service to complete the armed forces in case of war. The clergy are entirely exempt, and physicians, veterinarians, and pharmacists are

not called on to serve in time of peace. Since 1890 the annual contingent of recruits has been 260,000, besides 2,400 Cossacks of the Caucasus, and the number of men of the first ban of the territorial army called out for the annual exercises has been fixed at 100,000.

The peace effective of the Russian army is as follows: 888½ battalions of infantry, numbering 15,764 officers and 429,383 men; 356 squadrons of cavalry, consisting of 2,262 officers and 59,916 men; 350 batteries of field artillery, with 2,073 officers and 60,787 men; 44 companies of engineers, with 772 officers and 23,547 men; 18 battalions and 84 parks of military equipages with 428 officers and 7,254 men; 125 battalions and 33 batteries of reserve troops, having 4,225 officers and 76,280 men; 28 infantry battalions, 54½ battalions of foot artillery, and five siege batteries of fortress troops, with 1,742 officers and 40,501 men; 56 squadrons and 2 batteries of depot troops, with 202 officers and 4,836 men; 6½ battalions of Cossack infantry, numbering 150 officers and 4,956 men; 11 squadrons and 275 sotnias of Cossack cavalry, numbering 1,912 officers and 44,712 men; 20 batteries of Cossack horse artillery, having 100 officers and 3,340 men; and 28 sotnias of Caucasus militia, numbering 71 officers and 3,358 men. The total strength is 30,561 officers and 787,372 men, or 818,033 combatants, with 155,537 horses. The war effective, not counting the territorial army and the Cossack troops of national defense, is 40,739 officers and 2,371,007 men, a total of 2,420,746, with 835,863 horses.

The Navy.—The Baltic fleet in 1891 comprised 37 armored vessels, including 3 of 11,000, 8,800, and 6,590 tons, not yet completed; 32 unarmored fighting ships; 51 other steamers, and 114 torpedo boats. In the Black Sea the naval force consisted of 8 armored vessels, including 1 in course of construction, 21 unarmored vessels, 12 unarmed steamers and 36 steam sloops, and 25 torpedo boats, making in all 102 vessels, exclusive of the volunteer fleet of Odessa. In the Caspian, 8 armed steamers and 7 others are maintained, and in Siberia there are 34 vessels, including 19 gunboats and 8 torpedo boats. On Oct. 20, 1891, three new ironclads were launched at St. Petersburg. One is the "Navarin," a barbette battle-ship of 9,476 tons displacement, propelled by twin screws of 9,000 horse-power, having a partial belt of 16-inch armor, and intended to mount two 52-ton guns in each barbette, besides eight 6-inch and ten quick-firing guns, and to be fitted with 6 torpedo tubes. The other two are belted gun vessels of 1,500 tons, to be armed each with one 9-inch, one 6-inch, and eight quick-firing guns, and with two torpedo-discharging tubes.

Commerce.—The value of the imports from European countries in 1890 was 361,400,000 rubles, not including precious metals; from Finland, 13,400,000 rubles; from Asia, 41,300,000 rubles. The exports of merchandise to European countries were 610,400,000 rubles in value; to Finland, 16,700,000 rubles; to Asiatic countries, 76,800,000 rubles. The total value of imports was 416,069,000 rubles, of which Germany furnished 114,635,000; Great Britain, 92,935,000; the United States, 53,393,000; China, 29,060,000; Austria-Hungary, 17,802,000; France, 17,254,000;

Persia, 11,632,000; Italy, 9,153,000; Turkey, 7,961,000; Belgium, 7,085,000; Sweden and Norway, 6,436,000; and the Netherlands, 4,858,000 rubles, about 44,000,000 rubles coming from Roumania, Denmark, Greece, and all other countries. The total value of the merchandise exports was 703,937,000 rubles, of which Great Britain took 203,663,000; Germany, 177,940,000; France, 48,366,000; Holland, 43,538,000; Italy, 30,338,000; Austria-Hungary, 30,245,000; Belgium, 27,388,000; Turkey, 16,772,000; Sweden and Norway, 12,650,000; Persia, 10,927,000; Denmark, 8,322,000; Greece, 8,303,000; Roumania, 7,192,000; China, 1,189,000; the United States, 927,000; and all other countries, 76,177,000 rubles. The imports and exports through the Russian ports of the Baltic were 171,400,000 and 179,100,000 rubles respectively; across the Finland frontier, 13,400,000 and 161,700,000 rubles; across the European land frontiers of Russia, 135,200,000 and 165,800,000 rubles; by the Black Sea ports, 53,800,000 and 259,800,000 rubles; by the White Sea ports, 1,000,000 and 5,700,000 rubles; across the Asiatic frontiers, 41,300,000 and 76,800,000 rubles. The chief imports by way of the European frontiers were textiles of the value of 119,468,000 rubles; metal wares and machinery, 35,028,000; raw metals, 26,498,000 rubles; tea and coffee, 24,358,000 rubles; dyeing materials, etc., 14,590,000 rubles; coal, 12,454,000 rubles; hides, skins, and fur skins, 11,281,000 rubles; apparel and trimmings, 8,954,000 rubles; alcoholic beverages, 8,988,000 rubles. The chief exports by the way of the European frontiers were cereals of the value of 308,622,000 rubles; textile materials and manufactures, 93,738,000 rubles; lumber, 53,024,000 rubles; linseed, 45,119,000 rubles; animals, 10,832,000 rubles; hides, skins, and peltry, 10,697,000 rubles; bristles, 10,477,000 rubles; sugar, 6,727,000 rubles; alcoholic beverages, 6,070,000 rubles; petroleum and naphtha, 4,129,000 rubles; metals, 2,231,000 rubles. The chief imports from Asia were tea of the value of 16,154,000 rubles, fruits and legumes for 3,554,000 rubles, textile materials for 2,325,000 rubles, and tissues for 2,433,000 rubles. The exports to Asia consisted of cereals for 25,311,000 rubles, tissues for 4,332,000 rubles, textile materials for 3,041,000 rubles, and a great variety of other merchandise. The imports of precious metals from Europe were 20,663,000 rubles, and from Asia 2,464,000 rubles, while the exports to Europe were 17,832,000 rubles, and to Asia 3,096,000 rubles.

Navigation.—At the ports of the Baltic in 1889 there were 3,541 vessels entered with cargoes and 2,790 in ballast, while 5,660 were cleared with cargoes and 586 in ballast. In the White Sea ports 311 were entered and 623 cleared with cargoes, and 320 entered and 2 cleared in ballast. In the Black Sea and the Sea of Azov 1,752 were entered with cargoes and 4,757 cleared, while 3,876 were entered in ballast and 913 cleared. In the Caspian Sea 792 were entered and 684 cleared with cargoes, and 139 entered and 251 cleared in ballast. Of 13,521 vessels, the total number entered at all the ports, 9,465 were steamers, and of 13,476 vessels cleared, 9,457 were steamers. Of the vessels entered, 2,415 were Russian, 4,174 English, 1,720 German, 1,479 Swedish and Norwegian, 895 Danish, 740 Turk-

ish, 642 Austrian, and 146 Dutch, etc. The merchant marine in 1887 numbered 2,614 vessels propelled by sails, of 361,572 tons, and 357 steam vessels, of 130,458 tons.

Railroads, Posts, and Telegraphs.—The Russian network of railroads on Sept. 1, 1890, had a total length of 26,554 versts or 28,327 kilometres, not including the railroads of Finland or the trans-Caspian line of 1,433 kilometres.

The post-office in 1889 forwarded in the internal service 163,500,000 letters, 19,307,000 postal cards, 21,708,000 pieces of printed matter, and 12,081,000 money letters of the declared value of 15,496,332,000 francs. In the international service the number of letters was 24,316,000; of postal cards, 3,725,000; of printed inclosures, 10,039,000. The receipts were 79,773,924 francs, and the expenses, including those of the telegraph service, were 97,313,972 francs. The receipts from telegraphs were 40,551,108 francs. The state telegraph lines had a total length of 115,900 kilometres, with 224,093 kilometres of wire. The number of domestic dispatches was 8,876,254; of international dispatches, 689,477 sent, 730,925 received, and 146,872 in transit; of official dispatches, 628,054.

Finland.—The Grand Duchy of Finland is a constitutional monarchy which was united with Russia under the same sovereign in 1809. The Constitution of 1772 and 1789 was confirmed by Alexander I in a manifesto issued on March 27, 1809, and subsequently on Dec. 24, 1825, March 3, 1853, and March 14, 1881, in the proclamations of Nicholas I, Alexander II, and Alexander III. In the National Assembly the four estates of the nobility, the clergy, the peasantry, and the towns are represented. The Governor-General and commander-in-chief of the military forces is Count T. Heyden. The population on Dec. 31, 1889, was 2,338,404, of which number 1,152,111 were males and 1,186,293 females. Helsingfors, the capital, had 65,535 inhabitants. The number of marriages in 1889 was 16,099; of births, 77,881; of deaths, 45,679; excess of births, 32,202. The receipts of the Government in 1891 were estimated in the budget at 55,603,138 Finland marks, the value of the mark being the same as that of the French franc. The clergy, superior judges, and certain civil officials collect their pay directly without the intervention of the treasury. The debt on Jan. 1, 1891, amounted to 82,129,697 marks. The value of the external commerce in 1890 was 140,600,000 marks for imports and 92,400,000 marks for exports. Of the imports, 47,300,000 marks came from Russia, 44,800,000 marks from Germany, 23,000,000 marks from Great Britain, and 12,300,000 marks from Sweden and Norway. Of the exports, 36,400,000 marks went to Russia, 17,700,000 marks to Great Britain, 11,000,000 marks to Denmark, 7,300,000 marks to Sweden and Norway, and 6,000,000 marks to Germany. Chief among the imports were cereals of the value of 20,800,000 marks, coffee of the value of 12,500,000 marks, iron goods of the value of 9,700,000 marks, and next in order woolen goods, cottons, sugar, and machinery. The principal exports were lumber of the value of 36,400,000 marks, butter of the value of 13,600,000 marks, and paper of the value of 8,600,000 marks. The railroads, on Sept. 1,

1891, had a total length of 1,876 kilometres. The merchant marine in 1889 consisted of 1,799 sail vessels, of 235,161 tons, and 336 steamers, of 17,454 tons. There were 16,056 vessels, of 1,985,147 tons, entered and 16,474, of 2,027,111 tons, cleared at the ports of Finland during 1890.

The Trans-Siberian Railroad.—The project of a railroad across Siberia has been in contemplation for twenty years. In 1887 a commission was appointed by the Emperor to study the subject, and preparatory surveys were made. The commission unanimously recommended the construction of the line both on strategical and on commercial grounds. The Government has decided to build the line at its own expense, rejecting offers of foreign capital, unless, perhaps, Gen. Annenkoff's plan for enlisting French capital be ultimately adopted. The railroad is expected to benefit Siberia immensely, to promote colonization, to make Asiatic Russia a source of revenue instead of a drain on the imperial treasury, and to consolidate and strengthen Russian extension in Asia. The middle route, rather than the northern or the southern routes that were proposed, has been adopted. The line starts from Zlatausk and Miask, where the European line terminates at the Ural mountains, and will run close to the fifty-fifth parallel of north latitude as far as the Yenesei river, with branches about 60 miles long to connect it with the important towns of Tomsk and Omsk. Thence it will take a more southerly course to Irkutsk, follow the southern shore of Lake Baikal and the valley of the Seeling river, cross the valleys of the Lena and the Amur to Lake Collan, where excellent coal has been found, thence run eastward to the steamboat station of Srjetinsk on the Amur, and along that river southeastward to Khabarofka, then turn southward along the right bank of the Ussuri to Graffsky, and terminate at the port of Vladivostok in latitude 43°. The total length is 5,613 miles. The line has been surveyed, with the exception of 828 miles at the western end and 1,525 miles between Srjetinsk and Graffsky. The section from Miask to the river Obi, crossing the rivers Tobal, Ishim, and Irtysh, and passing near the towns of Koorgan, Tukulinsk, Kaensk, and Kolivan, is expected to cost \$33,500,000, or about \$33,880 a mile. The section of 1,114 miles from the Obi to Achinsk will cost \$38,820,000, or \$34,850 a mile. The Lake Baikal section of 194 miles and the trans-Baikal section of 669 miles present many engineering difficulties, as they pass through a mountainous country; the cost is estimated at \$13,000,000, or nearly \$67,000 a mile for the one, and \$31,160,000, or \$36,580 a mile for the other. The section from Srjetinsk to Graffsky, though it has not been surveyed, passes through a country well enough known to permit an estimate of the expense, which will not exceed \$49,780,000, or \$32,620 a mile. The last section, from Graffsky to Vladivostok, 255 miles, will cost nearly \$50,000 a mile, or \$12,750,000 altogether. This section and the short length of 60 versts across the Ural mountains from Miask to Chelabinsk, it was decided, should be built first and begun in 1891. Of 7,000,000 rubles allotted to railroad construction in the budget, 500,000 rubles were applied to preliminary work on the western end, 2,900,000 rubles to construction of the Ussuri section, 200,000 ru-

bles to surveys between Chelabinsk and Tomsk, and 100,000 rubles to surveys from Graffsky to Khabarofka. For the Ussuri section it was necessary to transport all the materials by sea from Russia to Vladivostok. The first rail was laid by the Czarevich on May 24, 1891.

The New Loan.—Formerly Russian securities were largely held in London. In recent times Berlin has been the banking center for Russian commerce and the chief source of Government loans. The financial relations between Prussia and the Russian Empire have been of the most intimate character for many decades. In 1884 the Seehandlung, which is an official financial institution in Prussia, headed the syndicate which placed a loan of \$75,000,000. In 1886, when the Russian scare in England caused British investors to unload enormous quantities of Russian bonds on the Continental bourses, the Berlin financiers sustained the market, preventing a heavy fall, and absorbed the Russian funds at cheap prices, thereby gaining what was considered a victory over the London bankers. Up to 1887, the year in which Vyshnegradsky became Russian Minister of Finance, the investments of German capital in Government funds, preference shares of guaranteed railroads, and other Russian securities, were estimated at \$1,000,000,000. At that time a coolness arose in the political relations between Russia and Germany, in the course of which Chancellor von Bismarck instigated a campaign against Russian credit abroad. It still stood so high in Berlin that he failed to accomplish his purpose, until he practically prohibited transactions in Russian securities by refusing to allow the Imperial Bank to accept them as collateral for advances. In spite of a constant war carried on in the inspired German and English press, which attacked the good faith of the Russian Government, saying that loans raised for the conversion of debt or for reproductive works were used for augmenting and equipping the army or for the construction of strategic railroads, and that interest on the debt was paid out of fresh loans, the credit of the Russian Government has steadily improved under the management of M. Vyshnegradsky, who established a bond of financial friendship with France when he found the markets of London and Berlin closed to him. The German market was not entirely closed, because German investors were most familiar with the strength of the financial position of Russia, and feared only the consequences of a war. Many Germans held on to their Russian investments, and when loans and railroad bonds bearing a high rate of interest were converted, assistance was received from the German money market, although the main supply of money came from France. In 1889 and 1890 loans to the amount of 1,800,000,000 credit rubles were taken by French syndicates. By degrees the German investments in Russian securities found their way into France, until the aggregate holdings of the French reached about 2,500,000,000 rubles. The English have persistently refused to subscribe to the new Russian loans; but the French support was so efficient that few governments have been able to borrow more cheaply. In 1891 the Russian Finance Department called for a new 3-per-cent. gold loan of 500,000,000 francs for the construction of rail-

roads. The Rothschilds, who for generations have held the prescriptive right to act as the chief financial agents of the Russian as well as of other governments which apply for loans in the great money centers of Europe, agreed in May to take the whole loan at 81½ and issue it at 84, but stipulated that they should use their discretion as to the time and manner of placing it on the market. The Paris branch of the Rothschilds acted alone in the transaction. The Russian minister would not agree to the terms, because he feared that they might keep the bonds in their possession to use for their own purposes at some future juncture as a means of depressing Russian credit. The English agitation regarding the Russian persecution of the Jews was renewed at this juncture, and at the request of Baron Rothschild, of London, the French firm announced that it would have no financial dealings with the Russian Government until it ceased deporting Jews from the interior to the western pale. In France the effervescence of political feeling caused by the renewal of the Triple Alliance and the Franco-Russian *rapprochement*, that was afterward signalized by the visit of the French squadron in Cronstadt, created a situation in which the refusal of French bankers to assist Russia seemed an act of subservience to Germany and treason against France. Encouraged by the newspapers, some of the financiers of Paris proposed to place the loan by open subscription in defiance of the money power of the Rothschilds. After the Cronstadt meeting the French public clamored for the loan, and the Russian Government had immediate need of money to draw on abroad in order to aid traders who were unable to meet their foreign engagements owing to the failure of the crops. An arrangement was therefore made with the *Crédit Foncier*, the *Crédit Lyonnais*, and other financial institutions in France, and with the *Hopes of Amsterdam*, the Bank of Copenhagen, and a firm in London to take the loan at 80, and to open the books on Oct. 2 for public subscriptions at 79½, which yields on 3½ per cent. per annum. English subscriptions were desired merely for the purpose of obtaining quotations on the London Stock Exchange. When the Berlin houses of Mendelssohn and Robert Warschauer agreed to enter the syndicate the German press raised an outcry, and called on the Government to forbid them to invite subscriptions to a loan that would probably be used to arm an enemy. The Government declined to interfere officially, but nevertheless no bonds were offered in Berlin. The price was very little better than the German 3-per-cents., which were quoted at 84. In France, however, the Russian loan afforded a considerable profit as compared with French *rentes*, which were selling at 96. The French Government declined to allow the provincial agencies of the *Crédit Foncier* to advertise the loan, for that would give it an official character and give rise to much criticism abroad. The application of the loan was announced to be the repayment of advances for recent construction and the making of lines from Moscow to Kazan and from Kovrisk to Vorongé and the Petrozavodsk line. Advertised in France as the loan of the Russo-French alliance, it was subscribed for seven times over in that country alone. In Holland,

Denmark, and England and in Russia the takings were small. Soon after the allotments were made German bankers sent orders to sell Russian securities in Paris, and as they begun and continued to fall and Spanish and Italian stock also dropped, until a panic was feared, it was believed in Paris that the Rothschilds were bearing the market.

The Russification of Finland.—When the Finnish Diet was opened on Jan. 28, 1891, the President of the Upper House declared that the people were agitated by the fear of impending trouble and danger, and in the Lower House the Speaker, who represents the peasantry, said that a feeling of gloom and depression pervaded the land, but that the Finnish people nevertheless did not despair of preserving their legal and constitutional rights. These outspoken and significant expressions called forth a rescript from the Czar, in which he said that a false interpretation of the principles on which rest the relations of the grand duchy to the supreme authority had caused measures that he had proposed for obtaining a closer union of the grand duchy with the other parts of the empire to give rise to an excited state of feeling. The rights, privileges, special ecclesiastical order, and distinct laws of Finland have been maintained and in many particulars further developed since the country became an imperial Russian possession. Nevertheless the disagreement of certain statutes of Finland with the general laws of the state had given cause for a perverted conception of the significance of measures undertaken for objects common to all parts of the Russian state. Therefore he authorized the Governor-General to assure the people of Finland that he would preserve unimpaired the rights and privileges granted by Russian monarchs, and had no intention of changing the principles of the existing internal administration of the country. The contemplated measures aim at nothing more than fortifying the state relations between Finland and Russia. One of the institutions distinguishing the semi-independent administration of the grand duchy was the Committee for Finnish Affairs attached to the department of the Secretary of State for Finland in St. Petersburg. To the expressed regret of the Finnish press this consultative body, composed of two members delegated by the Finnish Senate and one nominated by the Emperor, was abolished from Oct. 1, 1891. To reassure his Finnish subjects the Czar visited Helsingfors in July, but was disappointed in not receiving an enthusiastic reception. In order to put a check upon the opposition of the Finnish press to the Government reforms, new and stringent regulations were issued whereby newspapers can be warned or suppressed without warning by the Governor-General, and stricter guarantees are required before permission to establish new papers or periodicals is granted. In October an imperial ukase was published putting in force various reforms designed to assimilate Finland to Russia. They provide that the Secretary of State for Finland shall submit to the Russian ministers for consideration all Finnish legislative proposals which affect the interests of Russia. Further, in future all imperial decisions and projects of law relating to Finland and all

bills to be laid before the Finnish Diet, as well as the resolutions and petitions of the Finnish Diet, are to be communicated to the Governor-General in the Russian language instead of in the native tongue. Another ordinance directs that only Russians who have graduated at a university or Finlanders who have had a superior education and thoroughly understand the Russian language shall be appointed to posts in the office of the Secretary of State, and in the Chancellery of the Governor-General.

Edicts against the Jews.—The Czar in the summer of 1890 issued edicts against the Jewish hucksters, money-lenders, and liquor-sellers in the interior of Russia, which were carried out with much harshness for a time, after which he delayed for some months his decision regarding the revival of the old law forbidding Jews to acquire a permanent residence outside the governments on the western border. In the beginning of 1891, on the recommendation of a commission appointed to inquire into the relations between the Jews and the state, he decided that the edict of removal should be carried out. In the beginning of February all the Jewish traders of the city and district of Novgorod were ordered to leave with their families. Newspapers which remonstrated against the policy of the Government were suppressed. The first guild of merchants in St. Petersburg had a legal right of residence, and the privilege of maintaining any number of Jewish servants, but holders of certificates of the guild who had no business of their own were expelled in April, and a general clearance of the Jewish population in the cities of central and eastern Russia was begun. They were expelled even from the trans-Caspian provinces and from the Caucasus. In Kieff Count Ignatieff banished artists and musicians. The decree for St. Petersburg included artisans, chemists, merchants of the second and third guilds, and money-changers. The sudden banishment of many thousands of Jews from Moscow and the decree ordering a great many more to leave within a month caused severe distress and suffering and a commercial crisis that involved all the Christian merchants. The Jews had to sell all their property for almost nothing. Hundreds applied for baptism in order to evade the decree. They were surrounded in their houses by soldiers and hurried off to the railroad, chained together sometimes like Siberian exiles. The authorities were at a loss whither to send a large proportion of them, for a great many families had lived in Moscow for generations and had no other domicile. Children were in many instances separated from parents and husbands from wives. It was only in Moscow that scandalous cruelties were practiced, and this was because the chief of police, after the removal of Prince Dolgorukoff, who had carried out none of the edicts, wished to rid the city of as many Jews as possible before the arrival of the Grand-Duke Sergius as Governor-General. But elsewhere laws were more strictly enforced than before. The law prohibiting Jews from owning or leasing land or acquiring manufacturing was extended to the whole empire outside the pale. In Kieff, Odessa, and other commercial towns where the trade is principally in the hands of Jews the authorities herded the

poorer Hebrews scattered over the districts in the *ghettos*, which became so crowded as to cause an exodus to Turkey and other countries. In the latter part of May a general order for the expulsion of all foreign Jews from southern Russia was issued, in consequence of which the poor Jews of Odessa and of the whole province of Kherson and of the Crimea and many in moderate circumstances realized what money they could in order to emigrate. In all the forcible expulsions the police used their discretion as to what Jews should be sent back to the pale, their orders being not to molest respectable persons following useful occupations, but to rid the towns of the destitute and inefficient, and of usurers and petty traders and those engaged in disreputable pursuits. The manner in which the decrees were carried out by corrupt officials produced a panic, and led to the emigration of great numbers besides those notified to depart. The regulations against the Jews were relaxed in July, but, owing to the crowding of them within the pale and the impending famine, the emigration continued. The German and Austrian authorities refused to admit such as were destitute; some were sent back as pauper immigrants from the United States; the Turkish Government would allow none to land at Jaffa or Beyrut who were likely to become a burden on the community; and the British consular agents gave warning that there was no work for them in England. Baron Hirsch, the Vienna capitalist who built the Turkish railways, offered to give \$15,000,000 to aid the exiles in finding new homes and especially to establish agricultural colonies, selecting the Argentine Republic as the most favorable country. Arnold White, who went to Russia to study the subject and report to him, found the Russian ministers anxious to further the plan of promoting emigration, and willing to countenance the formation of committees to supervise and direct the movement. At his instance they removed the regulation requiring every emigrant to go to the place in which he is inscribed as a resident and procure a passport, for which he had to pay a fee of 10 rubles. Mr. White visited the Hebrew agricultural colonies planted by the Czar Nicholas in the Government of Kherson, where he found that Jews, contrary to the view officially adopted in Russia, are capable of becoming industrious and skillful farmers. Baron Hirsch bought 7,000,000 acres of the best agricultural land in Argentina, on which he intends to settle 4,000 or 5,000 families of expatriated Russian Hebrews. He made an experiment with 400 picked subjects, who showed such aptitude that he is convinced that a taste for agriculture can be developed among people of his race. Every family will receive 150 acres of land, on which they will be supported for a year, and for which after another year they must pay a small rent. No member of the community will be allowed to trade or to sell anything except the products of his toil.

The persecution of the Jews was only part of the general policy instituted by M. Pobiedonostseff, Chief Procurator of the Holy Synod and other members of the Old Russian party who have the ear of the Czar, of harrying and crushing all foreigners and all dissenters from

the orthodox faith. The flourishing German manufacturers and agriculturists in southern Russia, German only by descent, were harassed until they were financially ruined by the officials. Polish engineers who had built and managed the Trans-Caspian Railroad were suddenly dismissed, and all Poles, Germans, Jews, and foreigners of all kinds who had settled in that part of the empire were incontinently driven out. Even the Mohammedan Tartars were oppressed in various ways and were not allowed to read the Koran, except in an expurgated translation. Among the new regulations affecting the German Lutherans of the Baltic provinces was one forbidding any but Russians from practicing law. The persecution of schismatics was redoubled in severity. The Stundists and Baptists of Kieff and other places were hunted out and banished to trans-Caucasia.

Famine.—The wheat and rye crops failed in 1891 in the provinces of Tula, Tamboff, Voronezh, Nijni Novgorod, Riazan, Simbirsk, Kursk, Orenburg, Penza, Samara, Saratoff, Kazan, and Viatka, and partly failed in Moscow, Kaluga, Orel, Ufa, Astrakhan, Kostroma, Kherson, Perm, Khar-koff, Tobolsk in western Siberia, and in others. It was estimated in the summer that the wheat crop was 25 per cent., or 50,000,000 bushels, short of the average, leaving 50,000,000 bushels, instead of the average of 100,000,000 bushels, for export, if the home consumption remained the same as in ordinary years. The rye crop was 30 per cent., or 180,000,000 bushels, less than the average crop of 600,000,000 bushels. An average of 60,000,000 bushels has been exported in past years to Germany, Austria, and other countries, and therefore if no rye was exported at all the people would have only about three quarters of the quantity usually consumed to sustain them till the summer of 1892, for the stocks left over were very small. With no crops to supply their staple food or barter for other necessities or pay their debts, the peasantry of the afflicted provinces were soon reduced to bankruptcy and want, and their position was made more desperate by rains, which caused the potatoes to rot and the ravages of the cattle disease. On Aug. 11 the Czar issued a ukase prohibiting the export of rye, rye-wheat with more than 8 per cent. of rye, or bran by way of the Black Sea or Baltic ports or the western land frontiers. The transport rates for wheat and potatoes to the necessitous provinces were compulsorily lowered on all the railroads. The prohibition of rye exports was felt severely in Germany, which in ordinary years imports rye largely from Russia and in this year had a very short crop. During the days that were left the Jewish merchants exported rye to Germany up to the full capacity of the railroads, and after the ukase went into force they sent it abroad in the form of bread until the practice was interdicted. By a second manifesto exports from Finland were forbidden. The spirit bounties were removed with the object of lessening the consumption of grain, potatoes, and Indian corn for distillation, and measures were taken to prevent rye in particular from being made into spirits. Already in August great numbers of people were without their usual food, and some died from starvation. They tried to nourish themselves with wild fruits and the seeds of weeds, or with

grass and leaves. In Simbirsk and Kazan they ate a bread made from ground straw and pig-weed. At Libau, Vilna, and Smorgoni peasants and poor Jews carried out the Czar's edict before the time by stopping rye that was being carted to the railroad and unloading it at the town hall. Similar grain riots took place at Orel, at Vitebsk, at Dünaburg, and other stations on the line leading to the frontier. The Government and the Zemstvos spent large sums in supplying seed for the next crop and food to keep the people through the winter. The industrious peasants of the valley of the Volga were reduced to the last stages of destitution before succor was brought to them, and whole villages perished before food, which was hurried forward before the freezing of the river, could be distributed. The extent of the famine-stricken area, embracing the central and southeastern provinces, was about 30,000 square miles, containing a population of 25,000,000 souls. The sum of 184,000,000 rubles was estimated to be what was required to keep this population from starving and to supply seed grain. This region comprises the greater part of the plain of Great Russia up to the Volga and the low plain east of that river. In the northern and middle section rye is the principal crop, and in the southern provinces wheat is grown and is eaten by the people. The greater part of the black soil is found in these provinces, which constitute the most fertile and one of the most thickly populated regions in the empire. The continental character of the climate, the scanty rain-fall, the prevalence of dry winds, and the absence of forests and mountains to check the wind and retain moisture make the effects of an inclement season widely felt. The winter of 1890-'91 was unusually cold; frosts occurred late in the spring when the ground was denuded of snow, and they were followed by a long drought with easterly winds. The cereal crops for the whole of European Russia and Poland aggregated 517,000,000 against an average of 645,000,000 hectolitres, leaving a deficit of 128,000,000 hectolitres, or nearly 20 per cent. The effect of the rye ukase was to prevent the export of about 50,000,000 hectolitres that would otherwise have gone abroad, but at the same time would have put 200,000,000 rubles in the pockets of the peasantry. The Government gave 24,000,000 rubles and afterward 55,000,000 more to the Zemstvos for relief purposes. The price of rye doubled. The prohibition of exports was extended to other cereals until Nov. 3, when the decrees were revoked. Merchants and all classes of the nobility made voluntary sacrifices, and the Zemskie Natchalniki, the heads of the local governing bodies, acted as agents of the Red Cross Society to distribute food, all the members of the Zemstvos and the country gentry aiding in the work. The entire population of the thirteen stricken provinces was under the inspection of these volunteer charity commissioners, who only gave relief, as far as they could discriminate, to those who were actually starving. Nearly everywhere the live stock had disappeared and barns were torn down for fuel. In the winter hunger typhus broke out.

The Question of the Dardanelles.—In the convention of London in 1841 the right of Turkey to close the Dardanelles to the war-ships and

troop transports of all nations was laid down, and in the Treaty of Paris, in 1856, it was confirmed. In April, 1891, the steamer "Kostroma," belonging to the volunteer fleet of Odessa, on its way to Vladivostok with workmen and materials for the Trans-Siberian Railway, on representations being made that she was a naval vessel, was detained by the Turkish authorities. The Russian ambassador at Constantinople protested, and a preliminary agreement was arrived at, which was embodied in a formal convention, signed in July, providing that vessels of the volunteer fleet flying the commercial ensign should be permitted to pass through the Bosphorus as merchant vessels, and that Russia need notify the Porte only in the event of such vessels car-

rying soldiers or war material. On Aug. 4 the "Moskwa," returning with 700 men on board, who were represented to be Russian soldiers, was detained. M. de Nelidoff again protested and demanded an indemnity, and the vessel was allowed to proceed. Two weeks later the same thing happened in regard to the "Kostroma." After an interchange of explanations an arrangement was reached by which the vessels of the volunteer fleet should be allowed to pass through the Bosphorus when taking out military escorts accompanying convicts to Saghalien or troops for the garrisons in eastern Asia on the application of the Russian ambassador, and to bring back troops whose time has expired on the declaration of the commander of the vessel.

S

SALVADOR, a republic in Central America. The Constitution vests the legislative power in a Congress consisting of the House of Representatives and the *Senaté*. The President, who possesses the executive power, is elected for four years by the direct vote of the nation. The President in office is Gen. Carlos Ezeta, who was proclaimed Provisional President by the army on June 22, 1890; elected by Congress on Sept. 11, 1890; and elected by the people for the full term, beginning March 1, 1891.

The area of the republic is estimated at 7,225 square miles. The population is twenty times as dense as in the rest of Central America, numbering 651,130, according to the census of 1886. San Salvador, the capital, had 16,327 inhabitants in 1888. The schools in 1888 had 21,101 pupils. The revenue in 1889 was \$4,070,342 in silver, and the expenditure was \$4,033,157.

Finances.—The revenue is raised chiefly by customs duties and monopolies. The chief items of expenditure were \$972,000 for the public debt, \$909,000 for the army, \$555,000 for public works, and \$336,000 for education. In 1890 the revenue amounted to \$4,153,000, of which \$2,612,000 were derived from customs, \$1,242,000 from the spirit monopoly, \$44,000 from stamps, \$24,000 from the powder and salt-peter monopolies, and \$231,000 from other sources. The total expenses for 1890 were \$5,442,000, of which \$2,758,000 were for the army, \$407,000 for the Interior Department, \$1,282,000 for the Ministry of Finance, \$153,000 for the Ministry of Justice, \$384,000 for public instruction, \$372,000 for public works, and \$91,000 for foreign relations. The internal debt in 1890 amounted to about \$7,500,000, and the foreign debt to \$1,500,000. The active troops number about 4,000, and the militia \$15,000.

Commerce and Communications.—The value of the imports in 1890 was \$2,401,000 against \$2,878,000 in 1889, \$4,076,000 in 1888, \$3,344,000 in 1887, and \$2,428,000 in 1886. The exports in 1890 were valued at a total sum of \$7,579,000, against \$5,489,000 in 1889; \$6,707,000 in 1888, \$5,243,000 in 1887, and \$4,755,000 in 1886. The chief articles of export in 1890 were the following: Coffee, \$4,269,000; indigo, \$1,053,000; sugar, \$290,000; tobacco, \$211,000; silver bars, \$204,000. There are 55 miles of rail-

road in operation. A contract to build a railroad through Salvador to Honduras was awarded to a French company by President Ezeta, and approved by Congress in June, 1891. A plan was accepted by the Government in October for a line between San Salvador and Santa Tekla, and a railroad from Santa Tekla and La Libertad was authorized at the same time, making an alternative route between the capital and the sea. During 1889 the three ports of the republic were visited by 355 steamers and 47 sailing ships. The length of the telegraph lines is 1,630 miles. The number of messages sent in 1889 was 495,689, including 182,278 official.

Political Events.—The election of Gen. Ezeta as President for the ensuing four years, and of his brother Antonio Ezeta, as Vice-President, was confirmed by the Congress, and they were inaugurated in the beginning of March, 1891. In the Cabinet appointed to mark the return to constitutional conditions, Antonio Ezeta retained the portfolio of the War Department, which he shortly afterward resigned in order to become general-in-chief of the army, Gen. Amaya succeeding him as Minister of War. The President and his supporters were compelled to be very watchful against a surprise, for their enemies in the country were numerous, and those who had fled to Honduras and Guatemala were busy planning a counter-revolution. The German Government recognized Ezeta, but simply as *de facto* head of the state. On May 6 Col. Molena and Gen. Bardales seized a part of the island of Amalpa and attempted to set up a rival government. Their plan was frustrated by Gen. Barrera, who, with Government troops, defeated the rebels before the re-enforcements that they expected could arrive, killing Gen. Bardales in the action. The treaty of peace with Guatemala was ratified by Congress in June. In an attempt to raise a new loan abroad President Ezeta had no success. On Sept. 9 and the succeeding days a large part of the country was shaken by a series of severe earthquakes, which destroyed buildings and caused forty deaths in the capital, and worked worse destruction in other towns, especially in Comasagua, where only eight houses were left standing.

As the year advanced, Gen. Ezeta had good reason to fear that the friends of the late Gov-

ernment would effect his overthrow. He was told that President Barillas of Guatemala had offered to Gen. Ayala and his friends arms, money, and men for a revolution in Salvador. The Salvadorian minister in Mexico appealed to the Mexi-

Guatemala, Gen. Alatorre, Mexican minister to Central America, threatened President Barillas with armed intervention if the hostilities between Guatemala and the existing Government of Salvador were renewed. President Ezeta

ILOPANGO VOLCANO, SAN SALVADOR.

can Minister of Foreign Affairs to interfere to prevent the revolution that Guatemala was suspected of fostering, and as the Mexican Government is opposed to the union of the Central American republics under the leadership of

showed how great were his fears by dismissing Gen. Amaya from the War Department and banishing Gen. Plazas and other persons. In September Dr. F. Galindo retired from the Ministry of Foreign Affairs, and was succeeded by Dr. Sal-

vador Gallegos. Dr. Geronimo Pou, former minister to Mexico, who was appointed by President Ezeta as his private secretary, also retired.

Detention of an American Steamer.—The Pacific Mail Steamship Company, whose steamers touch at all the ports between San Francisco and Panama, has been the chief means of developing the foreign trade of the Central American countries, from each of which it has received mail subsidies. The people of Salvador have often been dissatisfied with the charges and accommodations, and the men in power have been angry because they could extract no bribes from the company; yet, so long as there was no competition on the west coast, the officers of the company could defy their resentment. Recently three German lines running between Central America and Europe, and one running from the west coast to Mexico and China, have made the dictators of these republics more independent, and have given satisfaction to the planters by loading and sailing at their convenience, and by lowering freight rates to the extent of one or two cents on every pound of coffee. When the "City of Panama," one of the smaller vessels of the Pacific Mail Company, entered the port of La Union, President Ezeta, learning that she had on board Dr. Ayala, Gen. Letona, Gen. Rivas, and Dr. Luciane Hernandez, to whom President Barillas had offered asylum and who were on their way to Guatemala, demanded that they should be given up to the Salvadorian authorities. Capt. White, master of the vessel, refused to comply, and, as the captain of the port delayed giving him the permit to sail, he suspected that the Government was making preparations to seize his passengers, and therefore he sailed without clearance papers. When he put in at La Libertad he was informed that the vessel was declared confiscate, and was forbidden to pull up anchor till the matter was adjusted; otherwise the steamer would be seized by the Government on her arrival at Acajutla. In reply to the inquiries of the company's officials, the Minister of Commerce replied that Salvador was merely putting in force the doctrine laid down by the United States Government in the case of the "Itata." Capt. White was convinced that the Salvadorian President, who was at Acajutla with an armed force, intended to board the steamer and make prisoners of the political refugees. On instructions telegraphed by Mr. Dow, the company's agent at Panama, he ignored the notice of confiscation, weighed anchor on Aug. 10, and landed his passengers safely at San José. The United States minister began his inquiry into the matter after the ship was gone. The incident gave occasion for a protest from the Salvadorian Government, and a demand for the punishment of Capt. White, with which the United States Government refused to comply. After the Salvadorian exiles arrived in the city of Guatemala, attempts were made to assassinate them. Five suspected assassins were expelled from the country by the Guatemala authorities on Sept. 4, after one of the refugees had been shot at; and yet on the same day Dr. Ayala, who was Vice-President of Salvador when President Menendez was killed by the revolutionists, and was therefore the constitutional successor to the office usurped by Ezeta, was murdered in his

own house by a man who stole in and shot him in the back. In November Gen. Maximo Salguero, Dr. Salvador Duarte, and several other persons were arrested in Santa Ana, Salvador, being suspected of a plot to poison Gen. Antonio Ezeta, Vice-President and Minister of War, of Marine, and of the Interior, at the instigation of Dr. Hernandez and Gen. Lissandro Letona, who were still in Guatemala City, and were believed to be actively preparing for a revolution.

SALVATION ARMY. The general income and expenditure account of the Salvation Army for 1891 shows that the expenses of the International Headquarters amounted to £15,964. The sum of £3,639 was spent for divisional centers and corps expenses; £1,095 for "slum work"; and the expenditures on account of public demonstrations and special extension, appeals to the public, the legal department, the sick and wounded fund, and other items, brought the total outlay up to £35,234. The chief items of income were: From gifts and subscriptions, £10,513; quarterly collections from corps throughout the kingdom, £1,285; grants out of trade profits, £13,797; self-denial fund, £5,106; and gifts and subscriptions for sick and wounded fund, including sums from self-denial fund, £3,530. The Colonial and Foreign Service Fund shows a total expenditure of £34,902, of which £9,203 were spent in India, £2,496 in South Africa, £4,423 in Europe, and £444 in South America. The cost of the training-homes had been £5,900. The self-denial fund amounted to £30,281, an increase of £10,000 from the previous year. The profits from the sale of newspapers, periodicals, outfit, and books had amounted to £17,100, of which £13,797, as above, had been handed over to and expended by headquarters. Editions of the "War Cry," the weekly journal of the Army, were published in 35 countries, in 15 languages. The operation, called in the Army "taking prisoners," or the arousing of anxious inquirers, had resulted in the conversion of 100,000 persons at home and 131,000 abroad. The report expresses the opinion that, "considering the vast extent of our operations and the necessarily expensive character of all pioneer work, we are satisfied that the money received from our friends has been laid out to the best advantage."

The International Headquarters staff (including home office, trade department, and social wing) consisted of 1,110 officers. In the British Isles there were 3,587 corps; in France and Switzerland, 445; in Belgium, 41; in Holland, 186; in Germany, 68; in Denmark, 39; in Sweden, 505; in Norway, 231; in Canada and Newfoundland, 1,044; in the United States, 1,293; in the Argentine Republic, 57; in South Africa, 195; in India and Ceylon, 516; in Australia, 1,163; in New Zealand, 268; in Finland, 24; in Italy, 21. Total for 1891, 10,893 corps, showing an increase during the year of 1,015 corps. The weekly newspapers numbered 32, and the monthly magazines 4, all having a total annual circulation of 45,000,000 copies.

SANTO DOMINGO, a republic occupying about two thirds of the island of Hayti. The President is chosen for four years. The Legislature is composed of 22 members, elected by indirect popular suffrage for four years. Gen. Usses

Heureaux was elected President in 1886. The Cabinet was made up in 1891 as follows: Minister of the Interior and of Police, Gen. W. Figueroa; Minister of Foreign Affairs, Gen. J. Gonzalez; Minister of War and Marine, Gen. F. Lithgoro; Minister of Finance and Commerce, Gen. J. F. Sanchez; Minister of Public Works, Gen. A. Wos y Gil.

Area and Population.—The area of the republic is 18,045 square miles. The population in 1888 was 416,871. Santo Domingo, the capital city, has 25,000 inhabitants, and Puerto Plata, the principal seaport, has 15,000. The people are negroes and mulattoes, with some admixture of Indian blood, and a larger sprinkling of whites, descended from Spanish settlers, than is found in the neighboring republic of Hayti. Roman Catholicism is the state religion. There are about 300 schools, with 10,000 pupils.

Finances.—The revenue is obtained mainly from customs duties. In 1889 the budget estimate of revenue was \$1,531,284, and of expenditure \$1,408,543. The debt on Jan. 1, 1889, consisted of an internal debt of \$1,282,592, another internal debt, known as the public debt, amounting to \$1,648,423, a foreign debt of \$234,250, and the debt contracted in London in 1869 which the Council of Foreign Bondholders in 1889 computed at £714,300, with unpaid interest amounting to £664,299. In order to effect a settlement with the old creditors and obtain the sum of £475,000 for public improvements, a new loan of £770,000 has been contracted.

Commerce.—The chief products are tobacco, coffee, cacao, cotton, and sugar. The cultivation of the sugar-cane is extending. To encourage agriculture and immigration the Government offers grants of public lands. The principal exports are logwood, lignum-vitæ, mahogany, coffee, fustic, tobacco, sugar, and cacao. The trade is chiefly with the United States, the Danish West Indies, Spain, England, France, and Germany. The value of the imports in 1887 was \$2,056,928, and that of the exports \$2,660,471. There were 175,637 hundred-weight of tobacco and 9,391 hundred-weight of cacao exported. The export of sugar increased from 114,604 hundred-weight in 1881 to 406,142 hundred-weight in 1887, and that of molasses from 190,802 to 476,933 hundred-weight. In 1888 the total value of imports was \$1,992,884, and that of exports \$2,520,983. According to the United States customs reports, the imports from Santo Domingo into the United States in 1890 were \$1,951,013, the chief articles being sugar for \$1,715,364, hides and skins for \$77,279, dyewoods for \$71,031, and coffee for \$49,443. The domestic exports from the United States to Santo Domingo were valued at \$926,651, the principal items being iron and steel goods, wheat flour, wood manufactures, cotton goods, and lard. The number of ships entered in 1890 was 181, of 97,250 tons.

Communications.—A railroad to unite Sanchez, Samana Bay, and La Vega has been completed for a distance of 72 miles. One has been begun between Puerto Plata and Santiago, and another between Barahona and Cerro de Sal. The post-office in 1889 forwarded 204,546 letters, circulars, etc., in the domestic service, and 182,778 in the international service. There are 369

kilometres in operation, placing Sanchez in communication with La Vega and Puerto Plata with Santo Domingo, and connecting with the French and the South American cables.

Dispute with Hayti.—In 1874, in view of the efforts recently made by the United States Government to acquire Samana Bay as a naval station, the Haytian President induced the Dominican Government to enter into a treaty whereby it pledged itself not to sell, cede, or lease any part of its territory to a foreign power. This agreement was embodied in a treaty of commerce, in which the customs frontier between the two republics was abolished, and each engaged not to levy duties on the products of the other, while an arrangement was made for the equitable division of the maritime customs by which the Haytian Government was to pay over a considerable sum annually to Santo Domingo. For a year or two the payments were made, and then they ceased. An old boundary dispute was revived, and other matters came up to cause friction between the two black republics, whose relations have been in varying degrees strained ever since. The mutual irritation was increased in 1890 when President Hippolyte denounced the treaty of 1874, although it was concluded for twenty-five years, and imposed heavy, almost prohibitive, duties on all Dominican products. A claim of \$823,477, presented by Santo Domingo as the balance due from Hayti which accrued during the first eight years in which the treaty was in force, has been disregarded. A commission was appointed to seek an adjustment of this and other differences; but it broke up without accomplishing its object.

SCHWENKFELDERS. The one hundred and fifty-seventh anniversary of the landing of the first colony of Schwenkfelders in the United States was celebrated at Clayton, Pa., Sept. 24. There are said to be only five organized congregations of this denomination in the United States, all in Pennsylvania, while there are individual members in several other States; but the sect is regarded as declining. The Schwenkfelders originated with Caspar Schwenkfeld, of Silesia, who, in the sixteenth century, educated a Catholic, became a Protestant through reading the works of Tauler and Luther, and took an active part in propagating the doctrines of the Reformation. He afterward advocated doctrines differing from those of Luther on the Eucharist and other subjects, and was persecuted by both Protestants and Catholics. He died at Ulm in 1561, in the seventy-second year of his age. About two thousand members of the Church attended the anniversary at Clayton. The exercises included memorial addresses and a repast, served at noon, according to a traditional custom, in the meeting-house.

SERVIA, a monarchy in southeastern Europe. By the Constitution of Jan. 3, 1889, the executive power is vested in the King, and is exercised in his name by a Council of Ministers, who are individually and collectively responsible to the National Assembly or Skupshtina. Projects of law are first submitted to a Council of State, consisting of 8 members chosen by the vote of the Skupshtina and an equal number nominated by the King. The members of the Skupshtina are elected for three years by the direct suffrage of

all Servians over twenty-one years of age who pay 15 dinars in direct taxes. The reigning King is Alexander I, born Aug. 24, 1876, son of King Milan Obrenovich IV, who abdicated on March 6, 1889, and of Queen Natalie, born in 1859, daughter of Col. Kechko, of the Russian Imperial Guard, from whom King Milan obtained a decree of divorce on Oct. 24, 1888, on the ground of incompatibility, from Archbishop Theodosius, which his successor, Archbishop Michael, declared to be contrary to the Church canons, although afterward he refused to have the divorce formally set aside by the Synod as null and void. During the minority of the King the Government is carried on by a regency consisting of Jovan Ristich, Gen. J. Beli-Marcovich, and Gen. K. S. Protich. The ministry in the beginning of 1891 was composed of the following members: President of the Council and Minister of Foreign Affairs, Gen. Sava Gruich; Minister of Finance, Dr. M. Vuich; Minister of Agriculture and Commerce, K. Tausanovich; Minister of the Interior, J. Djaja; Minister of War *ad interim*, Gen. Gruich; Minister of Public Instruction and Worship, A. Nikolich; Minister of Justice, M. Djordjevich; Minister of Public Works, M. Jossimovich.

Area and Population.—The area of the kingdom is 48,589 square kilometres, or 18,855 square miles. The population in 1891 was estimated at 2,162,759, composed of 1,110,731 males and 1,052,028 females. The mass of the people are of the Servian race and adhere to the Greek Orthodox Church. The number of marriages in 1890 was 21,555; of births, 87,018; of deaths, 54,723; excess of births, 32,295. Belgrade, the capital, had 54,458 inhabitants in 1890.

Finances.—The budget for 1891 makes the total receipts of the Government 56,527,084 dinars or francs, of which 21,214,247 dinars are raised by direct taxation; 3,600,000 dinars are the receipts from customs; 2,077,500 dinars are obtained from the tobacco, spirit, and salt taxes; 2,250,000 dinars are judicial fees; 10,110,000 dinars are the yield of the state monopolies; 3,670,000 dinars are the earnings of domains, posts, telegraphs, etc.; 5,600,000 dinars are derived from the state railroad; 931,954 dinars are the profits of the state mortgage bank; and 7,673,383 dinars come from various other sources. The total expenditures were estimated at 59,525,894 dinars, of which 19,900,880 dinars represent the expenses of the debt, 1,200,000 dinars the civil list, 1,998,806 dinars pensions and dotations, 3,652,384 dinars the expenditure of the Ministry of Education, 4,947,755 dinars those of the Ministry of Finance, 2,642,037 dinars those of the Ministry of the Interior, 1,183,313 dinars those of the Ministry of Foreign Affairs, 9,739,113 dinars those of the Ministry of War, 4,202,541 dinars those of the Ministry of Public Works, 3,664,527 dinars those of the Ministry of Agriculture and Commerce, 1,181,593 dinars those of the Ministry of Justice, 313,155 dinars the cost of the Legislature and State Council, 373,226 dinars general expenses of Government, and 3,823,564 dinars miscellaneous expenditures.

The debt on Jan. 1, 1891, amounted to the capital sum of 330,510,734 dinars, viz., railroad loans amounting to 152,353,000 dinars, a Russian debt of 3,704,734 dinars, a loan of 6,732,500 dinars raised to indemnify emigrating land-owners, a

lottery loan of 32,135,000 dinars, a loan of 39,774,000 dinars raised in June, 1884, one of 38,906,500 dinars raised in October, 1885, and subsequent loans of 6,000,000 dinars for which the salt revenue is pledged, 9,928,000 dinars borrowed on the security of the tobacco monopoly, and 40,977,000 dinars on the other monopolies.

The Army.—The Radical party, when it was placed in power by the votes of the rural population in 1889, promised to abolish the standing army and establish a militia system. No steps have been taken to carry out this pledge. The law of Jan. 31, 1889, makes service obligatory. It begins at the age of twenty-one and lasts one year in the active army, nine years in the reserve, and ten years in each of the two bans of the national militia. In case of mobilization the active army and its reserve are expected to furnish 5 divisions, each comprising 3 regiments of 4 battalions of infantry, 1 battalion of foot guards, 1 regiment of artillery divided into 2 sections of 4 batteries each, and 1 company of engineers, besides the commissary, train, ambulance and hospital services, etc. Outside of the division formations there are 3 regiments of cavalry, 1 battery of mounted artillery, 9 mountain batteries, engineers, sappers, railroad and telegraph troops, siege and fortress artillery, etc. The first ban of the militia ought to furnish in time of war 15 regiments of infantry, 5 regiments of artillery, 5 sections of cavalry, and its complement of auxiliary troops, and the second ban should consist of about 60 battalions of infantry. The approximate strength of the active army and its reserve is estimated at 70,000 infantry, 3,500 cavalry, 7,000 artillery, and 3,500 engineers, etc., making 84,000 men, without counting train and non-combatants. The strength of the militia, exclusive of auxiliary services, is 70,000 infantry, 1,000 cavalry, 2,000 artillery, and 500 engineers, or in all 73,500 fighting men.

Commerce.—The farmers of Servia own the land they cultivate. More than half the area of the kingdom is under grain or vines. Large quantities of prunes are grown, the product in 1888 having amounted to 25,000 tons and the export to 16,942 tons. Pigs are raised in great number for export and fattened on acorns, which are very abundant. The imports in 1890 were valued at 38,045,000 dinars, of which 22,820,000 dinars came from Austria-Hungary, 4,888,000 dinars from Great Britain, 2,868,000 dinars from Germany, 1,622,000 dinars from America, and the rest from Bulgaria, Turkey, Russia, Roumania, Switzerland, and other countries. The total value of the exports was 45,841,000 dinars, of which 39,398,000 dinars went to Austria-Hungary, 3,138,000 dinars to Turkey, and the next largest amount, viz., 811,000 dinars, to Germany. Of the imports, 4,119,000 dinars consisted of colonial goods, 7,649,000 dinars of cotton manufactures, 2,715,000 dinars of woolens, and 3,448,000 dinars of metals. In the total value of exports 18,000,000 dinars represent the exports of field and orchard produce, and an equal sum those of live animals and animal products.

Communications.—The principal railroad, running from Belgrade to Vranja, has a length of 367 kilometres, and the three branches make the total length 540 kilometres. The telegraph lines in 1889 had a length of 2,912 kilometres,

with 4,930 kilometres of wires. The dispatches sent during the year numbered 496,088, of which 340,062 were paid internal and 139,973 international, 13,673 were transit dispatches, and 2,380 were connected with the service. In 1889 the post-office forwarded 4,021,000 domestic and 2,935,000 international letters.

Expulsion of Queen Natalie.—In January, 1891, M. Ristich renewed the offer made in the name of the regency and the Cabinet in July, 1889, by Col. Gruich, which was that the Queen should reside abroad, but that she should pay two or three visits annually to her son as his guest in the palace, and when in Belgrade should be treated with royal honors. This compromise, though it virtually recognized the invalidity of her divorce, was not satisfactory to her, and was still less acceptable to King Milan; who entered a strong protest. M. Ristich, in a letter replying to Natalie's complaints, accused her of unscrupulous ambition and of conduct toward her husband such as a daughter of M. Kechko ought not to have followed toward an Obrenovich who had raised her to the Servian throne. An agitation against the Queen was started among the Radicals, who represented her as striving to usurp the Government. She returned M. Ristich's letter, and wrote that her self-respect would not allow her to hold any further relations with the regency or the Government. In the course of the controversy King Milan, who was alleged to have accepted 100,000 francs as the price of his leaving Belgrade, accused Milutin Garashanin of having had Helena Markovich, who shot at the King on Oct. 23, 1892, and her accomplice, Helena Knicanin, both secretly murdered in prison to conceal his own connection with their crime. Garashanin, who continued to be Milan's Prime Minister for five years after the mysterious death of the two women, confirmed the statement that they were assassinated, but sought to fasten the guilt upon the ex-King. The mutual calumniations interchanged by the chief actors of the last reign led the Skupshtina to amend the press laws by making attacks on King Milan or any member of the royal family, or upon the Regents, punishable with imprisonment, adding an amendment making criticisms of acts of the Legislature equally punishable. On March 22 the chief regent and the Prime Minister submitted to King Milan a draft agreement providing that both he and Queen Natalie should reside abroad till King Alexander's majority, and should each receive a month's visit annually from their son, whom, in case he should fall dangerously ill, the King should be permitted to visit in Belgrade; that King Milan should be paid an allowance of 30,000 francs a month; and that the question of the legality of the divorce should be adjudicated by the Consistory of the Servian Synod. An arrangement was arrived at with Milan, who, on the receipt of 1,000,000 francs in cash and the promise of a pension of 300,000 francs a year, left Servia in the middle of April and agreed to remain away till Aug. 1, 1894, when the young King attains his majority, making it a condition that the Queen should also be kept out of the country. At the last sitting of the Skupshtina a resolution was passed after a stormy debate expressing the hope that the Government would

use measures to induce Queen Natalie to leave the country. Her friends of the Progressist party, including M. Garashanin and Gen. Horvatovich, advised her to yield only to force. On May 8 M. Pachich gave her official notice of the resolution of the Skupshtina. She expressed her determination to stand on her constitutional right to remain, not for the purpose of meddling in politics, but to prove to her son that she had not left him of her own free will. On May 18 the Government made an attempt to expel her by force. A company of gendarmes surrounded her house, and the prefect of police carried her off in a carriage; but on the way to the wharf where the royal yacht was waiting to take her on board, university students stopped the carriage, detached the horses, and dragged it back in triumph to the Queen's residence. Respectable citizens and students who volunteered to defend the house were fired on by soldiers, who killed two and wounded several. The whole garrison was called out, and the streets were the scene of severe fighting, in which many casualties occurred among both citizens and soldiers. The fighting ceased, and the Queen's defenders dispersed only after a promise had been given that the decree of expulsion would be withdrawn. The way having been cleared by this falsehood, at daybreak the Queen was conveyed by force to a railroad train and escorted to Semlin, in Hungary, after protesting against the illegality of the proceeding; for the Constitution and laws of Servia provide no power of banishment, even by judicial decree and for criminal offenses, and recently the Skupshtina had refused to pass a bill to supply the omission. The object of the Radical party and the Government in expelling Queen Natalie was not so much to prevent her from making trouble by her political activity, for her immediate followers were few and powerless, but to insure the absence of King Milan. All the Opposition newspapers were confiscated, a great number of the Queen's friends were arrested, and the garrison at Belgrade was strengthened as a precaution against an uprising of citizens. Col. Miletich, the Minister of War, disapproving the intended action of the Cabinet, offered his resignation on May 15, which was not accepted by the regents at first, but when he declined to make the desired military dispositions he was replaced provisionally by Col. Jankovich, chief of the General Staff. On May 19 Col. Z. D. Praporchetovich was appointed Minister of War.

The expulsion of the Queen was condemned by a part of the Radical party as a violation of the Constitution, and a larger number blamed the ministers for the brutal and unskillful manner in which her removal was effected. On May 24, M. Djaia, the Minister of the Interior, offered his resignation, which he was induced a day or two afterward to withdraw. The prefect of police and commander of the gendarmerie were superseded. Much as the ministry and the regency were discredited, the Queen-mother was in a worse position than ever. If she had accepted the proposal made to her at Wiesbaden in June, 1888, her son would have been permitted to reside with her for nine months in the year. After the divorce proceedings were instituted she intimated her willingness to accept these terms,

W. T. Sherman

but it was too late. The proposition that she might come to Serbia twice a year and be received with royal honors she also seemed disposed to accept after first refusing. After coming to Serbia in 1889 she took a course that was fatal to her own objects and dangerous to the dynasty, by addressing a memorandum to the Skupshtina attacking the regency, the Government, and the metropolitan, thus attempting to make political capital for the Progressist Opposition, and deliberately placing herself at the head of a political faction. Her action brought King Milan to Serbia, and the regents and ministers saw no way to avoid civil disturbances except by getting them both out of the country; for if Milan should feel impelled to reassume the royal power, he would receive the support of a large part of the army, and by his political dexterity could enlist in his cause a party of considerable strength, and could draw to his support a part of the Radical party, which fought strenuously for years against his absolute rule that the Progressists, now his bitterest enemies, upheld, and organized rebellions against him when he was king. M. Ristich and the Archbishop Michael, once the Queen's staunchest friends, were now her implacable foes; and the Liberal party, though it had turned against the first regent, whose guidance it formerly followed obediently, withheld the support that the Queen expected. The violent demonstrations in Belgrade originated not so much in partisanship for her as in hostility to the Government, which had made itself thoroughly unpopular by imposing the *octroi* duties. The Queen vainly sought to obtain the interposition of the Russian Government, and after the departure of the royal pair affairs in Serbia quieted down. In August the young King went to Russia to pay a visit to the Czár, accompanied by M. Ristich and M. Pachich. On his return he visited the Austrian Emperor at Ischl, and then went to Paris to pass some weeks with his father.

Change of Cabinet.—Dissensions in the Radical Club led to the resignation of M. Gruich on Feb. 20, 1891, and the formation of a Cabinet by M. Pachich, the president of the Skupshtina and leader of the moderate faction of the Radical party. Most of the ministers retained their portfolios, and the Cabinet was constituted on Feb. 23 as follows: Minister-President, without portfolio, N. Pachich; Minister of Public Works, P. Velimirovich; Minister of Finance, Dr. M. Vuich; Minister of Justice, G. Gershich; Minister of Agriculture and Commerce, K. Taushanovich; Minister of Foreign Affairs, M. Djordjevich; Minister of the Interior, J. Djaia; Minister of Public Worship, A. Nikolich; Minister of War, Col. Miletich. The ultimate aims of the section of the party which asserted its influence in the overthrow of M. Gruich embraced the abolition of the standing army, the reduction of expenditures by 20,000,000 francs, the adoption of a bold Great Servian foreign policy, and the restoration of the Karageorgevich dynasty. The most important measure of the Skupshtina, which ended its sittings in the middle of April, was a bill to impose *octroi* duties in order to raise on the security of the new tax a loan of 10,000,000 dinars or francs for paving, draining, and lighting Belgrade. The Austrian Government had negotiated with for a year and a half, but had

refused to assent to the measure, and when the bill was passed, although the duties were only half as much as had been contemplated, it announced that if they were collected on Austrian goods the existing commercial treaty would be regarded as null and void. The German and British governments joined in the protest. Nevertheless the Servian Government promulgated the bill, giving out that it was constrained to levy the new duties to meet the interest on the public debt, most of which was held abroad. The Government had to meet a deficit of 12,000,000 dinars, and among the measures adopted in the emergency was one reducing by 8 per cent. the salaries of all state officials, which were already very low. In addition to the Cabinet difficulties that occurred during the progress of the affair of Queen Natalie, the Minister of Worship and Instruction engaged in a conflict with the metropolitan, who refused to confirm the appointment of an active Radical politician as vicar of Belgrade. In August the Finance Minister, Dr. Vuich, could not obtain the consent of his colleagues to the summary collection of arrears of taxes, amounting to 19,000,000 dinars, and as without these he saw no way of averting a deficit, he resigned on the return, in September, of the Prime Minister, who himself took charge of the department *ad interim*.

SHERMAN, WILLIAM TECUMSEH, an American soldier, born in Lancaster, Ohio, Feb. 8, 1820; died in New York city, Feb. 14, 1891. He was a descendant of the Rev. John Sherman, of Essex, England, who emigrated to America in 1634 and settled in Woodbury, Conn. A brother of the Rev. John Sherman, who emigrated at the same time, was an ancestor of Roger Sherman. Some of the family removed to Lancaster, Ohio, early in this century, and Gen. Sherman's father was a justice of the Supreme Court of that State from 1824 till his death in 1829. The General's mother was Mary Hoyt, and he was the sixth of eleven children. After his father's death he was adopted by the Hon. Thomas Ewing, United States Senator, who a few years later appointed him a cadet in the Military Academy at West Point. There he was graduated in 1840, standing No. 6 in a class of 42. Among his classmates were Gens. George H. Thomas and George W. Getty, of the National, and Gens. Richard S. Ewell, Bushrod Johnson, and Thomas Jordan, of the Confederate service. He was commissioned second lieutenant in the Third Artillery, July 1, 1840, and ordered to Florida, where the Seminoles were still hostile. He became first lieutenant Nov. 30, 1841, and in 1842 was ordered to Fort Morgan, Ala. In 1843-46 he was at Fort Moultrie, Charleston harbor, and at Bellefontaine, Ala., and in 1846 was on recruiting service at Pittsburg, Pa.

On the breaking out of the war with Mexico he was assigned to Company F, Third Artillery, as junior first lieutenant, when the company was ordered to California. They sailed from New York, July 14, 1846, in the United States store-ship "Lexington," commanded by Theodorus Bailey, afterward famous as one of Farragut's ablest lieutenants. Among the officers with Sherman were Lieuts. E. O. C. Ord and Henry W. Halleck, afterward generals. They made the passage round Cape Horn, calling at Rio de

Janeiro and Valparaiso, and anchored in the Bay of Monterey, California, Jan. 26, 1847. In California Sherman was adjutant-general to Gen. Stephen W. Kearny, Col. R. B. Mason, and Gen. Persifer F. Smith, successively. He had many adventures of the kind incident to a new and unsettled country. In July, 1847, Yerba Buena (now San Francisco) had been laid out in lots, which were offered for sale at \$16 apiece. Sherman says: "Many naval officers had invested, and Capt. Folsom advised me to buy some; but I felt actually insulted that he should think me such a fool as to pay money for property in such a horrid place as Yerba Buena, especially ridiculing his quarter of the city, then called Happy Valley." Another incident was much more significant. Sherman tells it in his "Memoirs":

I remember one day, in the spring of 1848, that two men, Americans, came into the office and inquired for the Governor. I asked their business, and one answered that they had just come down from Capt. Sutter on special business, and they wanted to see Gov. Mason *in person*. I took them in to the colonel, and left them together. After some time the colonel came to his door and called to me. I went in, and my attention was directed to a series of papers unfolded on his table, in which lay about half an ounce of *placer-gold*. Mason said to me, "What is that?" I touched it and examined one or two of the larger pieces, and asked, "Is it gold?" Mason asked me if I had ever seen native gold. I answered that in 1844 I was in upper Georgia, and there saw some native gold, but it was much finer than this, and that it was in vials, or in transparent quills; but I said that, if this were gold, it could easily be tested, first by its malleability, and next by acids. I took a piece in my teeth, and the metallic luster was perfect. I then called to the clerk, Baden, to bring an axe and hatchet from the back yard. When these were brought, I took the largest piece and beat it out flat, and beyond doubt it was metal, and a pure metal. Still, we attached little importance to the fact, for gold was known to exist at San Fernando, at the south, and yet was not considered of much value.

Sherman twice visited the newly discovered gold mines on the Sacramento and became partner in a store, from which he made a profit of \$1,500, without which he says he could not have lived, as his official salary remained fixed, while the gold excitement enormously increased the price of everything. He also surveyed one of the many new cities that were laid out on the shores of San Francisco Bay, engaged in other surveys, and made some profitable investments in land.

In January, 1850, Sherman returned from California as a bearer of dispatches to the War Department, and on May 1 he married, in Washington, Ellen Ewing, daughter of Hon. Thomas Ewing, then Secretary of the Interior. In September he was commissioned captain and ordered to St. Louis. Two years later he was ordered to New Orleans. But he had hardly assumed his duties there when he was offered a partnership in a branch banking house which a St. Louis firm proposed to establish in San Francisco. In February, 1853, having obtained six months' leave of absence, he took passage for California by the Nicaragua route. The passage from the Isthmus was made in the steamer "S. S. Lewis," which got out of her course in a fog and was wrecked near shore 18 miles north of San Francisco, April 9. Capt. Sherman made

his way to the city and had a relief vessel sent to the shipwrecked crew and passengers. When he had examined into the proposed business, he returned home in the summer, resigned his commission in the army, and on Sept. 20 sailed from New York with his family, reaching San Francisco on Oct. 15. In the spring of 1856 Sherman was commissioned major-general of militia, and a little later occurred the Vigilance Committee troubles. Gen. Sherman enrolled men in the militia and proposed to suppress the Vigilantes; but when Gen. Wool, commanding United States forces in that department, refused to furnish arms, Sherman at once resigned his commission. With the decline of prosperity in San Francisco his firm closed up their business, and on May 1, 1857, he sailed for New York, where, on July 21, with the same partners, he began a banking business. But in the financial crisis of the following autumn they again closed up their business, paying all liabilities, and dissolved the partnership. After another trip to California to make final settlements and dispose of the firm's real estate, Gen. Sherman, in the autumn of 1858, entered into a law partnership with Hugh Ewing and Thomas Ewing, Jr., in Leavenworth, Kansas. In January, 1859, Daniel McCook (afterward General, killed in the Atlanta campaign) was taken in as a partner. They did a fair business, but it was hardly enough to support them as they wished, and Sherman spent a part of his time in opening a large farm for his father-in-law, and meanwhile wrote to Major (afterward General) Don Carlos Buell, in the War Department, inquiring if there was not a vacant paymastership. Buell informed him that a military college was about to be organized in Louisiana, and advised him to apply for the superintendency. Sherman took the advice, and in July, 1859, was appointed. The institution was established at Alexandria, and on Jan. 1, 1860, Gen. Sherman opened it with a faculty of five professors (he being Superintendent and Professor of Engineering) and 60 cadets. Of the condition of political affairs, as affecting him, in the autumn of that year, Sherman says:

Political excitement was at its very height, and it was constantly asserted that Mr. Lincoln's election would imperil the Union. I purposely kept aloof from politics, would take no part, and remember that on the day of the election in November I was notified that it would be advisable for me to vote for Bell and Everett; but I openly said I would not, and I did not. The election of Mr. Lincoln fell upon us all like a clap of thunder. People saw and felt that the South had threatened so long that, if she quietly submitted, the question of slavery in the Territories was at an end forever. I mingled freely with the members of the Board of Supervisors, and with the people of Rapides Parish generally, keeping aloof from all cliques and parties, and I certainly hoped that the threatened storm would blow over, as had so often occurred before after similar threats. At our semi-annual order of exercises went along with the regularity of the seasons. Once a week I had the older cadets to practice reading, reciting, and elocution, and noticed that their selections were from Calhoun, Yancey, and other Southern speakers, all treating of the defense of their slaves and their home institutions as the very highest duty of the patriot. Among boys this was to be expected; and among the members of our board, though most of them declaimed against politicians generally, and especially abolitionists, as pests, yet there was a growing feeling that danger was

in the wind. I recall the visit of a young gentleman who had been sent from Jackson by the Governor of Mississippi to confer with Governor Moore, then on his plantation at Bayou Robert, and who had come over to see our college. He spoke to me openly of secession as a fixed fact, and that its details were only left open for discussion. I also recall the visit of some man who was said to be a high officer in the order of "Knights of the Golden Circle," of the existence of which order I was even ignorant until explained to me by Major Smith and Dr. Clark. But in November, 1860, no man ever approached me offensively to ascertain my views or my proposed course of action in case of secession, and no man in or out of authority ever tried to induce me to take part in steps designed to lead toward disunion. I think my general opinions were well known and understood, viz., that "secession was treason, was war"; and that in no event could the North and West permit the Mississippi river to pass out of their control.

On Jan. 18, 1861, Sherman wrote a letter to Gov. Moore, of Louisiana, in which he said:

As I occupy a *quasi*-military position under the laws of the State, I deem it proper to acquaint you that I accepted such position when Louisiana was a State in the Union, and when the motto of this seminary was inserted in marble over the main door: "By the liberality of the General Government of the United States. The Union—*est perpetua*." Recent events foreshadow a great change, and it becomes all men to choose. If Louisiana withdraw from the Federal Union, I prefer to maintain my allegiance to the Constitution as long as a fragment of it survives, and my longer stay here would be wrong in every sense of the word. In that event, I beg you will send or appoint some authorized agent to take charge of the arms and munitions of war belonging to the State, or advise me what disposition to make of them. And furthermore, as President of the Board of Supervisors, I beg you to take immediate steps to relieve me as superintendent the moment the State determines to secede, for on no earthly account will I do any act or think any thought hostile to or in defiance of the old Government of the United States.

In February he severed his connections with the institution, and on parting with him its Board of Supervisors adopted this resolution:

Resolved, That the thanks of the Board of Supervisors are due, and are hereby tendered, to Col. William T. Sherman for the able and efficient manner in which he has conducted the affairs of the seminary during the time the institution has been under his control—a period attended with unusual difficulties, requiring on the part of the superintendent to successfully overcome them a high order of administrative talent. And the board further bear willing testimony to the valuable services that Col. Sherman has rendered them in their efforts to establish an institution of learning in accordance with the beneficent design of the State and Federal governments; evincing at all times a readiness to adapt himself to the ever-varying requirements of an institution of learning in its infancy, struggling to attain a position of honor and usefulness.

About the 1st of March Sherman returned to Ohio. At the same time he was offered the superintendency of the Fifth Street Railroad, in St. Louis, and on April 1 he assumed the duties of the office. On May 14 he was appointed colonel of the Thirtieth United States Infantry, whereupon he resigned his place in St. Louis and reported at the War Department in Washington. He says in his "Memoirs":

The appearance of the troops about Washington was good, but it was manifest they were far from being soldiers. Their uniforms were as various as the

States and cities from which they came, their arms were also of every pattern and caliber, and they were so loaded down with overcoats, haversacks, knapsacks, tents, and baggage, that it took from 2 to 300 wagons to move the camp of a regiment from one place to another, and some of the camps had bakeries and cooking establishments that would have done credit to Delmonico.

The temper of Congress and the people would not permit the slow and methodical preparation desired by Gen. Scott; and the cry of "On to Richmond!" which was shared by the volunteers, most of whom had only engaged for ninety days, forced Gen. Scott to hasten his preparations, and to order a general advance about the middle of July. McDowell was to move from the defenses of Washington, and Patterson from Martinsburg.

Sherman was assigned to the command of the Third Brigade in the First Division (Tyler's) of McDowell's army. His brigade was made up of the Thirteenth, Sixty-ninth, and Seventy-ninth New York and the Second Wisconsin Regiments, and Ayres's battery was attached to it. The march to Manassas, he says, "demonstrated little save the general laxity of discipline, for with all my personal efforts I could not prevent the men from straggling for water, blackberries, or anything on the way they fancied."

At Blackburn's Ford, on July 18, the advance of Sherman's brigade developed the presence of the enemy on the other side of Bull Run. In the action of the 21st—known as the battle of Bull Run, or Manassas—Sherman led his brigade with skill, suffering a loss of 600 in killed, wounded, and missing. He appears to think that the famous panic originated among his men, for in his official report he says: "Here," (on a ridge where one of his regiments was engaged), "about half-past 3 p. m., began the scene of confusion and disorder that characterized the remainder of the day." After the retreat he set himself to the task of restoring discipline to his command, and preparing the defensive works for the Confederate attack that was daily expected. Shortly afterward he was commissioned brigadier-general of volunteers.

On Aug. 24 he was assigned to the Department of the Cumberland, the command of which was given to Gen. Robert Anderson, with whom Sherman had served nearly twenty years before at Fort Moultrie. His anxiety was that a proper force should be sent into Kentucky. All the troops that were being organized and equipped so rapidly were sent either to McClellan at the East or to Frémont in Missouri, and he was sent on a fruitless errand to Indianapolis and St. Louis to get forces to meet the expected invasion of Kentucky. On Oct. 8 Gen. Anderson, from failing health, relinquished his command of the department, and Sherman succeeded to it. In an interview with the Secretary of War, who was passing through Louisville, Gen. Sherman urged the importance of the line in Kentucky, and argued that, for a proper defense of it, he should have 60,000 men at once, and that for offensive operations 200,000 would be needed before the end. This was laughed at, and by some he was supposed to be slightly insane.

In November he was relieved by Gen. P. G. B. and transferred to the Department of the West, then commanded by Gen. Halleck. During the winter Sherman commanded a camp of

instruction near St. Louis, and on Feb. 13 he was ordered to assume command of the post at Paducah. Here, from new troops arriving, he organized a division for himself, and on March 10 embarked it on transports and moved up the Tennessee. With this division, on April 6 and 7, he participated in the bloody battle of Shiloh, or Pittsburg Landing, holding the right of the line, near Shiloh church. His command included 12 regiments and 4 batteries, and his total loss in killed, wounded, and missing was 2,034. He lost 7 guns on the 6th, and captured 7 on the 7th. Soon after this action he was promoted to major-general of volunteers. In the advance on Corinth in May, Sherman commanded on the extreme right. When the enemy abandoned Corinth, Halleck's army was broken up, and Sherman's division was employed in repairing the railroads. In July Halleck was called to Washington as military adviser to the President, and thenceforth Sherman was under the immediate command of Grant. His headquarters were now at Memphis.

A letter written by Sherman at this time to his brother is interesting as showing how the state of affairs appeared to him. The following is an extract:

For six weeks I was marching along the road from Corinth to Memphis, mending roads, building bridges, and all sorts of work. At last I got here, and found the city contributing gold, arms, powder, salt, and everything the enemy wanted. It was a smart trick on their part thus to give up Memphis, that the desire of gain to our Northern merchants should supply them with the things needed in war. I stopped this at once, and declared gold, silver, treasury notes, and salt as much contraband of war as powder. I have one man under sentence of death for smuggling arms across the lines, and hope Mr. Lincoln will approve it. But the mercenary spirit of our people is too much, and my orders are reversed, and I am ordered to encourage the trade in cotton, and all orders prohibiting gold and silver to be paid for it are annulled by orders from Washington. Grant promptly ratified my order, and all military men here saw at once that gold spent for cotton went to the purchase of arms and munitions of war. But what are the lives of our soldiers to the profits of the merchants? After a whole year of bungling the country has at last discovered that we want more men. All knew it last fall as now, but it was not popular. Now, 1,300,000 men are required when 700,000 were deemed absurd before. We should be in Jackson, Meriden, and Vicksburg. Still I must not growl. I have purposely kept back and have no right to criticize, save that I am glad that papers have at last found out we are at war and have a formidable enemy to combat. Of course I approve the confiscation act, and ought to be willing that the Government should amend that article of the Constitution which forbids the forfeiture of land to the heirs. My full belief, is we must colonize the country *de novo*, beginning with Kentucky and Tennessee, and should remove 4,000,000 of our people at once south of the Ohio river, taking the farms and plantations of the rebels. I deplore the war as much as ever, but if the thing has to be done, let the means be adequate. Don't expect to win such a country or subdue such a people in one, two, or five years—it is the task of half a century. Although our army is thus far south, I can not stir from our garrisons. Our men are killed or captured within sight of our lines. . . . To attempt to hold all the South would demand an army too large even to think of. We must colonize and settle as we go South, for in Missouri there is as much strife as ever. Enemies must be killed, or transported to some other country.

In December, in co-operation with a plan of Grant's to attack the Confederate army commanded by Gen. Pemberton on the Tallahatchie, Sherman moved down the eastern bank of the Mississippi, accompanied by Porter's fleet of gunboats, to attack Vicksburg in the rear. But unexpected natural obstacles were met, and the sudden capture of Grant's depot of supplies at Holly Springs thwarted the undertaking. Sherman vainly attacked the defenses on the north side of the city and lost 1,800 men.

In January, 1863, Gen. McClelland assumed command of the two corps commanded by Gens. Sherman and George W. Morgan, and at Sherman's suggestion the whole force ascended Arkansas river 100 miles to attack Fort Hindman or Arkansas Post. They landed on the 10th, and the next day, assisted by the fire of the gunboats, assaulted the work and captured it with its garrison of nearly 5,000 men. The loss to the national force was about 1,000. The fort was dismantled and its stores taken on board the boats, and the expedition returned. Grant now took command in person of the movement on the Mississippi and divided his army into four corps, of which Sherman commanded one, the Fifteenth. In the operations that resulted in the siege and capture of Vicksburg Sherman's corps bore a conspicuous part, and he was made a brigadier-general in the regular army, to date from July 4, 1863, the day the city was surrendered.

Soon after the fall of Vicksburg Gen. Halleck addressed a letter to Gen. Sherman, saying that "the question of reconstruction in Louisiana, Mississippi, and Arkansas will soon come up for decision of the Government, and not only the length of the war but our ultimate and complete success will depend upon its decision," and intimating that the President would like the views of generals in the field. In answer, Sherman wrote a long letter, from which the following significant and characteristic passages are taken:

I would deem it very unwise at this time, or for years to come, to revive the State governments of Louisiana, etc., or to institute in this quarter any civil government in which the local people have much to say. They had a government so mild and paternal that they gradually forgot they had any at all save what they themselves controlled; they asserted an absolute right to seize public moneys, forts, arms, and even to shut up the natural avenues of travel and commerce. They chose *war*; they ignored and denied all the obligations of the solemn contract of government, and appealed to force. We accepted the issue, and now they begin to realize that war is a two-edged sword, and it may be that many of the inhabitants cry for *peace*. I know them well, and the very impulses of their nature; and to deal with the inhabitants of that part of the South which borders on the great river, we must recognize the classes into which they have divided themselves:

First. The large planters, owning lands, slaves, and all kinds of personal property. These are, on the whole, the ruling class. They are educated, wealthy, and easily approached. In some districts they are bitter as gall, and have given up slaves, plantations, and all, serving in the armies of the Confederacy; whereas, in others, they are conservative. None dare admit a friendship for us, though they say freely that they were at the outset opposed to war and disunion. I know we can manage this class, but only by *action*. Argument is exhausted, and words have lost their

usual meaning. Nothing but the logic of events touches their understanding; but, of late, this has worked a wonderful change.

Second. The smaller farmers, mechanics, merchants, and laborers. This class will probably number three-quarters of the whole; have, in fact, no real interest in the establishment of a Southern Confederacy, and have been led or driven into war on the false theory that they were to be benefited somehow—they knew not how. They are essentially tired of the war, and would slink back home if they could. These are the real *tiers état* of the South, and are hardly worthy a thought; for they swerve to and fro according to events which they do not comprehend or attempt to shape. When the time for reconstruction comes they will want the old political system of caucuses, legislatures, etc., to amuse them and make them believe they are real sovereigns; but in all things they will follow blindly the lead of the planters.

Third. The Union men of the South. I must confess I have little respect for this class. They allowed a clamorous set of demagogues to muzzle and drive them as a pack of curs. Afraid of shadows, they submit tamely to squads of dragoons, and permit them, without a murmur to burn their cotton, take their horses, corn, and everything; and when we reach them, they are full of complaints if our men take a few fence-rails for fire, or corn to feed our horses. They give us no assistance or information, and are loudest in their complaints at the smallest excesses of our soldiers. Their sons, horses, arms, and everything useful, are in the army against us, and they stay at home, claiming all the exemptions of peaceful citizens. I account them as nothing in this great game of war.

Fourth. The young bloods of the South. Sons of planters, lawyers about towns, good billiard players, and sportsmen, men who never did work and never will. War suits them, and the rascals are brave, fine riders, bold to rashness, and dangerous subjects in every sense. They care not a sou for niggers, land, or anything. They hate Yankees *per se*, and don't bother their brains about the past, present, or future. As long as they have good horses, plenty of forage, and an open country, they are happy. This is a larger class than most men suppose, and they are the most dangerous set of men that this war has turned loose upon the world. They are splendid riders, first-rate shots, and utterly reckless. Stewart, John Morgan, Forrest, and Jackson, are the types and leaders of this class. These men must all be killed or employed by us before we can hope for peace. They have no property or future, and therefore can not be influenced by anything except personal considerations.

The people of all this region are represented in the Army of Virginia, at Charleston, Mobile, and Chattanooga. They have sons and relations in each of the rebel armies, and naturally are interested in their fate. Though we hold military possession of the key-points of their country, still they contend, and naturally, that should Lee succeed in Virginia, or Bragg at Chattanooga, a change will occur here also. We can not for this reason attempt to reconstruct parts of the South as we conquer it, till all idea of the establishment of a Southern Confederacy is abandoned.

It seems to me, in contemplating the history of the past two years, that all the people of our country, North, South, East, and West, have been undergoing a salutary political schooling, learning lessons which might have been acquired from the experience of other people; but we had all become so wise in our own conceit that we would only learn by actual experience of our own.

Another great and important natural truth is still in contest, and can only be solved by war. Numerical majorities by vote have been our great arbiter. Heretofore all men have cheerfully submitted to it in questions left open, but numerical majorities are not necessarily physical majorities. The South, though numerically inferior, contend they can whip the

Northern superiority of numbers, and therefore by natural law they contend that they are not bound to submit. This issue is the only real one, and in my judgment all else should be deferred to it. War alone can decide it, and it is the only question now left for us as a people to decide. Can we whip the South? If we can, our numerical majority has both the natural and constitutional right to govern them. If we can not whip them, they contend for the natural right to select their own government, and they have the argument. Our armies must prevail over theirs; our officers, marshals, and courts must penetrate into the innermost recesses of their land, before we have the natural right to demand their submission.

I would banish all minor questions, assert the broad doctrine that as a nation the United States has the right, and also the physical power, to penetrate to every part of our national domain, and that we will do it—that we will do it in our own time and in our own way; that it makes no difference whether it be one year, or two, or ten, or twenty; that we will remove and destroy every obstacle, if need be, take every life, every acre of land, every particle of property, everything that to us seems proper; that we will not cease till the end is attained; that all who do not aid us are enemies, and that we will not account to them for our acts. If the people of the South oppose, they do so at their peril; and if they stand by, mere lookers-on in this domestic tragedy, they have no right to immunity, protection, or share in the final results.

The issues are made, and all discussion is out of place and ridiculous. The section of thirty-pounder Parrott rifles now drilling before my tent is a more convincing argument than the largest Democratic meeting the State of New York can possibly assemble at Albany; and a simple order of the War Department to draft enough men to fill our skeleton regiments would be more convincing as to our national perpetuity than an humble pardon to Jeff. Davis and all his misled host.

I therefore hope the Government of the United States will continue, as heretofore, to collect in well-organized armies the physical strength of the nation; applying it, as heretofore, in asserting the national authority; and in persevering, without relaxation, to the end. This, whether near or far off, is not for us to say; but, fortunately, we have no choice. We must succeed—no other choice is left us except degradation. The South must be ruled by us, or she will rule us. We must conquer them, or ourselves be conquered.

President Lincoln read this letter carefully, and asked permission to have it published, but Sherman declined, and it did not appear in print till ten years after the war.

After the Mississippi had been cleared by the capture of Vicksburg and Port Hudson, the army was kept in comparative idleness for some months. Sherman's corps was encamped on the western bank of the Big Black river. After the battle of Chickamauga in September, which drove Rosecrans's army back to Chattanooga, Sherman was ordered to move eastward along the Memphis and Charleston Railroad, repairing it as he went. On Oct. 16 Gen. Grant was ordered to assume command of the departments of the Ohio, the Cumberland, and the Tennessee, to relieve Gen. Rosecrans at Chattanooga, and to make such changes in the subordinate commands as seemed necessary. Gen. Sherman was made commander of the Department and Army of the Tennessee.

On the 27th Sherman received orders from Grant to suspend work on the railroad and cross the country with his army as soon as possible to Bridgeport, below Chattanooga, which place he reached, by rapid marching, in the middle of

November. In Grant's dispositions for raising the siege of Chattanooga by driving the army of Bragg from its position on Lookout mountain and Missionary Ridge overlooking the town, Sherman's command was placed on the left, opposite the head of Missionary Ridge. Thomas was in the center and Hooker on the right. Sherman laid two bridges in the night of Nov. 23, and the next day advanced against the Confederate works, but the ground was very difficult, and he was only partially successful. Hooker and Thomas were completely so, and the enemy was routed. The task of Hooker and Thomas was lightened by the enemy's attacking Sherman heavily, hoping to crush him. After the battle he advanced promptly by the roads north of the Chickamauga, as far as Ringgold, destroying their communications.

Early in December, 1863, Sherman, by forced marches, went to the relief of Burnside, who was besieged in Knoxville by Longstreet, and arrived just in time to save him from defeat. In February, 1864, with troops from the corps of Hurlburt and McPherson, he made a brief campaign to Jackson and Meridian to destroy the enemy's communications.

In the spring of that year Gen. Grant was made lieutenant-general, and planned a grand campaign in which all the military resources of the Northern States should be brought to bear at once upon the Confederacy and kept in active operation until its armies should be destroyed. To Sherman he assigned the command of the military division of the Mississippi. On Feb. 19 Sherman received the thanks of Congress for his services in the Chattanooga campaign, and in March he began repairing the railroads and making ready for the great task. He made his headquarters at Chattanooga, and concentrated his troops there. His force included the Army of the Cumberland, Gen. George H. Thomas; the Army of the Tennessee, Gen. James B. McPherson; and the Army of the Ohio, Gen. John M. Schofield. With about 93,000 men and 250 guns, leaving behind all unnecessary baggage, and taking no tents except for sick and wounded, he set forward on May 5 to attack the Confederate army at Dalton, which was commanded by Gen. Joseph E. Johnston, who had somewhat over 60,000 men (if counted in the same way in which Sherman's were counted). The campaign that followed, up to the date of Johnston's removal, July 17, is briefly described on page 399 of this volume.

Gen. John B. Hood, who succeeded Gen. Johnston, was as rash as Johnston had been cautious. On July 20, while Sherman's army was slowly closing in around Atlanta, the Confederates left their intrenchments along Peach-tree creek and made a heavy assault on the right of the national line, which was held by Thomas. There was terrible fighting, much of it hand-to-hand, for two hours, at the end of which time the Confederates were driven back to their works. Two days later Hood, by a flank movement, attacked Sherman's left, held by McPherson. The fighting was kept up from noon till night, and seven heavy assaults were repelled; after which Wood's division closed the battle with a counter-attack. On this day Sherman lost 3,500 men and 10 guns. Hood's loss

was never reported, but it was known to be much heavier. Gen. McPherson was killed, and Gen. Oliver O. Howard was promoted to command the Army of the Tennessee. This offended Gen. Hooker, who thought the promotion belonged to him, and he asked to be relieved. His corps was given to Gen. Henry W. Slocum.

Sherman now made another move by the right flank to threaten the enemy's communications, and on the 28th Hood made a bloody attack on his right, but did not effect anything. Sherman then sent out detachments of cavalry to break the railroads south of Atlanta, but with no satisfactory result. He therefore, after posting Slocum's corps at the bridge over the Chattahoochee, swung all the rest of his army, by a rapid and partly concealed movement, around to a position south of the city, where he destroyed the railroads and then advanced in force on Atlanta. He captured one brigade entire and 10 guns; but the greater part of Hood's forces, after setting fire to the Government property, escaped eastward, and Slocum's corps promptly moved in.

Gen. Sherman determined to make a purely military garrison or depot with no civil population, and he therefore ordered the inhabitants to leave the city, giving them their choice whether to go north or south; and this gave rise to an angry correspondence between him and Gen. Hood. The telegraph and railroad were repaired, and ample supplies were brought down from the North. For two months there was no significant change in the military affairs of that department. Sherman's army had reached the goal for which it set out, and the army of Hood moved about with apparently no very definite purpose, occasionally breaking the communications, which were quickly re-established, or attacking an outpost. At last Hood, late in October, moved to a point opposite Florence, on Tennessee river, and began collecting supplies for an invasion of Tennessee and Kentucky. Sherman sent Thomas to Nashville to meet this invasion, and proposed to march to Savannah with the remainder of his army; but he found considerable difficulty in persuading the President and Gen. Grant to consent to such a move. When at last he gained their consent he at once sent out men to cut the telegraph wires lest the orders should be countermanded, and years afterward he learned that they would have been countermanded had not the authorities at Washington found, as they supposed, that "the enemy had cut the wires." He sent to the rear all his sick and disabled men, and all baggage that could be spared, and had his men paid. When the last train left Atlanta he had a large section of the track destroyed and the bridges burned. Wagon trains were got in readiness and exact orders for the march were issued. The machine shops, depots, and other such buildings in Atlanta were torn down and fire set to the ruins.

Sherman had first definitely proposed the march to the sea in a telegram to Gen. Thomas, dated Oct. 9. On Nov. 12, with 55,000 infantry, 5,000 cavalry, and 1,800 artillerymen with 65 guns, he set out, and nothing more was heard of him till nearly Christmas. His army moved in two parallel columns, cutting through the State a swath 40 miles wide, and living off the coun-

try. Everything was done with perfect regularity. There were 2,500 wagons, each drawn by six mules, and these were distributed at intervals on the line. Foraging parties went out every morning, and what they obtained was brought to the line and placed in the wagons without stopping them for a moment. Nearly all of the Georgia Central Railroad was destroyed. No serious opposition was met, except that Wheeler's Confederate cavalry hung on the flanks of the army and occasionally had an engagement with Kilpatrick's. A few miles above Savannah there was some fighting with infantry, and Fort McAllister, guarding that city, was carried by storm. Here he established communication with the blockading fleet, and on Dec. 21 his troops marched into the city. His entire loss in the march to the sea was 764 men.

After remaining at Savannah four weeks, Sherman set out on a march northward through the Carolinas. He threatened both Charleston and Augusta, but passed between them and moved directly to Columbia. Thence he moved northeasterly, through Camden, Cheraw, and Fayetteville, to Goldsboro, and thence northward to Raleigh. This march was much more difficult than that through Georgia, for he had to cross large rivers, instead of moving parallel with them; but it lacked the mystery and romance of the other, and hence is not so famous. How he was opposed by a hastily gathered Confederate force under Gen. Joseph E. Johnston, at Averysboro and Bentonville, and how Johnston surrendered to him at Durham Station, near Raleigh, April 26, are told on page 400 of this volume. This great movement of Sherman's 60,000 veterans through the heart of the Confederacy hastened its downfall, and must shortly have compelled the surrender of Lee's army had his lines around Petersburg not been already broken by Grant.

The war being ended, Sherman's army passed in grand review in Washington, May 24, and a week later he took leave of them in a farewell order. For the next four years he was in command of the military division of the Mississippi, with headquarters at St. Louis. When Grant was made full general, July 25, 1866, Sherman was promoted to lieutenant-general; and when Grant became President, March 4, 1869, Sherman succeeded to the generalship, with headquarters at Washington. In 1871-'72 he made a professional tour in Europe. He was placed on the retired list, Feb. 8, 1884, and two years later he became a resident of New York city, living first at the Fifth Avenue Hotel and afterward in a house that he bought in West Seventy-first Street. His funeral was a grand military pageant, witnessed by tens of thousands of people. His body was taken to St. Louis and interred by the side of his wife, who had died about a year earlier. Gen. Sherman had in some respects a keener insight into men and affairs than any other of our great military men, and he was by far the ablest writer among them. His "Memoirs," written by himself, were published originally in 1875 (New York, 2 vols.), and were somewhat revised and re-issued in 1886. Besides this, his only book, numerous interesting letters of his are extant, for he was a voluminous correspondent. He had a genial and

kindly disposition, and enjoyed great personal popularity. He could easily have been President of the United States if he would have accepted the Republican nomination, and he was the only man that ever refused that office.

SOUTH CAROLINA, a Southern State, one of the original thirteen, ratified the Constitution May 23, 1788; area, 3,750 square miles. The population, according to each decennial census, was 249,073 in 1790; 345,591 in 1800; 415,115 in 1810; 502,741 in 1820; 581,185 in 1830; 594,398 in 1840; 668,507 in 1850; 703,708 in 1860; 705,606 in 1870; 495,577 in 1880; and 1,151,149 in 1890. Capital, Columbia.

Government.—The following were the State officers during the year: Governor, Benjamin R. Tillman, Democrat; Lieutenant-Governor, Eugene B. Gary; Secretary of State, J. E. Tindal; Treasurer, W. T. C. Bates; Auditor, W. H. Ellerbe; Attorney-General, Y. J. Pope, elected a justice of the Supreme Court by the General Assembly on Dec. 3, and succeeded by J. L. McLaurin, who was elected by the General Assembly on Dec. 9; Superintendent of Education, W. D. Mayfield; Railroad Commissioners, D'Arcy P. Duncan, Eugene P. Jervey, and — Thomas; Chief-Justice of the Supreme Court, Henry McIver, elected by the General Assembly on Dec. 1, the office having been vacant since the death of Chief-Justice W. D. Simpson, in December, 1890; Associate Justices, Samuel McGowan, Henry McIver, promoted as above stated, and Y. J. Pope, elected by the General Assembly on Dec. 3.

Population by Races.—The following table shows the white and colored population of the State in 1880 and 1890, as reported by the Federal census:

COUNTIES.	WHITE.		COLORED.	
	1880.	1880.	1890.	1880.

The State..... 454,474 391,195 692,500 604,822

In 1890 there were also in the State 20 Chinese and 172 Indians.

Finances.—The following is a summary of the operations of the State treasury for the fiscal year: Cash on hand Oct. 31, 1890, \$77,943.93; receipts from all sources, \$1,073,752.98; total expenditures, \$1,087,081.89; balance on Oct. 31, 1891, \$64,615.02. The receipts were derived from the following sources: From taxes 1889-'90 and back taxes, \$776,895.57; from phosphate royalty, \$184,502.46; privilege tax on fertilizers, \$53,285.85; sinking fund commissioners, \$18,788.29; railroad assessments, \$9,748.48; official fees, \$8,970.07; special funds, \$17,459.22; other sources, \$4,111.04. The expenditures may be classified as follow: Legislative expenses, \$42,652.01; public printing, \$22,199.73; educational, charitable, penal, and sanitary institutions, \$201,762.34; Clemson Agricultural College, \$107,878.35; pensions, \$49,191.82; commissioner sinking fund warrants, \$27,106.35; interest on public debt and expenses, \$354,520.75; loan under act 1889 and interest, \$50,500; completion of State House, \$17,577.30; election expenses, \$16,377.56; refund taxes, \$10,479.31; maintaining militia, \$10,413; salaries, \$142,446.09; other purposes, \$33,977.28.

During the year the Sinking-fund Commission purchased and retired brown consols amounting to \$26,911.72, thereby reducing the total bonded State debt to \$6,406,606. The debt is classified as follows: Brown consols, \$5,393,076.70; blue 4½-per-cents., \$400,000; brown 4-per-cents., 1890, \$29,396.70; Agricultural College scrip, \$191,800; deficiency stock outstanding, \$717.72; bonds and stocks still fundable in brown consols, \$391,614.88. Under the acts of 1889 and 1890, the State Treasurer has made but little progress in exchanging the Brown consols for the new 4-per-cent. bonds authorized by those acts, only \$29,396.70 being exchanged. In addition to the funded debt, the State owes a large floating debt, amounting to \$489,197.33, of which \$271,890.07 is due for unpaid interest and \$106,608.07 for unpaid appropriations. The State has practically no sinking fund.

Legislative Session.—The regular annual session of the General Assembly began on Nov. 24 and adjourned on Dec. 24. The act of 1889 providing for refunding the brown-consol bonds and stocks due in 1893 was amended at this session so as to allow the Governor and the State Treasurer to offer a commission to persons who place the new bonds. All the funds in the State sinking fund, and the sum of \$30,000 in addition, were appropriated to pay such commissions. An anti-free-pass law was enacted, prohibiting any person while a member of the Senate or House of Representatives, State or national, or any State or county official, or any judge of a court of record, from using any free pass, express or telegraph frank, or complimentary ticket, or from riding on any railroad in the State without paying the usual fare. Transportation companies were forbidden to issue such passes, or to give any special rate to such officials.

Emigrant agents, who in recent years have induced many negroes to leave the State, were prohibited from plying their vocation, except under conditions, every such agent being re-

quired to pay to the State annually a license fee of \$1,000 for each county in which he does business.

Provision was made for distributing the money received from the United States as a refund of the direct tax to the persons who originally paid such tax, or to their legal representatives. The sum of \$4,000 was appropriated to be expended, under the direction of a public-record commission, in obtaining copies of documents from the public archives of England which relate to the early history of the State.

An institution for the training and higher education of white girls was established, under the name of the South Carolina Industrial and Winthrop Normal College, the location to be determined by the board of trustees of the institution. The grounds, buildings, and equipment must be secured and transferred to the State without expense on its part, but the State undertakes the management of the institution after it is thus equipped. The members of the Lower House of the General Assembly were reapportioned to the several counties according to the census of 1890.

Other acts of the session were as follow:

Providing that no crop mortgage shall convey any interest in any crop other than that raised during the year in which the mortgage is given, and unless the land on which it is to be raised shall be described in said mortgage.

Accepting the provisions of the act of Congress under which the direct tax of 1861 was refunded to the several States.

To protect and encourage the planting and cultivation of shell-fish, to create the office of fish commissioner, and to authorize the granting of franchises for the use of certain lands under water belonging to the State.

Requiring the Sinking-fund Commissioners and the Fish Commissioner to establish regulations for the protection of the natural oyster beds of the State.

Education.—For the school year ending in 1891, 93,024 white children and 116,535 colored children were enrolled in the public schools, a total of 209,559. The average length of the school year was 3.21 months.

The South Carolina University, which has existed for nearly a century, was reorganized under the act of December, 1890, so that its work is now confined to liberal studies, the departments of science and agriculture having been transferred to Clemson Agricultural College. This change has reduced the number of students. For the school year 1890-'91 the number of attendants was 182, while for the session of 1891-'92 96 were matriculated. Work has progressed during the year on the buildings for the Clemson Agricultural College, and though they are not near completion the roll of applicants for admission numbered 870 at the close of the year. There had been expended up to Oct. 31, 1890, in the erection of buildings \$17,085.35, and during the fiscal year ending Oct. 31, 1891, \$106,127.26, making a total of \$123,213.61.

At the South Carolina Military Academy there were 166 pupils during 1890-'91.

Charities.—During the year 311 patients were admitted to the State Insane Asylum, 394 were discharged, and 747 remained, of whom 432 were white and 315 colored. The total income, including \$100,000 appropriated by the State,

was \$122,642.16, and the total expenses were \$113,706.37, leaving a balance of \$8,935.79.

At the Deaf, Dumb, and Blind Institute 133 pupils were enrolled during the year, 91 being deaf and 42 blind. The average attendance was 99. The receipts, including the State appropriation of \$14,000, were \$15,350.50, and the expenditures \$14,681.85, leaving a balance of \$668.65.

Penitentiary.—On Oct. 31 there were 793 persons confined in the State Penitentiary, against 791 on Oct. 31, 1890. The Columbia Canal, on which about 200 prisoners have been employed, was completed during the year, and a large majority of the convicts are now employed in farming, the State having purchased a farm to be worked by them. The revenue from convict labor during the year was not more than sufficient to meet the expenses of the institution.

Militia.—The total active militia of the State numbers 4,974 men, divided as follows: Cavalry, 28 companies, 1,224 officers and men; artillery, 3 companies, 540 officers and men; infantry, 43 companies, 2,373 officers and men; and National Guards, 16 companies, 837 officers and men.

Phosphate Commission.—On this subject Gov. Tillman reports as follows: "On the 1st of March, in accordance with the instructions of the act creating the commission, we took possession of Coosaw river and issued licenses to mine therein to three companies. Two of these entered the river, but were enjoined in the United States Court." The suit under which this injunction was issued is now pending on appeal before the United States Supreme Court, the question being upon the right of the State to grant such licenses.

Mining.—The value of the precious-metal product of South Carolina for 1890 was \$100,177.64, being an increase of \$530 over that of the preceding year. The product of gold was \$99,777.64, and of silver \$400. The production by counties was as follows: Chesterfield, \$20,841.81; Lancaster, \$76,339.92; Spartanburg, \$4,959.19; Union, \$500; miscellaneous, \$2,000. Nearly all comes from the Haile mine, in Lancaster County, and the Brewer mine, in Chesterfield County.

SOUTH DAKOTA, a Western State, admitted to the Union Nov. 3, 1889; area, 77,650 square miles; population, according to the census of 1890, 328,808. Capital, Pierre.

Government.—The following were the State officers during the year: Governor, Arthur C. Mellette; Lieutenant-Governor, G. H. Hoffman; Secretary of State, A. O. Ringsrud; Treasurer, W. W. Taylor; Auditor, L. C. Taylor; Attorney-General, Robert Dollard; Superintendent of Public Instruction, Cortez Salmon; Commissioner of School and Public Lands, Thomas H. Ruth; Commissioner of Labor, R. A. Smith. All these officers are Republicans. Chief Justice of the Supreme Court, A. G. Kellam; Associate Justices, Dighton Corson and John E. Bennett—all Republicans. The Senate consists of 23 Republicans, 7 Democrats, and 14 Independents. The House has 60 Republicans, 19 Democrats, and 45 Independents.

Valuations.—The State Board of Equalization and Assessment assessed nearly a million acres of land more than in 1890. Horses this year are assessed at \$34.62; cattle, \$9.25; mules

and asses, \$36; sheep, \$1.71; swine, \$1.77. Haul, stock is assessed at 55 cents on the dollar. The State and bond levy is 2-5 for this year, and the levy on telegraph, telephone, express, and sleeping-car companies is 1-25.

Education.—Disagreements at the State University at Vermilion culminated in the resignation of President Howard B. Groce in May, the closing of the institution in June, within a week of the time set for commencement, and the discharge of the old members of the faculty. At a special meeting of the board of directors in September, Dr. Charles O. Merion, of Mt. Pleasant, Iowa, a graduate of De Pauw University and a member of the faculty of Iowa Wesleyan University, was chosen president.

Yankton College enrolled 227 students in the year 1890-'91, and graduated a class of six. The Rev. E. F. Williams, D. D., of Chicago, was elected president; E. A. Bechtel, of Johns Hopkins University, to the professorship of Latin; and Prof. G. E. Culver, formerly of Dakota University, to that of Chemistry and Physics. An endowment has been made for the physical culture department. About 75 new students were enrolled in September.

The South Dakota Chautauqua Assembly held its first summer school at Lake Madison in July and August.

Crops.—Following is the average estimated yield in bushels per acre of staple crops, compiled from reports by regular correspondents of the State Weather Service, co-operating with the United States Department of Agriculture: Wheat, 17-6; oats, 39-8; corn, 30-7; barley, 31-8; rye, 19-7; potatoes, 139-5; flax, 9-6; sugar beets, 25-5.

The total wheat crop of the State is estimated at 32,000,000 bushels, oats at 27,500,000 bushels, corn at 26,000,000 bushels, barley at 5,500,000 bushels, rye at 700,000 bushels, flax at 4,000,000 bushels, and potatoes at 5,000,000 bushels.

The crop bulletin of September placed the State second as a wheat producer, marking it 99, and Minnesota 100. The of flax on 354,957 acres gave a harvest of 1,801,115 bushels of seed.

Mining.—The tin mines in the Black Hills are in active operation. The tin is claimed to be not so fine as the Cornish tin, but purer and easier to mine. One company reported in August 40,000 tons of ore ready for shipment, with 100,000 tons more in sight in the mines. This company has in hand the erection of a mill capable of disposing of 500 tons of ore a day. Nuggets have been found weighing from 30 to 75 pounds, and yielding over 75 per cent. of pure white metal. A property including 62 claims and 240 acres of placer ground in the Black Hills was sold in May for \$475,000 to the Rapid City Land and Improvement Company.

The total product of the precious metals for 1890, according to the report of the Director of the Mint, was, approximately, \$3,278,000; gold, \$3,112,000; silver, \$156,000.

The Soldiers' Home.—The report at the annual meeting in June showed a total of 75 inmates. One wing of the hospital was ordered built during the summer. The grounds south of the glen were ordered platted, and are to be leased to veterans whose wives are forty-five years of age or over, for sites for cottages. It

was decided to admit disabled veterans who have dependent families, if their income does not exceed \$400 per annum. Experience has shown that the pensions, if allowed to the inmates, cause much demoralization; and it was therefore thought best to make a rule that those having families should assign them the pensions, excepting a small amount for spending-money, and those who had not should place their pensions in the hospital fund, since the appropriation is not large enough to provide help in that department.

The Insane Hospital.—The whole number of inmates in this institution is 283, of whom 163 are men and 120 women.

Legislative Session.—The second Legislature met on Jan. 6, and adjourned on March 7. Much of the early part of the session was consumed in the election of a United States Senator to succeed Gideon C. Moody, whose term of office expired. The candidates of the three parties were changed during the course of the balloting, and at the fortieth ballot the choice fell on Rev. James H. Kyle, of Aberdeen, the Independent candidate. He received 75 votes, against 55 for Sterling, Republican. Considerable excitement was caused toward the close of the balloting by a resolution in which it was declared to be a "matter of common notoriety, based upon what appears to be good authority," that negotiations were pending between the Democrats and the Independents of Illinois and South Dakota. The object of these negotiations was said to be the election of the Democratic candidate in Illinois by the help of Independent votes, in exchange for Democratic help to the Independents in South Dakota.

The new Senator is a Congregational clergyman, a graduate of Oberlin College and of Allegheny Theological Seminary. He has had charge of several churches in the West, and was for some months previous to his election financial agent of Yankton College. In the election of 1890 he was chosen State Senator from Brown County, having attracted the favorable attention of the Farmers' Alliance party, it is said, by his utterances in a Fourth of July oration at Aberdeen. In the senatorial contest his name was substituted for Gen. Campbell's on the Independent ticket, on the thirty-first ballot. Senator Kyle took his seat on the Democratic side of the Senate chamber.

The Australian election law was passed, and a new revenue system was adopted. The penalty on delinquent taxes was changed from 3 to 1 per cent. on March 1, and 1 per cent. each month thereafter. Interest on delinquent taxes was cut down from 20 to 12 per cent. The county and State boards of equalization were given power to raise and lower assessed valuations, instead of power to raise them only.

A new apportionment reduced the membership of the Legislature from 169 to 126, giving the Senate 43 in place of 45, and the House 83 in place of 124.

A bill for township irrigation by artesian wells became a law. It was also made applicable to counties not having township organization.

A school law providing for uniformity of system throughout the State was one of the results of the session. A bill prohibiting an agreement

for the payment of mortgage indebtedness in any particular kind of money passed both Houses. It was feared that this law would prove a disadvantage to borrowers by causing the withdrawal from the State of many loan companies.

Among bills passed was a new fence law, which is of importance to the grazing interests. It provides that all unorganized counties of the State and all counties hereafter to be organized shall allow stock to run at large until decided otherwise by a majority of the people. The law has been tried in the Black Hills with success. The people of Pierre and representatives of the Black Hills are enthusiastic over the success of the bill.

Another measure that was passed makes it necessary for the auditor to turn over all insurance fees received, thus abolishing the office of commissioner of insurance.

A bill authorizing the Governor to convey to the United States Government, under certain conditions, the Soldiers' Home at Hot Springs, was vetoed, but was passed over the veto.

Other measures enacted were as follow:

Providing that school funds shall be invested only in first mortgages on farm lands and in State and national bonds.

Providing for the organization and management of State banks.

Accepting grants of money to the Agricultural College from Congress.

Making conveyance of homesteads valid and legal in case the owner is married, whether executed by joint instrument or separate instrument.

Prohibiting dower and courtesy, and confirming all conveyance of real estate except that of homestead.

Refunding Insane Hospital bonds.

Changing the name of Dakota Agricultural College to South Dakota Agricultural College, and also prefixing "South" to the name of Dakota University.

Providing for the issuance of funding warrants in payment of outstanding warrants, whenever such funding warrants can be negotiated at their face value or at a premium.

Authorizing the Board of Regents to hold farmers' institutes at the Agricultural College, for instruction in farming and dairying.

Limiting the tax levy in cities to ten mills; also limiting bonded indebtedness.

Joint resolution asking Congress to modify the patent and copyright laws, and to provide for construction of elevators for storing farm products.

To punish the creation of indebtedness against the State and the drawing of warrants without express appropriation; and fixing penalty of a fine of \$1,500 and imprisonment for not less than two or more than five years for violation.

Allowing counties to bond for irrigation.

The following is the list of appropriations for 1891-'92: For State officials, \$72,000; expenses of State offices, \$28,800; Legislature, \$73,418; printing, \$10,000; State University, \$41,100; Madison Normal School, \$18,600; Spearfish Normal School, \$21,400; Reform School, \$32,000; Agricultural College, \$12,000; School of Mines, \$16,000; Deaf-mute School, \$24,700; Penitentiary, \$57,900; Insane Hospital, \$120,500; Soldiers' Home, \$32,906; bonded indebtedness, \$108,000; public examiner, \$4,200; State militia, \$8,000; insurance of public buildings, \$1,800; Board of Charities, \$3,000; Board of Regents, \$2,000; mine inspector, \$4,000; Board of Agriculture, \$4,000; railroad commissioners, \$10,000; Commissioner of Labor and Statistics, \$2,750; main-

tenance of State House, \$6,140; trustees of educational institutions, \$3,000; commissioners of Soldiers' Home, \$1,500; engineer of irrigation, \$3,000; clerks at land office, \$1,200; total, \$723,914.

Prohibition.—A bill was introduced into the Legislature early in the session to resubmit the question of prohibition to the people, and was lost on the last day in the Senate, by a vote of 18 to 20, 7 members being absent. Actions were brought in Lawrence County in July, to test the validity of the law. The demurrers were sustained in all the four cases, the judge holding that the law is unconstitutional, on the ground that the title to the law does not fulfill the requirements of the Constitution which says, section 21, Article III, "No law shall embrace more than one subject, which shall be expressed in its title." The matter remains to be settled by the Supreme Court.

The World's Fair.—Attempts were made to secure an appropriation for a State exhibit at the World's Fair, but the Legislature adjourned without any such action. A convention, therefore, met at Yankton in May for the purpose of devising some method for meeting the expense of an exhibit. A commission of 18 members was selected to represent the State at the fair and have charge of its exhibit, and it was resolved to ask the Governor to call a special session of the Legislature to make an appropriation, in case a majority of the members would pledge themselves to vote for such appropriation, and that no other business be introduced.

The commission issued an address in September, in which it said that it was convinced, after proper effort, that no aid could be secured from the State treasury, and called for voluntary subscriptions to the amount of \$80,000. The project of an extra session was afterward revived, and the Governor promised to call one in case the commission would pledge itself that the extra session should cause no expense to the State.

Indian Lands.—The Indian title has been extinguished to all reservations east of the Missouri except the Yankton, and efforts are in progress to induce the Yanktons to sell, reserving only enough to give each member of the tribe a farm. A petition signed by 792 of the Sioux, was sent to Washington, asking for \$10,000,000 for the loss of game and other things. It says:

Sir: We Indians want to get paid for all these wild animals, once we live upon for our food. Not only those things, also there are all kinds of iron was found here, and I should mention some of names of these things. Buffalo, elk, black-tail deer, long-tail deer, big wolf, all other kinds of deer and wolf; also gold, silver; also all other kinds of iron.

The Sisseton and Wahpeton reservation will be thrown open to settlers in April, 1892. This consists of about 600,000 acres. It is a triangle about 70 miles long, decked with lakes and surrounded by a thrifty and well-settled country. The reservation has about a million acres, but the 300 or 400 adult Indians take their allotments first, and sections are set apart for school and other purposes. The lands are among the best for wheat and general agricultural uses in South Dakota.

State Lands.—A question has been before the General Land Office as to whether the com-

missioner of school and public lands could select lands upon the great Sioux reservation recently thrown open to settlement. The decision is that the land can not be selected upon these reservations. If the decision is upheld it will compel the selection of about 700,000 acres of indemnity lands from a small area in the Black Hills. A report in November of the inspection of the vacant lands for the purpose of selecting the 750,000 acres appropriated shows that the land commissioner has selected 500,000 acres and has already filed upon 400,000 acres. About 200,000 acres was selected in the Black Hills country, and the other 300,000 acres in the counties of Hand, Hyde, Codington, Day, Potter, Edmunds, McPherson, Walworth, and Campbell, these being all the counties east of the river where vacant lands can be found. The remaining 250,000 acres which are due the State the commissioner is in no hurry to select.

At the sale of school lands in the spring the average price realized was \$14.05½ an acre, and the entire amount \$631,528.20; of which the amount paid down was \$164,271.50.

The Northern Boundary.—At the session of Congress of 1890-'91 an appropriation of \$25,000 was made for marking the boundary between the Dakotas. The line is 361½ miles long. The 157 miles that have already been surveyed are to be reviewed and the survey completed; it is expected that the work will be finished in 1892. The line will be marked with 725 granite pedestals from the Sioux Falls quarries.

Irrigation.—The experiment of irrigating land from artesian wells has been largely tried, and has proved successful. The water can be first used for domestic and manufacturing purposes. A report in June says: "The artesian belt of James river valley is the largest body of water of its character known to the world, containing about 7,000,000 acres, of which 98 per cent. could be made available for tillage. There are in all nearly or quite 100 flowing wells in Dakota. The flow of water ranges per minute from 4,000 gallons at Columbia, 3,500 at Aberdeen, and 1,500 at Yankton. The depth of these wells is from 1,576 feet at Jamestown to 600 at Yankton and Frankfort."

The only fear has been that the source of water supply might prove inadequate when great numbers of wells were sunk, but Government experts who have made careful survey of the country say that no fear need be entertained on that score. In one locality two of these wells stand 700 feet apart and pour forth powerful streams constantly.

Missouri River Improvement.—Chas. F. Powell, engineer in charge, reports almost a complete survey of the river from Benton to Bismarck. He asks for an appropriation of \$150,000 for the rectification of the river at important commercial points in order to reclaim the steamboat landings, which have been injured by a shifting of the channel to the opposite side.

A pontoon bridge has been built across the river at Yankton, having a roadway 850 feet in length supported by 39 pontoons.

Railroads.—So large was the crop this year that means of transportation were procured with difficulty. Several new lines are under discus-

sion—the extension of the Illinois Central into the Black Hills country; that of the Chicago, St. Paul, Minneapolis and Omaha to Niobrara or Yankton; that of the Fremont, Elkhorn and Missouri Valley to West Niobrara; and a line to connect Yankton with the Nebraska system of the Northwestern passing through Cedar and Knox Counties; while the Rapid City and Missouri River and St. Paul is expected to have cars running into the Black Hills before another winter. A bill was introduced into Congress to authorize the construction of a drawbridge across the Missouri at Yankton by a company incorporated for that purpose, for the use of any or all railways constructed to cross the river at that point, and also for wagons and pedestrians; it was referred to the Committee on Commerce.

Special Election.—Hon. John R. Gamble, one of the representatives of the State in Congress, died at Yankton, Aug. 14, 1891. The Governor issued a proclamation on the 26th calling for a special election to be held Nov. 3. The Republicans nominated John L. Jolley, of Clay County; the Democrats, James M. Woods, of Rapid City; and the Independents, Henry W. Smith, of Wayne. The election resulted as follows: Jolley, 17,614; Smith, 14,587; Woods, 7,188. The new (Australian) election law was tried at this election with good success.

SOUVENIR SPOONS. No fad of recent times has advanced so rapidly and taken so strong and perhaps permanent a hold as that of souvenir spoons. These medals—for they are pieces of metal “bearing devices and inscriptions struck or cast to commemorate a person, an institution, or an event”—are generally of silver, sometimes with gold bowl, but seldom all of gold. In shape they are usually of coffee, tea, or orange pattern; sometimes pap, dessert, sherbet, chocolate, sugar, and bon-bon forms are offered; while the design at times extends to almond scoops, pickle forks, sardine forks, ice-cream forks, child's forks, butter knives, butter spreaders, paper knives, and sugar tongs.

It is said that the oldest piece of silverware known is a spoon. Before knives or forks were employed the spoon was a household necessity. The derivation of the fad was from Europe, and tourists for many years have collected copies of the celebrated apostles' spoons. Special designs characteristic of places on the Continent have long been known. In the summer of 1887 M. W. Galt, of Washington, D. C., while traveling abroad conceived the idea of applying the fancy to this country, and on his return produced the first Washington spoon, showing the head of the Father of his Country. From the outset the venture proved a success, and a year later Daniel Low, of Salem, Mass., brought out his first witch spoon. Thus started, the idea grew until it has extended to every place of importance in the country, and even many of the smaller towns have their souvenir spoons. For the most part these spoons chronicle some historical event connected with the locality, or else a characteristic building or scene; failing in these, the memory of some distinguished person is perpetuated by the spoons. At first the designs were simple, but many are now quite complex. The most interesting spoons are those of the Eastern States, of which the following are representa-

tive: Newburyport shows the eccentric figure of Lord Timothy Dexter; Plymouth, the landing of the Pilgrims, or else the rock itself; Lynn, Moll Pitcher and her black cat; Hartford, the Charter Oak; Springfield, the likeness of her pioneer, Miles Morgan; Boston, the pot of baked beans; Cambridge, the statue of John Harvard; and Portland, her observatory. New York has several designs, one showing the East River Bridge; another, the Bartholdi statue; still another, Peter Stuyvesant; while Philadelphia has Independence Hall and Liberty Bell on her spoons. Albany preserves the memory of Diedrich Knickerbocker; Buffalo shows the head of a bison; Rochester, her famous Genesee Falls. To the South, Baltimore has her battle monument and the terrapin and oyster; Charleston, Fort Sumter; and Savannah, Gen. Greene's monument and her City Hall; while Jacksonville has an alligator, and St. Augustine the city gates. Atlanta commemorates her orator, Henry W. Grady; Richmond, the monument of Robert E. Lee; St. Louis shows the Veiled Prophet; Denver, her Rainbow Falls; San Francisco, the Golden Gate; Portland, Oregon, Mount Hood; St. Paul, Fort Snelling; and Minneapolis, the Flour City, a bag of wheat. For description of these, and illustration, see “Souvenir Spoons of America” (New York, 1891). Besides the foregoing there are numerous spoons pertaining to distinguished individuals, as the Ben Butler spoon of Lynn, Mass., the Chauncey M. Depew spoon of Peekskill, the Longfellow, Whittier, Gen. Sherman, John Brown, and similar spoons. Perhaps among these should be included the several Christopher Columbus spoons, the Frances E. Willard and Sarah Bernhardt spoons. The Grand Army of the Republic, the Benevolent Order of Elks, the Chautauqua Literary and Scientific Circle, the King's Daughters, and similar organizations, have special spoons. There are certain State spoons, as that of Kansas with its sheaf of wheat, and the New Jersey with its handle representing a cat-tail, and a mosquito in the bowl. Also there are special national spoons, as the Brother Jonathan, the historical cannon, All America, and Uncle Sam. Spoons with appropriate designs for Easter and for card parties (known as whist and euchre spoons) exist. Several special designs have been made to present at theatres on souvenir nights; also in several instances they have been used for ad-

vertising; thus special guests of certain hotels are presented with spoons, and certain large manufacturing firms have given spoons of characteristic designs to favored individuals. The following list gives as far as possible the places where special souvenir spoons can be procured: Alaska, Albany, Atlanta, Baltimore, Bar Harbor, Boston, Bridgeport, Brooklyn, Buffalo, California, Cambridge, Catskills, Charleston, Chicago, Cleveland, Concord, Mass., Dayton, Denver, Detroit, District of Columbia, Florida, Gettysburg, Hartford, Haverhill, Johnstown, Kansas City, Lexington, Lincoln, Lockport, Los Angeles, Louisville, Lynn, Macon, Manitou, Memphis, Milwaukee, Minneapolis, Mount Vernon, Mount Washington, Narragansett, New Bedford, Newburgh, New Haven, Newport, New York, Niagara, Omaha, Philadelphia, Pittsburg, Pittsfield, Plymouth, Portland, Me., Portland, Ore., Portsmouth, Providence, Quebec, Reading, Richmond, Rochester, Salem, San Francisco, Saratoga Springs, Savannah, St. Augustine, St. Louis, St. Paul, Steubenville, Syracuse, Toronto, Troy, Utica, Waltham, Washington, Watch Hill, Worcester. The following personal spoons have been made: Ethan Allen, George Bancroft, P. T. Barnum, Henry Ward Beecher, Daniel Boone, John Brown, Benjamin F. Butler, Sarah Bernhardt, Christopher Columbus, Chauncey M. Depew, Timothy Dexter, Neal Dow, Hannah Dustin, Leif Ericsson, Benjamin Franklin, James A. Garfield, U. S. Grant, John Harvard, Anneke Jans, Diedrich Knickerbocker, Robert E. Lee, Abraham Lincoln, Henry W. Longfellow, Miles Morgan, Moll Pitcher, Priscilla Alden, Israel Putnam, Paul Revere, William T. Sherman, Miles Standish, Peter Stuyvesant, George Washington, John G. Whittier, Frances E. Willard, and Roger Williams.

SPAIN, a monarchy in southern Europe. The royal prerogative is exercised during the minority of the infant King, Alfonso XIII, born May 17, 1886, the posthumous son of Alfonso XII, who died Nov. 25, 1885, by the Queen-mother Maria Christina, daughter of the Archduke Karl Ferdinand of Austria. She first took the oath as Queen-Regent on Nov. 26, 1885, to serve during the minority of her daughter, Maria de la Mercedes, who was proclaimed Queen on her father's death. When a male heir was born he succeeded his sister, and the Queen-mother was sworn again to act as Regent for the King. The legislative power is vested in the Cortes, consisting of the Senate and the Congress, which have concurrent and equal authority. There are 100 life Senators nominated by the King; about 80 Senators by right of birth or office, viz., Grandees of Spain with 60,000 pesetas income, princes of the blood royal, the chief judges, archbishops, captains-general, and admirals; and 180 Senators chosen for five years by the provinces, communes, universities, and ecclesiastical bodies. The Congress consists of 431 Deputies, of whom 88 are elected in 26 districts on collective tickets, with provision for the representation of minorities, 10 may be chosen by a cumulative vote in several districts, and the rest are chosen by the Electoral Juntas of the ordinary districts in the proportion of 1 to 50,000 inhabitants in Spain, and 1 to 40,000 free persons in the Antilles. The Ministry constituted July 5, 1890, was made up of the

following members: President of the Council, Antonio Canovas del Castillo; Minister of Foreign Affairs, C. M. O'Donnell, Duke of Tetuan; Minister of Finance, F. Cos-Gayon; Minister of the Interior, F. Silvela; Minister of Justice, R. F. Villaverde; Minister of Instruction, and of Commerce and Agriculture, S. de Isasa; Minister of War, Gen. de Ascarra; Minister of Marine, J. M. Beranger; Minister of the Colonies, A. Fabié.

Area and Population.—The area of Spain, including the Canary and Balearic Isles and 13 square miles on the northwest coast of Africa, is 197,670 square miles. The population, according to the corrected returns of the census of Dec. 31, 1887, was for Continental Spain, 16,955,090; for the Canaries, 291,625; for the Balearic Islands, 312,593; and for the district in northern Africa, 5,280; making a total of 17,564,588. The legal population on Dec. 31, 1877, was 17,650,234, comprising 8,724,846 males and 8,925,388 females. The population of the chief cities was as follows: Madrid, 470,283; Barcelona, 272,481; Valencia, 170,763; Sevilla, 143,182; Malaga, 134,016; Murcia, 98,538; Saragossa, 92,407; Grenada, 73,066; Cadiz, 62,531; Valladolid, 62,012; Palma, 60,514.

Finances.—The revenue as estimated in the budget for the year ending June 30, 1892, is 865,551,387 pesetas or francs, of which 269,549,110 pesetas are the product of direct taxes, 298,985,000 pesetas come from indirect taxes and customs, 170,856,000 pesetas from stamps and *régie* enterprises, 35,571,277 pesetas from Government property, and 30,560,000 pesetas from the public treasury. The expenditures are estimated at 810,663,413 pesetas, of which 9,500,000 pesetas are for the civil list, 1,749,205 pesetas for legislative expenses, 262,803,189 pesetas for the public debt, 1,888,733 pesetas for judicial expenses, 52,481,545 pesetas for indemnities and pensions, 1,384,217 pesetas for the presidency of the Council of Ministers, 5,160,692 pesetas for the Ministry of Foreign Affairs, 56,758,958 pesetas for the Ministry of Justice, 146,220,530 pesetas for the Ministry of War, 32,088,598 pesetas for the Ministry of Marine, 20,167,893 pesetas for the Ministry of the Interior, 88,269,724 pesetas for the Ministry of Public Works, 19,104,714 pesetas for the Ministry of Finance, and 84,085,915 pesetas are the cost of collecting the revenue. The funded public debt on Jan. 1, 1890, amounted to 6,207,027,484 pesetas, on which the interest, reckoned for the most part at 4 per cent., was 233,312,491 pesetas. The floating debt was 285,210,000 pesetas, and the Cuban debt about 250,000,000 pesetas.

The Army.—Military laws enacted in 1877, 1878, and 1882 make service obligatory from the age of twenty for twelve years, of which three are passed in the active army, three in the first reserve, and six in the second reserve. Exemption may be purchased by the payment of 1,500 pesetas, and substitution among brothers is allowable. The peace effective in 1891 was as follows: Infantry, 90,327 men; cavalry, 13,968 men, with 11,887 horses; artillery, 11,340 men, with 392 guns; engineers, 4,279 men; artificers, 1,185 men; sanitary corps, 506 men. Including officers, the total peace strength is about 120,000 men, exclusive of the gendarmerie. The war

effective is approximately estimated at 734,680 infantry; 23,300 cavalry, with 18,500 horses; 30,350 artillery, with 460 cannons; 7,500 engineers; 1,900 workmen; 670 sanitary troops; and 7,000 territorial troops in the Canary Islands; making a total of 805,400 men, without reckoning the troops in the colonies. The Government has decided to adopt the Mauser rifle for the infantry.

The Navy.—The naval forces consist of 2 first-class ironclads built in 1886, 2 second-class ironclads, 4 unarmored ships of the first, 8 of the second, and 13 of the third-class, 4 gunboats, 32 small steamers, 13 torpedo boats, and 6 transports. There were under construction 2 first-class armorclads, 1 of the second class, 2 first-class, 1 second-class, and 4 third-class unarmored steamers, 1 deck-protected cruiser, and 3 armored gunboats. The "Biscaya," the second of three plated cruisers ordered in June, 1889, from the firm of Rivas & Palmer, of Bilbao, was launched on July 8, 1891, and the third was launched in October. The "Biscaya" is similar in all details to the "Infanta Teresa," which was launched in September, 1890.

Commerce.—The total value of imports in 1889 was 866,311,000 pesetas, and of exports 896,856,000 pesetas. The foreign commerce was divided among the principal nations as is shown in the following table, giving the values of the imports from and of the exports to each one in pesetas:

COUNTRIES.	Imports.	Exports.
France.....	264,300,000	386,500,000
Great Britain and Gibraltar.....	161,300,000	211,200,000
Germany.....	53,500,000	15,000,000
Belgium.....	30,000,000	19,900,000
Portugal.....	16,900,000	43,500,000
Sweden and Norway.....	29,000,000	1,400,000
Russia.....	19,700,000	800,000
Italy.....	19,500,000	9,500,000
Turkey.....	12,700,000
Netherlands.....	1,400,000	16,500,000
America.....	180,700,000	161,300,000
Philippine Islands.....	23,100,000	8,700,000
Northern Africa.....	18,500,000	7,600,000
Other countries.....	35,700,000	14,700,000
Total.....	866,300,000	896,900,000

The principal imports and their values were as follow: Cotton, 89,167,000 pesetas; woods, 45,947,000 pesetas; coal, 40,374,000 pesetas; sugar, 35,523,000 pesetas; machinery, 33,652,000 pesetas; woolen goods, 29,839,000 pesetas; tobacco, 28,800,000 pesetas; codfish, 27,435,000 pesetas; iron, 26,580,000 pesetas; wheat, 26,156,000 pesetas; hides and skins, 19,190,000 pesetas; chemicals, 16,603,000 pesetas; silk manufactures, 14,762,000 pesetas; linen thread, 14,723,000 pesetas; spirits, 14,484,000 pesetas; cotton goods, 13,273,000 pesetas; animals, 13,109,000 pesetas; cacao, 12,853,000 pesetas; petroleum, 11,820,000 pesetas; ships, 10,051,000 pesetas. The values of the chief exports of domestic products were as follow: Wine, 282,441,000 pesetas; copper, 61,812,000 pesetas; iron, 55,568,000 pesetas; lead, 48,358,000 pesetas; olive oil, 26,827,000 pesetas; cork, 21,606,000 pesetas; animals, 21,083,000 pesetas; oranges, 19,554,000 pesetas; raisins, 17,340,000 pesetas; boots and shoes, 15,917,000 pesetas; wool, 15,531,000 pesetas; quicksilver, 11,057,000.

Navigation.—The number of vessels entered at Spanish ports during 1889 was 53,549, of 22,905,463 tons, including 475 vessels of war, of 563,935 tons. Of the merchant vessels, 38,852, of 9,995,333 tons, were Spanish, and 14,222, of 12,346,195 tons, were foreign. The merchant marine in 1890 comprised 1,359 sailing vessels of over 50 tons, having an aggregate burden of 253,426 tons, and 350 steamers of over 100 tons, of the aggregate net tonnage of 273,819 tons.

Railroads, Posts, and Telegraphs.—The total length of the railroads at the beginning of 1889 was 6,043 miles. All the railroads were built and operated by private companies, though nearly all had their bonds guaranteed or received subsidies from the Government.

The post-office in 1889 forwarded 99,751,000 domestic and 12,600,000 international letters, 918,000 domestic and 222,000 international post-cards, 34,727,000 domestic and 16,025,000 international printed inclosures and packets, and 89,000 domestic and 25,000 international registered letters of the value of 119,201,000 and 31,275,000 francs, respectively. The receipts were 21,803,665 pesetas, expenses 12,274,634 pesetas.

The length of telegraph lines on Jan. 1, 1890, was 24,301 kilometres, or 14,270 miles, with 54,800 kilometres, or 34,250 miles, of wires, not including 8,734 kilometres of lines belonging to railroad companies. The number of internal dispatches was 3,164,796; of international dispatches, 932,848; of dispatches connected with the service, 142,784; the receipts for 1889-'90, 5,298,416 pesetas; expenses, 7,229,755 pesetas.

The New Cortes.—The first Cortes under the Regency, having completed the full term of five years, was dissolved on Dec. 30, 1890, and elections were appointed for Feb. 1, 1892, for the House of Deputies, and for Feb. 15 for Senators in the new Cortes that was to meet on March 2, under the new Government presided over by Canovas del Castillo. The elections were the first that took place under the law of universal suffrage, and were conducted by the Conservative party, which had strenuously opposed the passage of that law. In the elections for Deputies the most remarkable feature was the strength displayed by the Republicans, who elected their candidates by large majorities in five of the great towns, and would have won in Madrid, Barcelona, Saragossa, Sevilla, and Cadiz, in which they were beaten by the Conservatives, if the party had not divided into two factions. In Barcelona, Saragossa, and Valencia they obtained more votes than the Liberals, although workingmen and Socialists largely abstained from voting. The Republican leader, Nicolas Salmeron y Alfonso, candidate in one of the suburbs of Barcelona, was believed by the people to have been elected, and great indignation was caused when Señor Puig, the Conservative candidate, was declared to have received the most votes. The announcement was made on the day after mounted gendarmes had charged without provocation and without warning upon a crowd who were listening to a speech from Señor Salmeron and had fired their carbines, dangerously wounding many people, and apparently aiming at the orator. Fights between Liberals and Carlists occurred in several towns. An unusual number of parties placed separate candidates in the field. Besides the

Liberals, or Liberal-Fusionists, led by Señor Sagasta, and the Conservatives, under the leadership of Señor Canovas, there were the Señor Romero y Robledo's Reform Party, Señor Castelar's Republicans, the Federalists, the Zorillist Republicans, the Martists, the Carlists, and the Socialists. About 288 seats were won by the Conservatives, including 9 in Puerto Rico and 20 in Cuba, where the Autonomists largely abstained from voting. Against the Government were 88 Fusionists, 27 Republicans, 13 Romerists, 10 of the Cuban Opposition, 8 Carlists, 8 Martists, and 2 Puerto Rican Autonomists. Of the Republicans, about two fifths were followers of Salmeron, while the other Republican seats were nearly equally divided among the Zorillists or Revolutionary party, the Possibilists, and the Federalists, with whom the Castelar Republicans united. Of Sagasta's Fusion party about three eighths were Constitutional Liberals, one fourth were Democrats, one fifth were Liberal Conservatives, and one sixth Gamazist Protectionists. The Senatorial elections gave seats to 150 Conservatives, 19 Fusionists, 7 Reformists, 2 followers of Señor Martos, 1 Republican, and 1 Carlist.

The Cortes were opened on March 2 by the Queen in a speech of clear import, promising the continuance of the reform legislation begun by the Fusionist Cabinet, and the completion of the new laws of worship, justice, and civil administration; a protective tariff which would effect an equilibrium of the budget; reforms in the penal code and in the army and navy regulations; an amnesty for political offenders, but without the restitution of military grades; measures for the advantage and protection of the working classes; reforms in the public accounts, in municipal and provincial government, in education, in the regulation of railroads and of mines, and in the patent laws; liberal electoral laws for the West Indies; and a thorough reformation of the finances, including retrenchments sufficient to meet the deficit, new credits only for the augmentation of the navy, the consolidation of the floating debt, and measures to improve the condition of the notes of the Bank of Spain. The continuance of negotiations with France in regard to the frontier in Guinea was announced, as well as the settlement of claims on Morocco. The commercial treaties had been denounced with a view to negotiate new ones that would conform to the protectionist policy, and an understanding with the United States for a new convention was looked for. At the beginning of the session the Prime Minister introduced a bill prohibiting Sunday work in industrial and commercial establishments for minors under the age of eighteen years, and for workmen of all ages in establishments belonging to the state or to municipalities. A bill which engrossed the attention of the public, and was regarded by many as mischievous, proposed to empower the Bank of Spain to increase its issue of notes to 1,500,000,000 pesetas on condition that it should increase its metallic reserve from one fourth to one third of the amount of notes issued, one half to be held in gold and one half in silver, with further power to enlarge its circulation indefinitely, provided that emissions beyond the 1,500,000,000 pesetas be secured by reserves of half their amount in metal. The object of the bill was to enable

the bank to advance money to the Government, which needed 600,000,000 pesetas to pay for railroads, the new fleet, and other pressing requirements. The measure as passed limited the note issue to 1,500,000,000 pesetas, which was double the existing maximum, and extended the bank's charter till 1922; and in return for these concessions the Government received an advance of 150,000,000 pesetas for thirty years without interest, of which 87,000,000 pesetas were to be expended for naval construction in accordance with the law of July, 1888; 15,000,000 pesetas for war material for the army; 35,000,000 pesetas for railroad subventions; and 13,000,000 pesetas on harbor improvements, canals, and other public works. Another law authorized the issue of 250,000,000 pesetas of Government bonds, running thirty years and bearing 4 per cent. interest. The bill granting a general amnesty to political offenders, in fulfillment of the promise in the Queen's speech, gave all refugees and exiles the right to return to Spain, if they availed themselves of the amnesty within the next four months, and restored to army officers their right to a retiring pension, reckoning seniority from the date when they left the service.

Insurrectionary Movements.—Before May 1 strikes and broken out in Bilbao, Cartagena, and other places. On the Socialist labor day excited meetings of working men took place at Madrid and the principal industrial centers. Señor Canovas made a declaration that the eight-hour working day should be secured by international legislation, but that it was not for Spain to take the lead in the matter. On May 1 the ship-yards of Rivas & Palmer were burned in Bilbao, it was supposed by incendiaries, and several disturbances occurred while the strike lasted. At Cadiz and elsewhere there were mysterious explosions of bombs. Masons, tailors, bakers, and members of other trades struck in Barcelona for the eight-hour day in May, but returned to work after a few days. After the closure of the Cortes on July 13, labor disturbances were renewed; and when disastrous floods caused distress throughout southern Spain, menacing demonstrations of working men were organized in the affected provinces.

On Aug. 2 an attempt was made by Federalist Republicans to incite a revolt of the garrison at Barcelona. A band of 15 men, armed with rifles and revolvers, attempted to surprise the sentries and gain entrance into the barracks. On being detected, they made a rush for the entrance, firing their weapons and wounding some of the guards, who answered their fire. After a brief fight the foolhardy revolutionists, who expected the garrison to mutiny at their signal, were overpowered and captured.

Cabinet Crisis.—The financial position of the Government was not strengthened by the devices of Señor Cos-Gayon, and was rendered critical by the decline of Spanish *rentes* in the Paris Bourse, and by disastrous floods which in the autumn swept away the crops in the provinces south of the Ebro. The rice crops in Valencia, the raisin harvest in Malaga, the vintage in Almeria, and the grain and potato crops and the live stock in these provinces and in Murcia, Toledo, and Saragossa, were almost annihilated. The whole town of Consuegra was destroyed by a

torrential inundation on Sept. 11, and some 1,200 persons, more than one quarter of the population, were drowned. Although the Conservative majority outnumbered the followers of Señor Sagasta in the Cortes three to one, Señor Canovas saw the necessity of strengthening the Cabinet, and invited the support of the Reformists, who had expressed entire approval of the objects and methods unfolded in the ministerial programme. Admiral Beranger, in endeavoring to carry out the extensive scheme of naval reform, gave offense to many, and was subjected to attacks in the newspapers which impelled him to resign. The Prime Minister, on Nov. 9, took charge of the Marine Department *ad interim* pending the appointment of a successor of Admiral Beranger. He found the officers of the navy who possessed the necessary capabilities unwilling to accept the post under the circumstances. Señor Silvela had differences with the Prime Minister of long standing, and a reconstruction of the Cabinet was considered expedient by Señor Canovas, who expected to tide over the crisis by a slight modification of the ministerial policy and some exchanges of portfolios. When he found that the Minister of the Interior had sympathizers within the Cabinet, he declared the crisis political at the meeting of Nov. 21, in which Señor Silvela expressed his determination to retire. After a heated discussion, at the suggestion of the Minister of Justice, Señor Villaverde, the members of the Council voted to tender their resignations to the Queen-Regent in a body. A new Cabinet was formed on Nov. 23, in which Señor Romero and his lieutenant, Señor Elduayen office. The Cabinet as finally constituted was took as follows: President of the Council, Antonio Canovas del Castillo; Minister of Foreign Affairs, the Duke of Tetuan; Minister of the Interior, Señor Elduayen, Marquis del Pazo de la Merced; Minister of War, Gen. Azarraga; Minister of Marine, Vice-Admiral Montojo; Minister of Finance, Concha Castañeda; Minister of the Colonies, Señor Romero y Robledo; Minister of Justice, F. Cos-Gayon; Minister of Public Works, Commerce, and Agriculture, Señor Linares Rivas. Señor Canovas sent statements to the Spanish ambassadors and ministers, and to the Governors of provinces, intimating that the foreign policy of the new Cabinet would differ in no way from that of its predecessor, and that its domestic policy would be to realize economies and to foster public liberty as far as was compatible with tranquillity.

The Colonies.—Including the Antilles (see CUBA AND PUERTO RICO), the ultramarine possessions of Spain have an aggregate area of 406,903 square miles, and a population of 9,404,400, according to the most recent estimates. The most important of the colonies, besides the West Indian Islands, is the Philippine Islands, which had in 1887 a population of 6,985,123, including 1,000,000 unsubdued natives. Other possessions in the South Sea are the Sulu, Marianne, and Caroline Islands, with a population of 120,000. In Africa the Spanish occupy a tract of 243,000 square miles in the region of the Rio de Oro and Adrar. They claim a much larger territory there and on the mainland opposite Corisco and Elobey, where the territory actually occupied is confined to those islands and the Cape of San

Juan. The French Government disputed their pretensions, agreeing only to grant commercial freedom on the Muni river, where there are Spanish settlements, and also on the Benito river. As regards the Rio de Oro, the French Government in 1886 agreed to make an equal division of the Cape Blanco peninsula by a line which would extend into the interior along the parallel of 21° 20'. A joint commission for the settlement of these disputes met in Paris in the beginning of 1891. The question of the Rio de Oro territory was at once excluded from the deliberations, because the Spanish commissioners assumed that the dividing line extended indefinitely into the interior, embracing a part of the Algerian *Hinterland*. The commissioners were no better able to reach a common understanding regarding the historical claims of Spain to the large region inclosed by the Muni and Benito rivers, and consequently they separated in the beginning of April after deciding that the questions in dispute should be referred to arbitration. The Spanish authorities have been at war with the natives both of the Philippines and the Caroline Islands. American missionaries interceded in 1890 to save the inhabitants of the Caroline Islands from the cruelty and oppression of Spanish soldiers, and the governor promised to grant protection. Some time afterward the natives rose in rebellion and drove out their oppressors, who were lascars from Manila, not Spaniards. This led to the bombardment of Ponape and other villages and the expulsion of Americans. In the first attempt to land, 40 Spanish soldiers were killed, and in the course of the war about 300 native warriors fell. The budget of receipts in the Philippine Islands for 1890 was \$9,837,896, while the expenses were estimated at \$11,201,810, of which \$5,611,557 were for the army and navy. The Spanish force maintained there numbered 452 soldiers and 2,818 sailors. The imports in 1887 were valued at \$17,530,293, and the exports at \$25,254,140. The chief exports are tobacco, sugar, coffee, and manilla hemp, the exports of the first being valued at \$7,995,726, those of hemp and manufactures of hemp at \$5,460,454, those of tobacco and cigars at \$2,024,767, and those of coffee at \$2,093,518. Other articles of export are dyewoods, indigo, and skins. The number of vessels entered during 1887 was 438, of 359,999 tons, and the number cleared was 435, of 345,350 tons. There is a railroad building to connect Manila with Dagupan, the distance being 120 miles.

SWEDEN AND NORWAY, two kingdoms in the north of Europe united in the person of the sovereign, and having a common diplomacy directed by a Council of State in which both nations have representatives. The reigning King is Oscar II, born Jan. 21, 1829, who succeeded Carl XV, his brother, on Sept. 18, 1872. The heir-apparent is the King's oldest son, Gustaf, Duke of Wermland, born June 16, 1858.

SWEDEN.—The legislative power is vested in a Diet, consisting of two chambers, one of 147 members, elected for nine years by the communes, and the other of 228 members, elected for three years by direct suffrage in towns, and by either direct or indirect suffrage, as the majority decides, in the rural districts. The following ministers were in office in the beginning of 1891:

Johan Gustaf Nils Samuel Akerhjelm, Minister of State; Count Carl Lewenhaupt, Minister of Foreign Affairs; August Ostergren, Minister of Justice; Baron Nils Axel Hjalmar Palmstierna, Minister of War; Baron Carl Gustaf von Otter, Minister of Marine; Victor Lennart Groll, Minister of the Interior; Baron Fredrik von Essen, Minister of Finance; Gunnar Wennerburg, Minister of Education and Ecclesiastical Affairs; Baron Albert Lars Evert Akerhjelm; Sven Herman Wikblad.

Area and Population.—With an area of 170,979 square miles, Sweden has a population, according to the preliminary results of the census of Dec. 31, 1890, of 4,784,675 individuals, of whom 2,317,105 are of the male and 2,467,570 of the female sex. The marriages in 1889 numbered 28,478; births, 135,586; deaths, 79,641; surplus of births, 55,945. The emigrants in 1889 numbered 3,336, and the immigrants 5,504. There are 16,976 Finns, 6,404 Lapps, and about 18,000 Norwegians, Danes, Germans, and other foreigners. The chief cities are Stockholm, having 246,154 inhabitants in 1890; Göteborg, with 104,657; Malmö, with 48,504; and Norrköping, with 32,826. Elementary education is universal. The University of Upsala had 1,791 students and the University of Lund 855 in 1889, and there were 14,062 pupils in the public high schools, 872 in people's high schools, 907 in normal schools, 459 in technical schools, and in 1888 there were 685,212 in the public elementary schools.

Finances.—The budget for 1892 makes the total receipts from the ordinary sources of revenue—that is, from the land tax, personal tax, navigation dues, domains, forests, railroads, telegraphs, etc.—20,490,000 kronor (the Swedish krona or Norwegian krone is worth 27½ cents). The extraordinary receipts were estimated at 68,780,000 kronor, 38,000,000 kronor being set down for customs, 7,700,000 for postal receipts, 3,600,000 for stamps, 13,700,000 for the revenue from the spirit tax, 1,600,000 for receipts of the duties on beets, 3,800,000 for the income tax, and 380,000 for miscellaneous receipts. With a balance of 5,887,000 kronor carried over from the previous year and 1,850,000 kronor earned by the state bank, the total amount available is 97,007,000 kronor. The total expenditure, including 69,101,311 kronor of ordinary expenses, 16,406,389 kronor of extraordinary outlay, 10,495,000 kronor for interest and amortization of the debt, 250,000 kronor reserved for the construction of a hall for the Legislature, 100,000 kronor reserved for a working-men's accident insurance fund, is made to balance the estimate of receipts by carrying 654,300 kronor to floating capital. The ordinary expenditure on the army is 20,670,000 kronor; on the navy, 6,258,690 kronor; extraordinary expenditure on the army and navy, 4,315,910 kronor; expenditure on education and religion, 12,335,282 kronor; pensions, 2,915,550 kronor; cost of administration of the customs, post-office, excise, telegraphs, and forests, 16,340,066 kronor; civil list, 1,320,000 kronor; expenses of the judiciary, 3,854,107 kronor; expenses of diplomatic relations, 606,750 kronor; expenses of the Interior Department, 4,800,886 kronor; extraordinary expenditures, 12,090,479 kronor.

The public debt comprises an internal loan, paying 3-6 per cent. interest, raised in 1887, of

which 18,890,500 kronor were outstanding on Jan. 1, 1891, and 240,622,090 kronor borrowed in Great Britain, France, and Germany, of which 16,665,432 kronor raised in 1878 and 111,078,900 kronor raised in 1880 pay 4 per cent., 49,625,333 kronor remaining from the loan of 1886 and 35,555,556 kronor borrowed in 1890 pay 3½ per cent., and 26,666,667 kronor were raised at 3 per cent. in 1888.

The Army and Navy.—The larger part of the army consists of the *Indelta* or cantoned troops, which are raised and maintained by rural proprietors in virtue of contracts made with them by the Government. During the first year, which usually begins at the age of twenty, the recruits are kept with the colors one hundred and twenty days, except the cavalrymen, who are trained for two hundred and twenty days. In the second year the soldiers are required to exercise seventy-two days, and in the succeeding four years twenty-two days. The life guards, the engineers and train, the artillery, and bodies of hussars and chasseurs consist of enlisted troops, called the *Värfvade*, who are engaged for terms of active service varying from two to six years. Under the conscription law of Jan. 1, 1887, every Swede is enrolled for six years in the *Bevärung* and six years in the *Landstorm*, and during the first two years is drilled for a total period of forty-two days. The strength of the regular army in 1891 was 2,086 officers, 521 employés, 1,688 under officers, 1,593 musicians, and 33,783 privates, making 39,671 men, with 6,249 horses. The *Bevärung* numbered 134,717 of all ranks, and the *Landstorm* 159,763, making a total war effective of 334,151 men.

The Swedish navy in 1891 comprised 2 first-class, 4 second-class, and 10 third-class armor-clad gun-vessels, 15 sloop gunboats, 1 small cruiser, 6 first-class and 9 second-class torpedo boats, two school ships, 1 frigate, 3 corvettes, and 3 transports, besides 2 sailing corvettes and 4 brigs. The armament comprised 148 guns and 154 machine guns. The crews numbered 4,295 men. The most powerful ship is the "*Sren*," completed in 1886, a central citadel ironclad of 2,900 tons displacement, plated with 12 inches of armor over the vulnerable parts, and carrying a couple of 32-ton breech-loaders in her turret and 4 6-inch guns on the upper deck.

Commerce.—The total value of imports in 1889 was 376,964,000 kronor, against 324,769,000 kronor in 1888 and 297,410,000 kronor in 1887. The value of the exports was 301,725,000 kronor, against 281,753,000 kronor in 1888 and 246,678,000 kronor in 1887. Of the exports for 1889, the value of 1,448,000 kronor went to the United States. Of the value of the imports, 115,503,000 kronor were from Germany, 110,815,000 kronor from Great Britain, 45,239,000 kronor from Denmark, 34,311,000 kronor from Norway, 20,950,000 kronor from Russia, 12,185,000 kronor from Belgium, 8,960,000 kronor from the Netherlands, 7,636,000 kronor from France, 5,904,000 kronor from the United States, 5,815,000 kronor from Finland, 3,058,000 kronor from eastern Asia, and 6,588,000 kronor from other countries. The imports of articles of consumption were valued at 119,000,000 kronor, including 20,300,000 kronor for cereals, 50,800,000 kronor for colonial goods, 15,800,000 kronor for animals and animal

food products, 9,100,000 kronor for tobacco, 7,400,000 kronor for fermented drinks, 4,000,000 kronor for fruits and legumes, and 2,600,000 kronor for salt. The imports of articles of consumption amounted to 73,900,000 kronor, including 59,100,000 kronor for animals and animal victuals, 11,100,000 kronor for cereals, 2,000,000 kronor for spirits, and 1,700,000 kronor for other things. Imports of raw materials, 88,600,000 kronor in total value, consisted of textile materials for 27,000,000 kronor, coal for 26,200,000 kronor, hides and leather for 13,100,000 kronor, metals for 11,600,000 kronor, minerals for 8,800,000 kronor, and timber for 1,900,000 kronor. The exports of raw materials were 162,900,000 kronor in value, consisting of lumber for 116,700,000 kronor, metals for 40,000,000 kronor, minerals for 4,700,000 kronor, and other articles for 1,500,000 kronor. The imports of manufactured goods, 127,500,000 kronor in value, consisted of textiles for 76,200,000 kronor, ships, machinery, and vehicles for 18,200,000 kronor, metal wares for 15,000,000 kronor, paper for 5,000,000 kronor, and other goods for 13,100,000 kronor. The exports of manufactured products were 59,300,000 kronor in value, the principal items being paper for 17,700,000 kronor, textile manufactures for 7,700,000 kronor, and metal goods for 5,200,000 kronor. The imports of oils, drugs and chemicals, and other miscellaneous merchandise were valued at 41,500,000 kronor, and the exports at 5,500,000 kronor. The import of precious metals was 400,000 kronor and the export 100,000 kronor.

Navigation.—The number of vessels entered at Swedish ports during 1889 was 30,184, of 5,450,000 tons, of which 14,098, of 1,781,000 tons, were Swedish, 2,627, of 529,000 tons, were Norwegian, and 13,459, of 3,140,000 tons, were of other nationalities. Of the total number, 11,484, of 2,389,000 tons, were with cargoes. The number of steamers included in the total was 12,713, of 3,686,000 tons. The total number cleared was 28,027, of 5,181,000 tons, including 12,570 steamers, of 3,644,000 tons; of the total number, 19,164, of 3,888,000 tons, carried cargoes.

The merchant marine on Jan. 1, 1890, numbered 2,859 sailing vessels, of 369,709 tons, and 963 steamers, of 134,970 tons, a total of 3,822 vessels, of 504,679 tons.

Communications.—The Swedish railroads at the end of 1890 had a total length of 8,018 kilometres, of which 2,613 kilometres belonged to the Government and 5,405 kilometres to private companies. The cost of the state railroads up to the end of 1888 was 247,173,027 kronor, and of the private lines 247,842,457 kronor.

The total length of the state telegraph lines in 1890 was 8,785 kilometres, with 22,884 kilometres of wires, including 101 kilometres of submarine cable, but not the cable owned in common with Denmark, nor that running to the island of Rügen, of which the Prussian Government is joint owner. The number of paid messages sent in the internal service was 961,476; international messages, 603,517; in transit, 190,352; official, 65,331; receipts, 1,444,909 kronor; expenses, 1,359,161 kronor.

The number of letters mailed in 1889 was 41,808,000 in the internal service, 11,469,000 international, and 244,030 in transit; the number of

postal cards, 4,642,000 internal and 7,110,000 international; printed inclosures, 2,456,000 internal and 2,718,000 international; registered letters, 1,575,000 internal, with 604,396,000 francs, and 199 international, with 49,275,000 francs.

NORWAY.—The legislative body is the Storting, composed of 114 representatives, 38 from towns and 76 from rural constituencies, elected for three years by the suffrage of chosen electors. It meets every year for two months in February, and elects one fourth of its members to form the Lagthing, which approves or rejects the projects of law that have first passed the Odelsting, consisting of the other three fourths of the Storting. If the Lagthing withholds its assent to a measure, the two Houses meet in joint session and a two-thirds vote is necessary to make the bill a law. The Council of State in the beginning of 1891 was composed of the following members: Minister of State, Emil Stang; Education and Ecclesiastical Affairs, Jakob Aall Bonnevie; Justice, Ulrik Christian Arneberg; Interior, Ole Andreas Furu; Public Works, Peter Birch-Reichenwald; Finance and Customs, Evald Rygh; Defense, Col. Edvard Hans Hoff; Revision of Public Accounts, Emil Stang; Delegation at Stockholm, Gregers Winther Wulfsberg Gram, Ferdinand Nicolai Roll, and Johan Henrik Paasche Thorne.

Area and Population.—The area of Norway is 123,205 square miles. The population, according to the provisional returns of the census of Jan. 1, 1891, is 1,988,997, consisting of 1,037,501 males and 1,988,997 females. The urban population is 463,957, and the rural population 1,525,040. The number of marriages in 1889 was 12,416; of births, 59,188; of deaths, 34,704; excess of births, 24,484. Christiania, the capital, had 148,319 inhabitants present at the census of 1891; Bergen had 52,756; Trondhjem, 24,746; Stavanger, 22,478. The number of emigrants in 1890 was 10,991, against 12,642 in 1889.

Finances.—The ordinary receipts in the year ending June 30, 1891, were 49,804,900 kronor, of which 23,353,500 kronor were derived from customs, 3,041,800 kronor from the spirit duty, 2,104,300 kronor from the malt duty, 7,487,900 kronor from railroads, 1,498,900 kronor from domains, forests, and mines, 2,693,700 kronor from the post-office, 1,071,200 kronor from telegraphs, 1,971,600 kronor from capital, and the rest from succession duties, courts of justice, the university, stamps, etc. The total expenditures amounted to 45,398,200 kronor, the chief items being 9,283,200 kronor for public works, 8,107,100 kronor for financial administration and the debt, 7,424,200 kronor for the army, 5,811,200 kronor for the Interior Department, including the expenses of the post-office and telegraphs, 4,535,800 kronor for justice, police, and sanitary supervision, and 4,373,100 kronor for education. The debt, which was contracted for reproductive works, amounted on June 30, 1890, to 115,357,500 kronor, and was offset by the value of the railroads and other quick assets reckoned at 139,312,900 kronor.

Commerce.—The total value of the imports in 1890 was 208,659,000 kronor, against 191,608,000 kronor in 1889, and 158,397,000 kronor in 1888. The total exports were valued at 131,096,000 kronor, against 132,669,000 kronor in 1889 and 122,357,000 kronor in 1888. Of the im-

ports, Great Britain furnished the value of 66,128,000 kroner; Germany, 54,985,000 kroner; Sweden, 23,125,000 kroner; Russia and Finland, 20,726,000 kroner; Denmark, 9,378,000 kroner; the United States, 9,203,000 kroner; the Netherlands, 8,054,000 kroner; Belgium, 6,520,000 kroner; France, 5,833,000 kroner; and other countries, 4,706,000 kroner. Of the total exports, 42,250,000 kroner went to Great Britain, 19,631,000 kroner to Sweden, 18,227,000 kroner to Germany, 11,974,000 kroner to Spain, 7,087,000 kroner to France, 6,223,000 kroner to Holland, 5,329,000 kroner to Belgium, 5,300,000 kroner to Denmark, 4,372,000 kroner to Italy, 3,095,000 kroner to Russia and Finland, 2,094,000 kroner to the United States, and 5,518,000 kroner to other countries. The imports of articles of food and drink amounted to 79,000,000 kroner, the principal items being 33,600,000 kroner for cereals, 23,200,000 kroner for colonial products, 15,600,000 kroner for animals and animal products, and 3,800,000 kroner for fermented liquors. The exports in the same class amounted to 49,300,000 kroner, of which 46,300,000 kroner represent animal products. The imports of raw materials of the total value of 42,300,000 kroner were coal of the value of 11,500,000 kroner, metals next of the value of 8,100,000 kroner, then textile materials for 7,700,000 kroner, and after these hides and leather for 6,600,000 kroner, minerals for 4,600,000 kroner, and lumber for 3,800,000 kroner. Lumber constitutes 76 per cent. of the exports of raw materials, 31,000,000 out of a total value of 44,000,000 kroner, hides and skins of the value of 7,900,000 kroner coming next, and then mineral substances of the value of 3,200,000 kroner. The imports of manufactured goods of the total value of 45,700,000 kroner include textile fabrics to the amount of 30,200,000 kroner, metal wares for 7,900,000 kroner, and manufactures of wood, paper, and leather of the value of 5,600,000 kroner. The imports of miscellaneous merchandise amounted to 43,700,000 kroner, and the exports to 12,900,000 kroner, including oil of the value of 7,600,000 kroner.

Navigation.—The number of vessels entered at ports of Norway in 1889 was 13,064, of 2,705,293 tons, of which 7,229, of 1,719,083 tons were Norwegian. There were cleared 12,854 in all, of 2,629,177 tons, and of these, 7,027, of 1,649,168 tons, were Norwegian. Of the ships entered, 5,845, of 1,572,814 tons, were with cargoes, and 7,219, of 1,132,479 tons, in ballast; and of those cleared, 11,728, of 2,223,596 tons, were with cargoes, and 1,126, of 405,581 tons, in ballast.

The merchant navy on Jan. 1, 1890, consisted of 7,285 ships, of 1,611,398 tons, as compared with 7,233, of 1,534,540 tons, in 1889. The steam fleet numbered 592 vessels in 1889, of 168,081 tons, not counting the vessels of the Government.

Communications.—The railroads in 1891 had a total length of 1,562 kilometres. The Government lines of telegraph had a length in 1890 of 7,585 kilometres, with 14,530 kilometres of wire, and the telegraphs belonging to railroads had a length of 1,585 kilometres, with 2,645 kilometres of wire. There were sent in that year 930,005 internal, 523,927 international, and 8,392 official dispatches. The receipts were 1,095,521 kroner and the expenses 1,149,280.

The number of domestic letters that went through the post-office during 1890 was 19,841,000, besides 1,488,400 registered money letters, and the number of printed inclosures was 23,471,400. The number of foreign letters was 7,407,400; of registered letters, 86,900; of news-papers, etc., 1,080,000. The postal receipts were 2,818,575 kroner, and the expenses 2,615,684.

The Army and Navy.—Military service is obligatory by law, and the period, beginning at the age of twenty-three, is thirteen years, viz.: five in the active army, four in the *Landwehr*, and four in the *Landsturm*. Actual service is restricted to a course of instruction in the first year lasting forty-two days for the infantry and fortress artillery, fifty days for the engineers, and seventy days for the cavalry and field artillery, which is followed by twelve days of exercises with the first class of the *Landwehr*, and to twenty-four days of training in each of the two succeeding years. The effective of the active army is about 12,000 men, and in case of war it may be raised to 800 officers and 18,000 men; but this number must not be exceeded without the consent of the Storting. The military efficiency of the Norwegians has been improved by more careful instruction and voluntary practice in recent years.

The naval forces consist of 4 monitors carrying eight cannons, a deck-protected corvette armed with 16 guns, a smaller corvette armed with 12 guns, 3 large gunboats, 11 of the intermediate class, 17 small ones, and 9 torpedo boats, making 48 steamers mounting 82 cannons, besides 88 machine guns.

Political Crisis.—On Feb. 23, 1891, M. Berner, a member of the Liberal Opposition, proposed in the Storting a resolution demanding greater independence for Norway in diplomatic relations. The Government opposed the resolution, but by a coalition of a part of the Moderate Liberals with the Radicals it was carried by 59 votes against 55. This motion gave expression to one of the principal demands of the Norwegian people, for which Björnstjerne Björnson and other champions of Norwegian liberty and progress have agitated for years, and which has been upheld by the vote of the people, but delayed and defeated through the timidity and vacillation of politicians. The advocates of this and the other demands of the Radical party, which came into power when Johan Sverdrup was made Prime Minister in June, 1884, are believers in popular sovereignty, many of them are avowed Republicans, and the reforms called for by the Norwegian people, which would give proper weight to their interests in international relations, excited such antagonism in Sweden and among the Monarchists and friends of the Union in Norway, who regarded them as a preliminary step that would eventually lead to the dissolution of the Union and the proclamation of a republic, that the Moderate Liberals obtained the upper hand in the Sverdrup government. This caused a split in the Liberal party, which resulted in the formation of a ministry on July 12, 1889, by Emil Stang, leader of the Constitutional or Conservative party, who has been supported by the Moderate Liberals in keeping back the question of independent consular and diplomatic representation, which threatened to

bring on a collision with the crown. The Radical party in Sweden has sympathized with the Norwegians in this matter. All diplomatic intercourse is conducted by the Swedish Minister of Foreign Affairs, who is expected to consult the delegation at Stockholm of the Norwegian Council. Nearly all diplomatic posts abroad, and even the consulships, are filled by Swedes. The first demand of the Norwegians, that they should be represented more equally in the consular service because their commercial relations are more extended and their mercantile navy three times as large as that of Sweden, was disregarded. The officials at Stockholm held that Norwegians are generally unfitted by their political associations and lack of training to represent the Government abroad with dignity and efficiency. Minister Stang arranged a compromise with the Swedish Government, which promised at last to give Norwegians a larger proportion of the offices. When defeated on this question by a majority of 4 in a full Storthing, he resigned. The King, on his advice, sent for the mover of the resolution, but M. Berner declined, recommending that either the question should be deferred a little longer by the formation of a cabinet of affairs, or that M. Steen, rector of the gymnasium at Stavanger, who is the leader of the Pure Left, should be intrusted with the management of the business. The latter course was adopted on the advice of the retiring ministers. M. Steen accepted the task of forming a ministry, with the understanding that proposals for the modification of the Act of Union of 1814, and other important reforms, should not be brought forward until it could be seen by the results of the general election in December, 1891, whether the country approved the Radical programme. He completed the list on March 4, refusing to admit any representatives of the Moderate Liberals, although he would be obliged to depend on their votes for the conduct of all public business, for they numbered 23 in the Storthing, and the Pure Left 38, while the Conservatives held 53 seats. The portfolios were assigned as follows: J. C. W. Steen, Minister of State and Chief of the Department of Finance and Customs; H. H. T. Nyom, Chief of the Department of Public Works and of that of Revision of Accounts *ad interim*; V. A. Wexelsen, Worship and Public Instruction; O. A. Qvam, Justice and Police; Lieut.-Col. O. F. Holst, National Defense; W. Konow, Interior; Minister of State at Stockholm, O. A. Blehr; Councilors in the section sitting at Stockholm, C. Berner and J. O. Lange.

The Radical or National party, which was strengthened by the preliminary elections during the year, added to its programme the question of extension of the suffrage, which has been opposed by the hitherto dominant Agrarian party. When the elections were concluded the Radicals had gained the absolute majority.

Congress on the Punishment of Crime.—The third congress of the International Association for the Consideration of Questions relating to Crimes and Criminals was held in Christiania in August. It passed a resolution recommending the imposition of money fines in many cases as a substitute for imprisonment or more violent penalties. It was recommended further that, in

assessing the fines, courts should adjust them to the pecuniary means of offenders, fixing the maximum very high and the minimum low; that the fines should be made payable in installments, if the prisoners were unable to pay them at once; and that, when sentenced to imprisonment, a prisoner should have the option of paying a fine as a means of reducing the term. The congress disapproved the proposition to convert sentences into imprisonment in cases where criminals were too poor to pay their fines.

SWITZERLAND, a federal republic in central Europe. The perpetual neutrality of Switzerland and the integrity and inviolability of her territory were guaranteed by Austria, Great Britain, Portugal, Prussia, and Russia in November, 1815. The Constitution adopted after the war of the Sonderbund in 1848 created two legislative chambers—the National Assembly, representing the Swiss people as a whole, and the Council of States, representing the cantons—and vested the executive authority in a Federal Council of 7 members. Switzerland thus was transformed from a league of republics into a federal republic; and a further centralization was brought about by the unification of the army and the laws when the Constitution was revised in 1874. The Council of States, or Ständerath, has two members from each of the 22 cantons, each independent part of the divided cantons of Basel, Appenzell, and Unterwald sending 1 member. The Nationalrath, or National Council, contains 147 representatives of the nation, chosen by universal suffrage in the proportion of 1 to every 20,000 inhabitants. Although the two bodies have equal and concurrent powers, the popular body has come to be the more important. Sitting together, the two chambers form the United Federal Assembly, which elects the Federal Council and the Federal Tribunal. In debate each representative uses his own language, German, French, or Italian. In 1891 a bill was passed ordering official reports of the legislative proceedings to be printed in the future. The Federal Council is elected by the Federal Assembly or Bundesversammlung for three years. No two men from one canton can be members of the same Council, and when Deputies are elected their seats in the chambers become vacant. The attributes of the Council are to enforce the provisions of the Federal Constitution, to execute the acts of the Assembly and of the Tribunal, to administer the finances, to examine laws passed by the cantonal governments and to settle disputes arising between them, and see that they fulfill their obligations toward the Confederation. Except in foreign affairs their duties are chiefly ministerial, yet in shaping legislation they exercise great influence both individually and as a body. Each member of the Council presides over one of the executive departments. The president of the Confederation is one of the members of the Council, who is elected by his colleagues for one year to the position, which is now simply titular, for it no longer gives the incumbent the charge of the most important department of the Government.

The communes of Switzerland preserve in a large degree their ancient autonomy. The Federal Constitution is a counterpart of the main features of the political organization of the indi-

vidual cantons, which possess a degree of sovereignty equal to that of the American States, having complete control and legislative power regarding personal rights, land laws, administration of criminal justice, the cantonal and communal police, organization of communes, public works, and elementary education.

The Federal Council for 1890-'92 is composed of the following members: President of the Confederation for 1891, Dr. E. Welti, of Aargau, chief of the Department of Posts and Railroads; Vice-President for 1891, W. Hauser, of Zürich, chief of the Department of Finance and Customs; Dr. K. Schenk, of Bern, chief of the Department of the Interior; L. Ruchonnet, of Vaud, chief of the Department of Justice and Police; Dr. N. Droz, of Neuchâtel, chief of the Department of Foreign Affairs; Dr. A. Deucher, of Thurgau, chief of the Department of Industry and Agriculture; Col. E. Frey, of the rural division of Basel, chief of the Department of Military Affairs. Dr. Welti retired from the Bundesrath in December, 1891, and in his place was chosen Dr. Zemp, of Luzern, the first member of the Conservative Ultramontane party who had ever been President of the National Council and the first to enter the Federal Council.

Area and Population.—The area of Switzerland is 41,346 square kilometres, or 15,892 square miles. The domiciled population, as ascertained by the census of Dec. 31, 1888, was 2,917,754, and the population present was 2,933,334, showing an increase of 0.375 per cent. per annum since the census of 1880. According to the preliminary returns regarding sex there were 1,427,057 males and 1,506,277 females. The number of Swiss in the resident population was 2,688,104; the number of foreigners was 229,650, of whom 112,342 were Germans, 53,627 French, 41,881 Italians, 14,181 Austrians and Hungarians, 3,577 British, 1,354 Russians, 2,153 from other European countries, 1,019 North Americans, and 516 from other countries. In religion, 1,716,548, or 58.8 per cent. of the population, were Protestants; 1,183,828, or 40.6 per cent., were Catholics; 8,069 were Jews; and 9,309 were of other beliefs. In regard to language, 2,083,097 spoke German, 634,613 French, 155,130 Italian, 38,357 Romansch, and 6,557 other tongues. The Italian and Romansch languages are losing ground gradually, and the French-speaking population is increasing at the expense of the German, through the assimilation of the German-Swiss element. The number of marriages in 1890 was 20,836; births, 81,620; deaths, 64,877; natural increase of population, 16,743. The transmarine emigration in 1890 was 7,712, of which number 6,917 were destined for North America, 752 for South America, and 43 for other parts of the world. The population of the chief cities in 1888 was as follows: Zürich, 90,088; Geneva, 71,807; Basel, 69,809; Bern, the seat of the Federal Government, 46,009; Lausanne, the seat of the Federal Tribunal, 33,340; St. Gallen, 27,390; La Chaux-de-Fonds, 25,603. Education is compulsory and almost universal in the Protestant cantons. Only 0.11 per cent. of the recruits for the army were found illiterate in 1888. The students in the universities of Bern, Zürich, Basel, and Geneva, and the academies of Lausanne and Neuchâtel, numbered 2,412 in 1889, of

whom 630 were foreigners and 196 were females, and at the National Polytechnic School there were 970 studying in 1888. There were 461,622 children and 245,525 adults receiving instruction in the elementary schools in 1886, and 136,552 pupils in the work schools for girls.

Finances.—The receipts of the Federal Government for 1890 were 73,153,889 francs, of which 31,258,296 francs were from customs, 24,180,020 francs from the post-office, 4,309,938 francs from telegraphs and telephones, 8,499,796 from the military arsenals, workshops, and army-exemption tax, 1,317,837 francs from invested capital, and small sums from other sources. The total expenditure was 72,221,019 francs, of which 27,111,079 francs were for the army, 21,908,658 francs for the post-office, 3,266,834 francs for the telegraph service, 6,449,952 francs for administering the finances and customs, 7,391,041 francs for the Interior Department, 2,652,373 francs for the public debt, and smaller amounts for other purposes.

The Federal debt on Jan. 1, 1891, amounted to 58,412,452 francs, against which the Government could show general assets amounting to 92,625,710 francs and 14,500,667 francs held in special funds.

Commerce.—The value of the special imports in 1890 was 953,395,000 francs, of which 295,140,000 francs came from Germany, 226,341,000 francs from France, 129,015,000 francs from Italy, 102,320,000 francs from Austria-Hungary, 52,374,000 francs from Great Britain; 33,292,000 francs from Russia, 31,838,000 francs from Belgium, 28,734,000 francs from the United States, 14,946,000 francs from Africa, 8,894,000 francs from Holland, 15,210,000 francs from other European countries, 7,076,000 francs from other countries of America besides the United States, 7,076,000 francs from Asia, and 1,964,000 francs from Australia and Polynesia. The total value of the exports was 703,540,000 francs, of which 181,873,000 francs represent the exports to Germany, 123,929,000 francs went to France, 106,489,000 francs to Great Britain, 82,676,000 francs to the United States, 50,370,000 francs to Italy, 39,259,000 francs to Austria-Hungary, 13,686,000 francs to Russia in Europe and Asia, 12,348,000 francs to Belgium, 4,834,000 francs to Holland. The total imports of grain and flour were 101,014,000 francs in value; spun silk, 73,509,000 francs; raw silk, 53,779,000 francs; animals, 61,006,000 francs; cotton, 43,562,000 francs; woolen thread and cloth, 43,031,000 francs; wine, 34,595,000 francs; coal, 34,210,000 francs; cottons, 27,526,000 francs; apparel, 27,050,000 francs; iron, 26,418,000 francs; machinery and carriages, 20,462,000 francs; chemicals, 20,035,000 francs; sugar, 19,653,000 francs; coffee, 19,239,000 francs; iron and steel goods, 16,617,000 francs; silk manufactures, 13,953,000 francs; raw wool, 13,851,000 francs; timber, 12,899,000 francs; leather, 11,414,000 francs; manufactures of leather, 10,197,000 francs. The chief exports in 1890 were cotton goods of the value of 135,765,000 francs; silk manufactures, 121,031,000 francs; watches, 104,067,000 francs; silk thread, 65,948,000 francs; cheese, 38,207,000 francs; machinery and carriages, 23,882,000 francs; cotton, 22,397,000 francs; animals, 16,236,000 francs; raw silk, 12,

312,000 francs; milk, 13,449,000 francs; coloring matters, 10,921,000 francs; wool, 10,637,000 francs; apparel, 10,606,000 francs; hides and skins, 7,874,000 francs. Of the exports, 14·8 per cent. were pastoral and 85·2 per cent. industrial products, while of the imports 33·1 per cent. were agricultural, 20·1 per cent. pastoral, 1·9 per cent. forestry, 8·7 per cent. mining, and 36·2 per cent. industrial products.

Railroads.—The Swiss railroads on July 1, 1890, had a total length of 3,156 kilometres, including the St. Gothard line. They were owned by about 15 companies, with the exception of the Jura and Luzern line, passing through Bern, which belongs to the canton of Bern. The cost of construction up to the end of 1889 was 929,309,727 francs. The receipts for 1888 were 82,283,477 francs, and the expenses 43,850,883 francs. The Federal Government adopted the policy of obtaining possession of the railroads, and made terms for the purchase of the Swiss Central line, which were approved by the Assembly but rejected by the people in December, 1891.

Posts and Telegraphs.—The post-office in 1890 forwarded 76,497,000 domestic and 33,693,000 international letters, and 20,292,000 domestic and 15,259,000 foreign circulars, and transmitted in 3,019,000 domestic postal orders 345,416,000 francs, and in 682,000 foreign orders 39,972,000 francs.

The state telegraph lines had in 1890 a total length of 7,200 kilometres, with 18,238 kilometres of wire. The number of dispatches for the year was 3,824,040, of which 1,965,862 were internal, 1,219,653 international, 510,473 in transit, and 128,052 connected with the service. The receipts were 4,309,933 francs, and the expenses 3,909,859 francs.

The Army.—Every Swiss citizen, whether he resides at home or abroad, must perform military service or pay an exemption tax. The battalions are always kept up to their full strength, and progress is made constantly in order to enable the republic to defend at need its neutrality. The *Auszug*, or regular army, numbered 1,238 staff and furloughed officers, 1,826 sanitary troops, 1,190 administrative troops, 106 battalions of infantry numbering 97,721 officers and men, 48 squadrons of cavalry and 12 companies of scouts numbering 3,004 officers and men, 60 batteries of artillery numbering, with train, park, and artillery of position, 18,032 officers and men, and 24 companies of engineers numbering 4,962 officers and men, making in all 127,973 men. The *Landwehr* is organized likewise in 106 battalions and 24 squadrons, and duplicates the formations of mountain and fortress artillery, park, train, and engineers, but has only 8 instead of 48 field batteries. The numerical strength is returned as 80,272 men, making a war effective of 208,245, not counting the newly organized *Landsturm*, which is estimated at 300,000 men.

The Referendum and Legislative Initiative.—The *referendum*, as established in Switzerland, is the reference to the whole body of voters, whether of the Confederation or of one of the cantons, of enactments of their legislative bodies for their acceptance or rejection. The *referendum* is either compulsory or optional. It is compulsory where the Constitution of a canton requires that the legislative work of the Grand

Council shall be submitted to the people for ratification. In other cantons a certain number of electors can demand that an act of the cantonal Legislature shall be voted on by the whole electorate, and on receiving their petition the cantonal Government must lay it before the people. Optional *referendum* was established for the Confederation in 1848 in regard to revisions of the Constitution, and in 1874 it was extended to other legislation. The Federal Chambers may call for a popular vote on any measure that they have passed, and a measure must be submitted to the people for confirmation or nullification when 30,000 citizens sign a call for the *referendum*. A large proportion of the important bills passed by the Chambers in recent years have been vetoed by the people. In some instances the motives for defeating the measures of the Federal Assembly are not found solely in the provisions of the bill that is attacked. The Ultramontanes, who represent the bulk of the Roman Catholics, constituting 40 per cent. of the entire population, are interested in discrediting and upsetting the acts of the Assembly because the Radical majority has persistently disregarded their protests and pursued an aggressive policy toward the Church. The Protestant Conservatives, who have also felt the effects of the policy of secularization, have been the allies of the Catholic clericals. The Radicals, although still in the majority, are less powerful than formerly. They have been compelled to make peace with the Church by undoing some acts committed by the Government during the heat of the religious struggle. The religious question has given way to social and political movements, and the young democracy, constituting the Extreme Left of the Chamber, are attracting many Radicals into their ranks. Their platform is that of social reform, and they are in favor of direct legislation by the people. The Liberal Conservatives, representing the capitalist class, form a small group in the Chamber, though their power is felt in the country. The young Democrats have been inclined to form an alliance with the Ultramontanes. The latest demand of the latter is that they should be represented in the Federal Council, in which they have never held a seat, notwithstanding their numerical strength in the Assembly. The Catholic cantons took the lead in demanding the *referendum* for a bill granting retiring pensions to employés in the post-office and other branches of the civil service. The young Democrats joined in opposing the bill, which was annulled in the beginning of April, 1891, by the crushing popular majority of 352,000 to 94,000 votes. The blow was the more severe for the men now in power because the opposition was not directed against the principle of the civil pensions, but against provisions of the bill giving the authorities discretionary power to grant or withhold them. Many Swiss statesmen are in favor of introducing the compulsory *referendum* at once as a simpler and less troublesome procedure, since the optional *referendum* has come to be so frequently exercised.

On July 5, 1891, the Swiss people by a general vote carried the principle of direct democratic government still further by adopting a constitutional amendment establishing the popular initia-

tive in legislation on constitutional subjects. The principle of initiating proposals had already been introduced in several of the cantons. Under the new law, when 50,000 citizens unite in the demand, the Chambers must take up any legislative proposals and frame a bill on the subject; or, if the bill is formulated and presented in the call, the Chambers are compelled to accept it and place it before the people for their agreement or disapproval. The amendment was supported by the Ultramontanes and Democrats and by the Liberals of Neuchâtel and Geneva and the Conservative Protestants. The clerical parties hope to arrest the prevailing tendency toward centralization by means of it, and even to force the repeal of certain laws obnoxious to their religious and political convictions. The young Democrats, who are strong centralists, expect to reach their goal more rapidly through the popular initiative, and to effect their cherished social reforms through its instrumentality. The popular vote on the amendment was 169,142 in favor of the people's right to take the initiative in demanding a revision of the provisions of the Constitution to 117,338 against it, a majority in the negative being recorded in only four cantons.

The Ticino Revolt.—When the Radicals of the canton of Ticino, in 1890, overthrew by force the Ultramontane government of the canton, took possession of the palace, and established a provisional government, the Federal authorities sent a commissioner and two battalions of infantry to restore order, but did not use their powers to immediately reinstate the constitutional government. The revolutionists agreed to accept the decision of the majority in the popular elections. The Radicals abstained from voting, and the Constitutional Assembly, which met in January, 1891, was composed entirely of Conservatives. The Constitution was amended in the interest of the Ultramontanes, and on March 8 the people voted on the revised Constitution, which was approved by a majority of only 350 out of 21,000 votes. In July, 21 persons who had taken part in the revolt were tried before a jury in Zürich, the venue having been transferred to that place on account of the excited state of feeling in Ticino. All the accused were acquitted. The trial of Castioni on the charge of having shot State Councilor Rossi ended in his condemnation *in contumaciam* to eight years of hard labor and deprivation of civil rights, as he failed to appear, having fled to England. In September the cantonal government decided to grant an amnesty to the other persons connected with the revolt.

Commercial Treaty with Germany.—A treaty of commerce was concluded with Germany at Vienna on Dec. 10, 1891, which enters into force on Feb. 1, 1892, and expires on Dec. 31, 1903, and from year to year thereafter by tacit consent. Each Government guarantees to the citizens of the other every advantage, privilege, or reduction granted to the citizens of any other country, and will not apply any prohibition or restriction of imports or exports that is not enforced against all other nations, nor in any case forbid the export of grain, cattle, or fuel. Conventional duties are fixed for long lists of articles of German and of Swiss origin or manufacture, and on these no transit duties may be

levied. Articles sent from one country to fairs and markets in the other, samples, empty sacks and barrels, and unsold cattle sent to markets across the frontier, or cattle fattened or pastured in the customs territory of the other contracting party, pay no duty, if they are returned to the country of their origin. Partly manufactured goods and materials, when sent from one country to the other for the completion of the manufacture or for finishing or improving processes, are subject to no duty when returned in the completed or improved form. Thus, textile goods and yarns exported for the purpose of being washed, bleached, colored, printed, etc., the materials for embroideries, laces, trimmings, etc., silk for dyeing, leather and pelts for the manufacture of leather goods and furs, articles sent to be painted, varnished, or polished, and all articles the essential character and names of which are not altered by the improving process, are free from duty both ways. Imports from either country must not be subjected to local or internal taxes higher than are imposed on domestic products of the same nature. Merchants and manufacturers of either country, and their traveling agents, shall be free to circulate and to solicit orders.

Congress on Accident to Workmen.—An International Congress on Accidents to Workmen was held in Bern, in September, 1891. Germany, Great Britain, Austria, Belgium, the United States, Italy, the Netherlands, Russia, Spain, Sweden and Norway, and Switzerland, were represented by more than 300 delegates, many of whom were officials and representatives of their Governments, although the congress had no official character. Labor experts and delegates of employers' associations were present, but working-men's associations were not represented. The first congress of the kind met in Paris in 1889. This was the second one, and a resolution was passed to appoint a permanent committee and hold meetings at intervals of two or three years. The congress lasted a week, and ended on Sept. 26, with the passing of a general resolution to the following effect:

1. The congress and its executive shall in future be called "The Congress and Permanent Committee concerning Accidents to Workmen, and Social Insurance."

2. It is the imperative duty of our time to guard against accidents to workmen and illnesses incidental to particular occupations by adopting the necessary preventive measures, and to compensate those suffering from such accidents and illnesses. In giving effect to these preventive measures, private initiative should co-operate with the action of trade associations and of the state. The indemnification of sufferers should be secured by means of insurance, and it is expedient that insurance against slight accidents and insurance against sickness should go together. In countries where insurance against infirmity and old age exists, it is advantageous to combine therewith insurance against serious accidents and illnesses arising from unhealthy occupations.

3. The congress deems it desirable that governments should, in a systematic manner, institute inquiries concerning accidents to workmen, and it instructs the permanent committee to draft a scheme for the preparation of an international statistical report, and to submit recommendations on the subject to the next congress, to be held, at the earliest, two years, at the latest four years, hence, the time and place of meeting to be fixed by the permanent committee.

T

TEMPERANCE INSTRUCTION IN PUBLIC SCHOOLS. Scientific temperance instruction in the United States has had a remarkable history, of which the outlines are given in the following passages from the Report of 1890 by Mrs. Mary H. Hunt, Superintendent of the work in the National and World's Woman's Christian Temperance Union:

Twelve years ago this department was created. Scientific temperance instruction in the public schools was then only an idea. People said, "It is a good thing, and ought to be done if it is possible." Scientific temperance instruction is required by the legislatures of thirty-five States—in fact, by every State in the republic save nine, in all the Territories, and in every school under the control of our national Government. Twelve years ago there was here and there a little sporadic temperance teaching by order of local school boards. To-day it is not a question of option with school boards. There are between 12,000,000 and 13,000,000 children of whom the law says they shall be taught the truth against strong drink and kindred narcotics. Twelve years ago there was no adequate well-graded school literature on this topic. To-day there is as large a variety of good school text-books on physiological or scientific temperance, issued by as many different publishers, as there are good school text-books on any other subject; and these books are as well graded to the capacities of all classes of pupils as are the best modern school readers. Twelve years ago there was no plan for a course of study in this branch. To-day we have schedules of as carefully graded courses of study for this as for any other science. Twelve years ago there was nothing like a uniform idea of what should constitute a faithful pursuit of this branch. To-day we have an established standard, signed by many of the most eminent educators in the land, as to what constitutes an honest pursuit of this study by all pupils in all schools as the law demands. Twelve years ago the Department of Scientific Temperance Instruction consisted of the National Superintendent and Mrs. C. C. Alford, secretary, and that was all. To-day it has a State or Territorial Superintendent pushing its interests in every State and Territory of the land, with county superintendents in every county in some States, with local superintendents in cities, towns, villages, hamlets, and, in some instances, in every school district in a county; and plans are being rapidly executed for completing the appointment of these for every school district in the land.

Mrs. Hunt, the person destined to lead this movement, was born in Canaan, Conn. Her father, Ephraim Hanchett, was a vice-president of the first temperance society in America. She was graduated at Patapsco Female Institute, Md., to which institution she returned as Professor of Natural Sciences. Her marriage to a Massachusetts manufacturer led to her residence in that State. In giving practical oversight to the scientific education of her son, a student in the Massachusetts Institute of Technology, Boston, from 1872 to 1876, Mrs. Hunt was led from the study of alcohol as a chemical reagent to an investigation as to its origin, nature, and effects upon the human system. She became a close student of the original investigations of Dr. B. W. Richardson, London, England, and the findings of others on all sides of the question. Convinced that popular misapprehension as to the

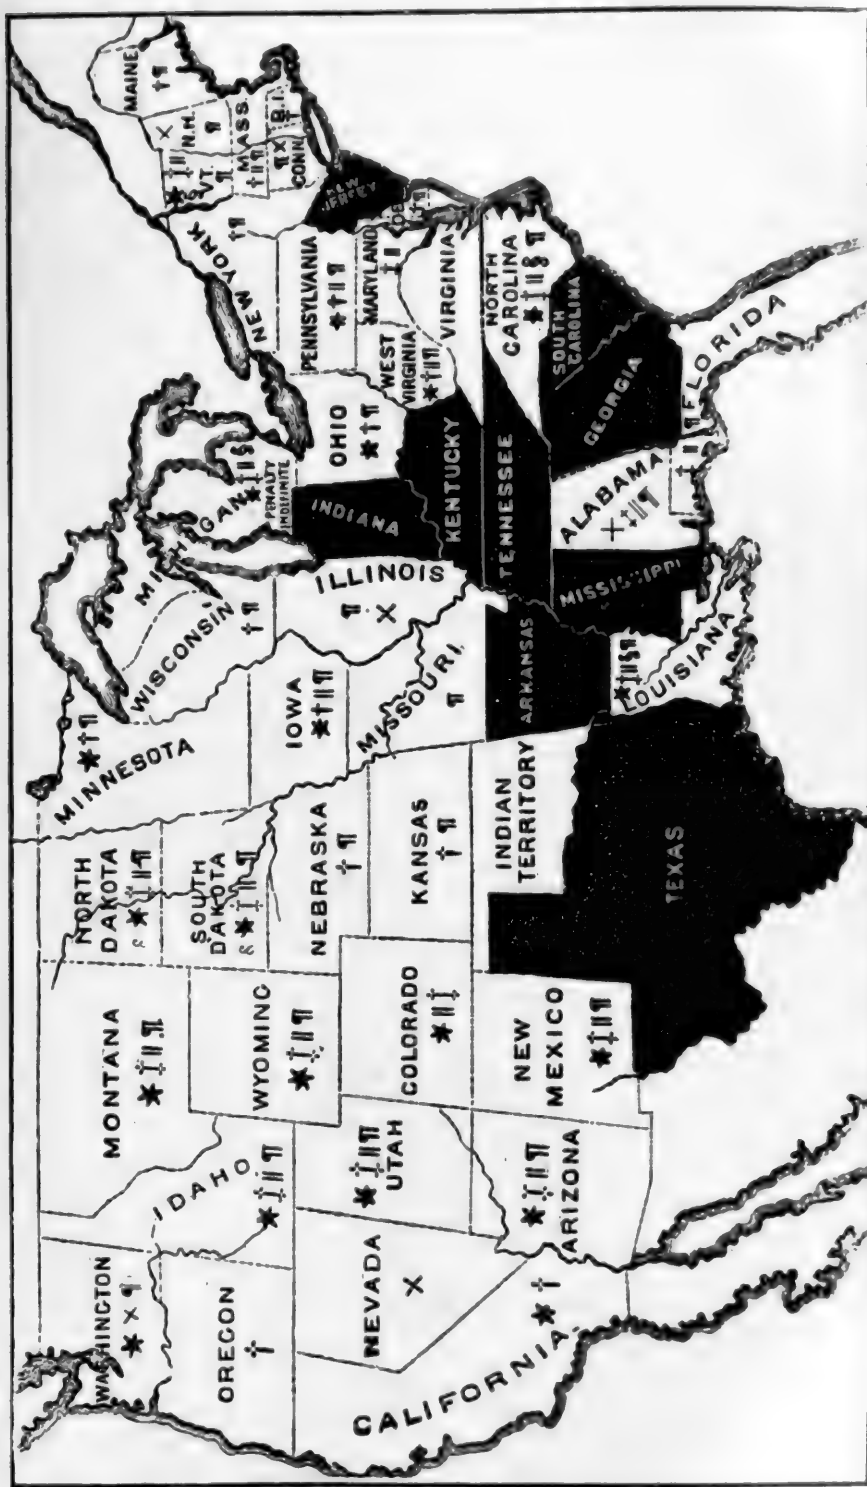

dangerous character of alcohol in small quantities, and ignorance of the fact that a little has the power to create an uncontrollable appetite for more, Mrs. Hunt came to the conclusion that universal early education on the subject before appetite is formed would solve the problem; and that, to be permanent as well as universal, such education should be a part of the public-school system of the country. Her first writings on the subject were a series of papers entitled "The School-house to decide the Temperance Question," published in the "New England Journal of Education," and subsequently circulated in pamphlet form. In 1878 the local School Board of Hyde Park, Mass. (her place of residence), formally adopted the study as a regular branch—the first instance of this kind, as far as known. In 1879 she presented her scheme of the study of physiological temperance in the public schools to the Woman's Christian Temperance Union, at its national convention at Indianapolis. In 1880 that society, responding to her request, created the Department of Scientific Temperance in Public Schools, making her its superintendent, and Mrs. C. C. Alford, of Brooklyn, N. Y., its secretary.

The first two years were given to organizing the department, with State, Territorial, county, and local superintendents; to agitation through the press and from the platform. Before attempting to secure legislation, Mrs. Hunt, foreseeing the need of some concise official answer to the objection that "medical science is not agreed on that topic," went before the American Medical Association, at their annual meeting in June, 1882, and asked for an expression as to the nature and effects of alcoholic drinks. In response they passed a series of resolutions, declaring:

1. We believe alcohol should be classed with other powerful drugs.
2. We are of the opinion that the use of alcoholic liquors as a beverage is productive of a large amount of physical and mental disease; that it entails diseased appetites and enfeebled constitutions upon offspring; and that it is the cause of a large percentage of the crime and pauperism in our cities and country.
3. We would welcome any change in public sentiment that would confine the use of liquors to the uses of science, art, and medicine.

Armed with this declaration, she began her legislative work. In October, 1882, she presented her first temperance educational bill to the Legislature of Vermont. Her thorough canvass of the State just prior to the meeting of the Legislature had roused the people in its behalf, and the bill passed with little or no opposition. It provided that "physiology and hygiene, with special reference to the effects of alcoholic drinks and other narcotics upon the human system, shall be taught in the public schools," and for the examination of teachers on the subject.

In 1883, co-operating with the Woman's Christian Temperance Unions of those States, she canvassed Michigan and New Hampshire, prior to the meeting of their legislatures, for compulsory temperance education in the public schools,

TEMPERANCE-EDUCATION MAP OF THE UNITED STATES AND TERRITORIES.
States in white have a Temperance-education Law; those in black have not.

and went to Lansing, drafted the bill, and addressed the Committee on Education and a joint session of the Legislature in its behalf. The bill provided, in addition to the requirements of the Vermont law, that the study should be taught "all pupils in all schools." Both this and the New Hampshire bill become laws, to take effect one year from their passage. Mrs. Hunt then said, "If we can carry New York and Pennsylvania for this legislation, we can carry the country by force of their example," and to the constituencies of the New York legislators she and her co-laborers went. Letters and petitions addressed to the Legislature and visiting committees followed, until a majority of the members were instructed from home to vote for the temperance education bill. It passed on March 4, 1884, in exactly the form in which it had been presented to both House and Senate, as follows:

1. Provision shall be made by the proper local school authorities for instructing all pupils, in all schools supported by public money or under State control, in physiology and hygiene, with special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system.

2. No certificate shall be granted any person to teach in the public schools of the State of New York after the first day of January, 1885, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system.

The Legislature of Rhode Island a few weeks later enacted a similar law. The Pennsylvania campaign of 1885 was one of the most extended and memorable. The State had been thoroughly organized for the work the year before, and now the subject was presented to the people back of nearly every legislator. In addition to this canvass of the State, Mrs. Hunt addressed a joint session of the House and Senate in behalf of the bill. The opposition roused by its stringent features was overcome as their need was set forth, and it passed the Senate unanimously and the House by a good majority. The Pennsylvania law provides:

That physiology and hygiene—which shall, in each division of the subject so pursued, include special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system—shall be included in the branches of study now required by law to be taught in the common schools, and shall be introduced and studied as a regular branch by all pupils in all departments of the public schools of the Commonwealth, and in all educational institutions supported, wholly or in part, by money from the Commonwealth.

It shall be the duty of county, city, and borough superintendents, and boards of all educational institutions receiving aid from the Commonwealth, to report to the Superintendent of Public Instruction any failure or neglect on the part of boards of school directors, boards of school controllers, boards of education, and boards of all educational institutions receiving aid from the Commonwealth, to make proper provision, in any and all of the schools or districts under their jurisdiction, for instruction in physiology and hygiene which, in each division of the subject so pursued, gives special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system, as required by this act; and such failure on the part of directors, controllers, boards of education, and boards of educational institutions receiving money from the Commonwealth, thus reported or otherwise satisfactorily proved, shall be deemed

sufficient cause for withholding the warrant for State appropriation of school money, to which such districts or educational institutions would otherwise be entitled.

No certificate shall be granted any person to teach in the public schools of the Commonwealth, or in any of the educational institutions receiving money from the Commonwealth, after the first Monday of June, Anno Domini 1886, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system.

Nine other State legislatures in 1885 enacted temperance education laws, viz., Maine, Alabama, Wisconsin, Kansas, Missouri, Nevada, Nebraska, Oregon, and Massachusetts, all using in substance the language of the New York statute, except Massachusetts, where the law is more like the Pennsylvania statute.

In 1886 Mrs. Hunt presented to Congress a temperance education bill which applied to all the Territories, the District of Columbia, the national military and naval academies at Annapolis and West Point, and the Indian and colored schools under Federal control. This bill had all the features of the Pennsylvania statute, with the more definite specifications that "the study shall be pursued with text-books by pupils able to read, and taught orally in the case of those unable." It was presented to the Senate by Senator Henry W. Blair, of New Hampshire, and in the House by Hon. Byron M. Cutcheon, of Michigan. Mrs. Hunt addressed the Senate and House Committees on Education in its behalf. It passed the Senate unanimously in March. The opposition that kept it three months in the House Committee was overcome by a popular demand from all parts of the country, and it finally passed the House May 17, 1886, without amendment, with only eight votes against it, and received the President's signature May 20.

During the same year, in addition to this act of Congress, the States of Iowa, Maryland, and Connecticut enacted temperance education laws, and Michigan and Vermont amended their statutes on the subject, making them more stringent, adding in each case the important specification that the study shall be taught with text-books that shall give "at least one fourth of their space to the consideration of the nature and effects of alcoholic drinks and other narcotics, and the books used in the highest grade of graded schools shall contain at least twenty pages of matter relating to this subject." In 1887 West Virginia, Colorado, California, and Delaware enacted temperance education laws; in 1888, Ohio and Louisiana; in 1889, Florida and Illinois. In 1890, North and South Dakota, Montana, and Washington, on coming into Statehood, either re-enacted the national law or substituted a statute of their own, as did Idaho and Wyoming in 1891. North Carolina also enacted an admirable temperance education law in 1891, and Mississippi in 1892, and Alabama added strengthening amendments to her statutes. For specifications of the statutes of these and other States, see the accompanying map. The following is the explanation of the marks:

× The cross signifies that scientific temperance is a mandatory study in public schools.

* The star signifies a penalty attached to the en-

forcing clause of this statute in the State or Territory to which it is affixed.

† The dagger signifies that the study is not only mandatory, but is required of all pupils in all schools.

‡ The double dagger signifies that the study is required of all pupils in all schools, and is to be pursued with text-books in the hands of pupils able to read.

§ The parallel indicates that the study is to be taught in the same manner and as thoroughly as other required branches.

¶ The section mark indicates that text-books on this topic used in primary and intermediate schools must give one fourth their space to temperance matter, and those used in high schools not less than twenty pages.

‡ The paragraph indicates that no teacher who has not passed a satisfactory examination in this subject is granted a certificate or authorized to teach.

At the close of 1891, 35 States and all of the Territories, including the District of Columbia, the Indian and colored schools, and national military and naval academies, were under temperance education laws, covering at least 12,000,000 children of school age. Only nine States were without such legislation, and bills providing for this instruction are now before the legislatures of three of these—New Jersey, Kentucky, and Mississippi.

The Parliament of Sweden in 1891 enacted a temperance education law, while in Canada, England, Finland, Norway, Germany, France, India, Australia, and other countries, preliminary agitation for the same is going on. A gold medal was awarded the exhibits of plans, reports, text-books, etc., of this department by the French Committee of Awards at the Paris Exposition in 1889; and a like exhibit won a diploma from the Massachusetts Charitable Mechanics' Association in 1890.

But this great volume of legislation is only a part of the movement. Not only the legal demand for an entirely new study in the public schools of the whole country had to be created, but school literature for all grades of pupils, its methods of teaching, and interest and ability on the part of teachers. There were text-books on temperance, but these did not meet the need. As unhygienic habits and methods of living may lead to indulgence in alcohol and other narcotics, the remedy proposed is an all-round physical education, including enough physiology to enable the pupils to understand the laws of hygiene and the consequences of violating them, especially in the case of narcotics. These subjects are therefore made a part of the study, as demanded by law. Scientific temperance may be therefore defined as physical education; or hygiene, including the nature and effects of alcoholic drinks and other narcotics, with enough anatomy and physiology to make it intelligible.

When the movement began there were no manuals of instruction or text-books that included the whole subject. The passage of the New York law roused authors and publishers, who had before doubted there ever being a sustained demand for this school literature, and books hurriedly prepared, with little or no temperance matter, but mostly technical physiology, and badly adapted to grade, were rushed upon the market. The duty of procuring better books and the revision of the imperfect ones had to be met as the work of legislation went on. In 1887 an advisory board of representative men

was appointed. The gentlemen comprising this board are Hon. William T. Harris, LL. D., United States Commissioner of Education; Rev. A. H. Plumb, D. D.; Rev. Joseph Cook, of the Boston Monday lectureship; Daniel Dorchester, D. D., United States Superintendent of Indian Schools; William A. Mowry, Ph. D.; and William E. Sheldon, President of the National Teachers' Association in 1887. As discussion on the text-book question went on, the need of an authoritative standard became evident. In 1887, with the aid of the advisory board and special experts, a syllabus of topics that books on this subject should teach was prepared, signed by more than 200 of the most representative names of the United States in medical, chemical, educational, legislative, and other circles interested in the public good, and was sent to all publishers of this kind of literature, respectfully asking that their books on this topic be revised to contain the latest truths of science as set forth in the petition. The following is a digest of this:

If this new education is to give to the world a generation of intelligent total abstainers, its manuals of instruction must conform to the following specifications:

1. They must teach with no uncertain sound the proved findings of science, viz.: (a) That alcohol is a dangerous and seductive poison. (b) That beer, wine, and cider contain this same alcohol, thus making them dangerous drinks, to be avoided, and that they are the product of a fermentation that changes a food to a poison. (c) That it is the nature of any liquor containing alcohol to create an appetite for more, which is so apt to become uncontrollable that the strongest warning should be urged against taking that little and thus forming the appetite.

2. They must also teach the effect of these upon the human system, that—is, upon the whole being, mental, moral, and physical. The appalling effects of drinking habits upon the citizenship of the nation, the degradation and crime resulting, demand that instruction here should give clear and emphatic utterance to the solemn warnings of science upon this subject.

During 1884-'85 and 1889-'91 numerous books were written or revised to meet the demands of science.

From its inception the National Department of Scientific Temperance has been in consultation with eminent authorities as to its various phases of work—legislative, physiological, chemical, and educational. In the interest of scientific accuracy, extensive researches have been made and are now carried on in the great medical libraries of Washington, New York, Philadelphia, and Boston. The headquarters of the department are at Hope Cottage, Hyde Park, Mass., a suburb of Boston. Here a corps of secretaries aid in replying to inquiries, and send out printed aids and other plans. A literary assistant searches the *Index Medicus*, a classified index of the current medical literature of the world, and other indexes, for all the new utterances on medical, physiological, hygienic, or chemical subjects, on sanitation, fermentation, and kindred topics. The books or articles thus found are procured, translated when necessary, thoroughly classified, and added to the comprehensive special library on this subject at Hope Cottage. The department has now in training persons from different parts of the country, who are

preparing to become teachers' institute instructors on this topic.

A Standard for the Enforcement of Temperance Laws, the result of conferences with experienced educators, has been formulated and signed by State and city superintendents of public instruction intrusted with the enforcement of these laws. This standard in circular form, widely circulated, constitutes the needed official opinion as to how this topic should be taught. A general oversight of this study as pursued in the schools is yearly reported, with results, by the State, county, and local superintendents, to the National Superintendent. These reports show that where the approved text-books, adapted to the various grades, and the methods of teaching as set forth in the standard of enforcement, are in use, an intelligent sentiment in favor of obeying the general laws of hygiene, especially with reference to alcoholic drinks and other narcotics, results. But where the imperfect books, chiefly technical anatomy and physiology, with little or no hygiene, are in use, less satisfactory results are reported. The returns of 1891 show a universal movement toward the approved books and methods of teaching.

TENNESSEE, a Southern State, admitted to the Union June 1, 1796; area, 42,050 square miles. The population, according to each decennial census since admission, was 105,602 in 1800; 261,727 in 1810; 422,771 in 1820; 681,904 in 1830; 829,210 in 1840; 1,002,717 in 1850; 1,109,801 in 1860; 1,258,520 in 1870; 1,542,359 in 1880; and 1,767,518 in 1890. Capital, Nashville.

Government.—The following were the State officers during the year: Governor, John P. Buchanan, Democrat; Secretary of State, Charles A. Miller; Treasurer and Insurance Commissioner, M. F. House; Comptroller, J. W. Allen; Attorney-General, G. W. Pickle; Superintendent of Public Instruction, Frank M. Smith, succeeded by W. R. Garrett; Commissioner of Agriculture, Statistics, and Mines, B. M. Hord, succeeded by D. G. Godwin; Chief Justice of the Supreme Court, Peter Turney; Associate Justices, W. C. Caldwell, B. L. Snodgrass, H. H. Lurton, and Benjamin J. Lea.

Population by Races.—The following table shows the white and colored population of the State in 1880 and 1890, as reported by the Federal census:

- There were also in the State, in 1890, 64 Chinese, 10 Japanese, and 173 Indians.

Finances.—For the two years ending Dec. 20, 1890, the total receipts of the State treasury, including a cash balance of \$221,702.06 at the beginning of the period, were \$3,957,000.06; the

total disbursements were \$3,877,234.20; and there remained a balance on Dec. 20, 1890, of \$79,765.86. Financially the State is in a more promising condition than at any time since the close of the rebellion, although an immense debt still hangs over it, the interest on which it is not yet able to meet fully without further borrowing. The General Assembly this year at its extra session revised the tax laws so as to increase the revenue, and at the regular session provided for refunding a considerable part of the State debt at a lower rate of interest, so that before 1893 the revenue will probably be sufficient to support the Government and meet all interest charges.

Legislative Sessions.—The regular biennial session of the General Assembly began on the first Monday of January, and ended on March 30. On Jan. 26 M. F. House was elected State Treasurer and J. W. Allen State Comptroller. In order to reduce interest on the public debt, the Funding Board was required to issue and sell new 4-per-cent. bonds, payable in fifteen years, and with the proceeds to redeem the 5, 5½, and 6 per cent. bonds issued in 1863, known as the State debt proper bonds. The same board was authorized to borrow such sums as may be necessary to pay the interest on the State debt up to January, 1893, and to issue notes therefor, payable out of any sums hereafter in the treasury not otherwise appropriated.

The following new congressional districts were established:

First District.—Counties of Johnson, Carter, Sullivan, Washington, Unicoi, Hawkins, Greene, Hamblen, Hancock, Claiborne, Cocke, and Grainger.

Second District.—Jefferson, Union, Sevier, Blount, Knox, Loudon, Roane, Anderson, Morgan, Campbell, and Scott.

Third District.—Monroe, Polk, Bradley, Hamilton, James, McMinn, Bledsoe, Grundy, Van Buren, White, Warren, Franklin, Marion, Meigs, and Sequatchie.

Fourth District.—Sumner, Wilson, Macon, Trousdale, Smith, Clay, Jackson, Overton, Putnam, Fentress, Pickett, Cumberland, and Rhea.

Fifth District.—Coffee, Lincoln, Moore, Rutherford, Marshall, Bedford, Cannon, and De Kalb.

Sixth District.—Davidson, Robertson, Cheatham, Montgomery, Stewart, Humphreys, and Houston.

Seventh District.—Williamson, Maury, Giles, Lawrence, Wayne, Lewis, Hickman, and Dickson.

Eighth District.—Henry, Benton, Perry, Decatur, Hardin, McNairy, Henderson, Madison, Carroll, and Chester.

Ninth District.—Weakley, Gibson, Crockett, Haywood, Lauderdale, Dyer, Obion, and Lake.

Tenth District.—Hardeman, Fayette, Shelby, and Tipton.

Provision was made for pensioning disabled Federal and Confederate soldiers and sailors, a board of State pension examiners being created to pass upon all applications. The allowance for total disability was fixed at \$25 a month, and for partial disability from \$10 to \$8.33½ a month.

All railroads, other than street railroads, were required to furnish equal but separate accommodations for the white and colored races, by providing two or more passenger cars for each train, or by dividing each car by a partition. All conductors were given authority to assign passengers to the proper car or apartment thereof.

A board of commissioners was created and authorized to distribute the sum received by the

State as a refund of the direct tax of 1861 among the persons that originally paid such tax, or their representatives.

Action upon a bill authorizing an appropriation for the World's Columbian Exposition was postponed until final disposition by Congress of the Federal Elections bill pending before that body, after which time the original bill was killed, and another was passed empowering the county courts to appropriate money for the purpose of exhibiting the resources of the county at the Exposition.

The Governor was authorized to appoint a commission to make, or cause to be made, surveys for locating a route for a canal or canals connecting the Cumberland and Tennessee rivers and the Tennessee and Mississippi rivers, and to collect facts of interest relating to such proposed canals, for the purpose of laying the subject before Congress. Another act provides that hereafter all mineral interests in land in the State shall be subject to taxation. The sum of \$25,000 was appropriated for a building with improvements, to be occupied as a home for disabled Confederate soldiers, to be erected upon the "Hermitage" at Nashville. The sum of \$10,000 was also appropriated for the support of such home for 1891 and 1892.

An amendment to Section 13, Article XI, of the State Constitution was proposed for submission to the people, giving to the General Assembly power to enact laws "for the construction, maintenance, working, and laying out of public roads, laws defining and establishing legal fences and abolishing all fences; also laws regulating elections."

Other acts of the session were as follow:

Setting apart the first Monday in September as a legal holiday, to be known as Labor Day.

Incorporating the city of Harriman and the city of Athens.

Amending the law giving contractors, laborers, material men, and others engaged in locating, constructing, repairing, or equipping any railroad a lien on the property of such road.

To prohibit the selling, giving, or furnishing of any cigarettes, cigarette paper, or any substitute for them, to any minor.

To regulate the practice of dentistry.

Making it a misdemeanor for any person to carry on the business of barbering on Sunday.

To establish county work-houses, to provide for working convicts sentenced to such houses; to declare county jails work-houses in such counties as have no separate work-houses, and to provide a superintendent and other officers therefor.

Allowing railroad companies to purchase and consolidate with branch lines, but forbidding the consolidation of parallel or competing lines.

To protect the public against fraudulent pedigrees in live stock.

Authorizing the erection and maintenance of county asylums for the insane, the poor, and the inebriate in counties of 4,000 inhabitants or over.

To enable county courts to inaugurate general improvements in public roads, and to authorize the issue of county bonds in order to raise money for such improvements.

To regulate the business of building and loan associations.

To provide for an enumeration of the male inhabitants of the State of twenty-one years and upward.

Authorizing the city of Knoxville to issue bonds to the amount of \$500,000, the proceeds from the sale of which to be devoted to the following objects, viz.,

\$250,000 for sewers, \$125,000 for bridges, and \$125,000 for streets.

Assenting to the provisions of the act of Congress appropriating money for the more complete endowment and support of colleges of agriculture and the mechanic arts in the several States.

Revising and codifying the State insurance laws.

To declare unlawful all trusts, pools, contracts, arrangements, and combinations in restraint of trade, production, manufacture, and sale.

On Aug. 7, Gov. Buchanan issued his proclamation calling an extra session of the General Assembly to meet on Aug. 31. The chief cause for this action was the disturbances in East Tennessee, arising out of the employment of State convicts in the mines in competition with free labor, an account of which is given elsewhere. The leading subjects proposed by the Governor for legislative action related to the abolition of the convict lease system, or such modification thereof as would prevent the employment of convicts in mines, and thereby meet the demands of the belligerent miners. Early in the session a committee was appointed to confer with the Penitentiary lessees, and ascertain whether they would consent to any modification of their lease which would require the State convicts to be worked at certain mines where no other labor should be employed, and whether they would sublet a portion of the convicts to be used in constructing a State penitentiary. The result of these negotiations was not wholly satisfactory to the legislators. After prolonged and excited discussion the session came to an end on Sept. 21 without any action on this subject, the legislators refusing to entail upon the State the expense of building a new penitentiary such as the abolition of the lease system would necessitate. In addition to refusing the demands of the miners, the Assembly enacted several laws designed to prevent further outbreaks by them. Authority was given to the Governor to summon and use the sheriff of each county with a posse of as many men as the Governor shall designate, and to call out the State Guard of Tennessee whenever he shall deem it necessary for the purpose of repelling invasion or suppressing insurrections, mobs, and like unlawful assemblies, whether existing or imminent. He may keep such force in the employ of the State as long as a necessity therefor exists, but such authority shall continue only until the close of the next regular session of the General Assembly. By another act it was declared a felony for any person to hinder, interrupt, or interfere with the working of convicts or work-house prisoners, wherever they may be, or to act as a leader of any mob or company of men who shall so interfere, the punishment being imprisonment from one to seven years. The sum of \$25,000 was appropriated for the support and maintenance of the State militia in case their services should be needed.

At this session an act was also passed restricting the State for members of the State Senate and House of Representatives. It was enacted that all ballots hereafter cast in elections shall be of plain white paper, seven inches long and three inches wide. It was made unlawful to place any picture, sign, color, mark, or insignia thereon, except the names of the candidates and the office.

Other acts of the session were as follow :

To compel all persons, firms, corporations and companies engaged in constructing railroads or in mining or manufacturing to settle with their employes at least once in thirty days, and to pay them in lawful money of the United States.

To prohibit prize fighting, sparring matches, and other brutal sports or exhibitions, and to punish participants therein.

Creating a State Board of World's Fair managers.

Education.—The following public-school statistics, covering the school year ending June 30, 1890, are reported by the State Superintendent: Children of school age (between six and twenty-one years), white males, 261,796; white females, 248,793; colored males, 88,372; colored females, 87,349; total, 686,310; pupils enrolled, 420,104; average daily attendance, 296,765; average length of school year, in days, 86; teachers employed, males, 4,827; females, 3,084; average monthly wages of teachers, \$31.24; number of white schools, 5,395; colored schools, 1,536; school-houses, 6,048; erected during the year, 265; value of school property, \$2,830,319.61.

The financial statement for the year is as follows: Amount on hand July 1, 1889, \$620,752.29; received from the State, \$128,806.87; from the counties, \$1,206,926.26; from other sources, \$82,072.92; total receipts, \$2,038,558.35. Expenditures: Teachers' salaries, \$1,078,265.63; school sites, buildings, and repairs, \$77,256.99; furniture, etc., \$36,855.44; other expenses, \$106,982.61; total expenses, \$1,300,351.67; balance on hand, July 1, 1890, \$738,206.68. During the year 1,069 private schools reported 1,447 teachers, 40,683 pupils enrolled, and an average attendance of 28,378.

At the State University the attendance for the year ending 1890 was as follow: Academic Department, 251; Law Department (established in February), 8; Medical and Dental Department, 251; total, 510.

Charities.—At the Eastern Hospital for the Insane there were 232 patients on Dec. 19, 1888; 182 were admitted during the two years ensuing, and 163 were discharged, leaving 251 on Dec. 19, 1890. The total receipts for the two years were \$107,899.98, and the total expense \$100,075.51. At the Western Hospital there were received on Nov. 22, 1889, from the Central Hospital 156 patients, being the first installment of patients received at this institution, the buildings for which were then in an unfinished condition. Up to Dec. 19, 1890, there had been received 128 other patients, and 35 had been discharged, leaving 249 in the hospital on the latter date. The expenses up to Dec. 19, 1890, were \$52,419.45, and the receipts \$44,422.02. The Central Hospital, at Nashville, contained 432 patients on Dec. 19, 1888; during the two years following 289 were admitted and 335 discharged (including 156 transferred to the Western Hospital), leaving 386 remaining on Dec. 19, 1890. The receipts were \$150,927.95, and the expenses \$152,205.07. On March 13, 1891, the buildings at this hospital used for the male patients were entirely destroyed by fire, several of the inmates losing their lives. Those who escaped and could not be accommodated at the other buildings, being about 100 in number, were transferred to the Western Hospital.

At the Tennessee School for the Blind there were 72 white and 13 colored pupils in December, 1890. The receipts for two years were \$34,005.60, and the expenses \$33,430.15. The Tennessee Deaf and Dumb School contained 127 pupils on the same date. The receipts for the preceding two years were \$58,308.10, and the expenses \$55,408.10.

Industrial School.—Since the opening of the State Industrial School in 1887, 203 white and 32 colored persons have been placed under its discipline, of whom 65 white and 7 colored had been discharged up to Dec. 1, 1890, leaving on the latter date 138 white and 25 colored persons in the institution. For the two years ending Dec. 1, 1890, the receipts were \$35,800.27, and the expenses \$35,884.43.

Convict Mining Troubles.—On the night of July 14 a mob of 300 armed men, composed of miners and persons in sympathy with them, attacked and overpowered the guards at the State convict camp at Briceville, in Anderson County, and forced the lessees having charge of the prisoners to carry them by train to Knoxville. The local authorities, being powerless to cope with the mob, called upon the Governor for assistance, and on July 15 he ordered Adjutant-General Norman to place two Chattanooga companies of the militia and one Knoxville company under orders to go to Briceville. Taking a train from Nashville, the Governor was joined at Chattanooga by the two companies and at Knoxville by the third company. At the latter place, where he arrived on the morning of July 16, the car containing the expelled convicts was attached to the train, and Briceville was reached on the same day at noon. The mob having already dispersed, the convicts were peaceably returned to camp, the number of guards increased, and a detachment of the militia left to insure protection. At the request of a committee of the miners, the Governor then attended one of their meetings near Briceville, at which he counseled obedience to law, and emphasized his determination to preserve order. The grievances of the miners, as set forth at this meeting, were that the Tennessee Coal and Iron Company, their employer, and the lessee of the State convicts, habitually paid them in scrip instead of lawful money; that they were not free to purchase their supplies wherever they desired; and that, when they asserted their right under the law to appoint their own check-weighman to protect their interests in the weighing of coal mined, the company at once shut down their mines in order to bring them to terms. A still greater grievance was, that they were compelled to work in competition with low-priced convict labor, the presence of which was used by the company as a scourge to force free laborers to its terms. The Governor returned to Nashville on July 18, and ordered Adjutant-General Norman to Briceville as his representative. Before the latter reached his destination the miners had gathered from various quarters, armed forces coming from Kentucky to aid them, until they had sufficient numbers to overpower the guards and militia; and the latter, to avoid a disastrous conflict, agreed to withdraw the convicts again to Knoxville. The Governor then ordered out ten companies of militia, and again went to Knoxville

on July 21. There, on July 22, a committee of the miners asked for a conference, and after two days of negotiation they agreed to submit to a return of the convicts, with the understanding that the Governor would call an extra session of the Legislature and advise the repeal of the lease system, or its modification to meet the demands of the miners, together with such other legislation as would give them their rights. Accordingly, on Aug. 7 the Governor issued his proclamation calling an extra session to meet on Aug. 31. The proceedings of this session are elsewhere treated. It not only failed to make the slightest change from the lease system or in the terms of the existing lease, but it conferred greater powers upon the Governor for preserving order, and imposed heavy penalties for interference with convicts. Its only concession to the miners was an act requiring the payment of employés in cash, and a settlement with them at least once in thirty days. This result was accepted with ill grace by the miners, and by the people of the eastern part of the State, who were generally in sympathy with the miners, and whose attitude made the work of the mob in each case much less difficult than it would otherwise have been. After the close of the session, on Sept. 21, a period of quiet ensued, during which the miners sought to obtain relief through the courts. A case was brought in the local court based upon the claim that the mines were not a prison within the meaning of the convict lease, and that prisoners were illegally worked therein. The local judge sustained this view, but the State Supreme Court, to which the case was appealed in October, reversed the decision. The miners thereupon took matters into their own hands again. On the night of Oct. 30 an armed mob of about 2,000 persons visited the camps at Briceville and Coal Creek, intimidated the guards, set free 305 convicts, furnishing them with citizens' clothing, set fire to the camps, and ransacked the store of the mining company at Coal Creek. The news of this outbreak brought Gov. Buchanan to Knoxville again, where he issued a proclamation on Nov. 2, offering a reward of \$5,000 for the capture and conviction of the leaders of the mob, and \$25 for the capture and return of each of the escaped convicts. Meanwhile, on the morning of the same day, an armed mob of about 200 horsemen descended upon the camp at Oliver Springs, released about 150 convicts, and set fire to the camp. This new humiliation was followed by a new proclamation of the Governor offering the same rewards as in the Briceville and Coal Creek affair. Great efforts were now made to recapture the released convicts; but the work was slow, and many had left the State. In the course of five or six weeks about 300 had been returned to the main prison at Nashville, where they were kept to await the orders of the Governor. Meanwhile the stockades at the mines were rebuilt, and late in December preparations were made to return the convicts for the third time to Briceville. On their return journey, Jan. 1, 1892, they came accompanied by 108 militiamen, with Gatling guns and with supplies for three months. No opposition was offered by the miners. At the close of the year the mob leaders were still undiscovered.

Agriculture.—The State Bureau of Agriculture reports the following statistics for 1890: Wheat, acres sown, 1,306,228, yield, 3,587,980 bushels; corn, 3,410,526 acres, yield, 55,269,865 bushels; cotton, 820,719 acres, yield, 344,385 bales; tobacco, 34,966 acres, yield, 22,080,844 pounds; pea-nuts, 18,012 acres, yield, 17,440,969 pounds. The live stock on farms in April, 1890, was as follows: Horses, 289,057, value, \$21,879,907; mules, 190,542, value, \$15,307,559; cows, 342,508, value, \$6,477,252; other cattle, 474,656, value, \$4,773,491; sheep, 427,623, value, \$832,330; hogs, 1,916,363, value, \$5,835,430.

Coal.—The product during the year ending June 30, 1880, as reported to the tenth census, was 493,131 short tons, valued at \$629,724 at the mines, an average of \$1.27 a ton. During 1889 the total production was 1,925,689 short tons, valued at \$2,338,309 at the mines, an average of \$1.21 a ton. The number of mine employes in 1889 was 4,108, and the wages paid \$1,609,310. The mining expenses were \$2,113,292, and the capital employed, \$4,362,711.

Pensions.—Under the pension law passed by the General Assembly this year the board of pension examiners had received 816 applications up to Nov. 25. Of these, 367 were allowed, 351 rejected, and the others are pending. The pensions already allowed aggregate \$42,320 yearly.

TEXAS, a Southern State, admitted to the Union Dec. 29, 1845; area, 265,780 square miles; population, according to the census of 1890, 2,235,523. Capital, Austin.

Government.—The following were the State officers during the year: Governor, James S. Hogg, Democrat; Lieutenant-Governor, George C. Pendleton; Secretary of State, George W. Smith; Treasurer, W. B. Wortham; Comptroller, John D. McCall; Attorney-General, Charles A. Culbertson; Superintendent of Public Instruction, H. C. Pritchett to August, when J. M. Carlisle was appointed; Adjutant-General, W. H. Mabry; Commissioner of General Land Office, W. L. McGaughey; State Health Officer, Dr. R. M. Swearingen; Commissioner of Insurance, L. L. Foster, succeeded in August by J. E. F. Hollingsworth; Chief Justice of the Supreme Court, John W. Stayton; Associate Justices, Reuben R. Gaines and John L. Henry; Court of Appeals, Presiding Judge, John P. White; Judges, Samuel A. Willson and James M. Hurt. D. P. Marr was appointed on the commission of the Court of Appeals Jan. 30, and C. C. Garrett, May 7.

Finances.—The receipts for the year ending Aug. 31, 1891, were \$2,561,069.42, exclusive of the transfers. This was derived principally from the following sources: Taxes of 1889, \$24,351.55; of 1890, \$1,974,696.76; of 1891, \$148,979.42; special taxes and fees collected by Comptroller, \$127,330.13; refunded by United States frontier protection, \$145,037.18; refunded to appropriations, \$86,835.65; half of land sales, act of July, 1879, \$75,110.87; office fees, State Department, \$48,878.59; office fees, General Land Office, \$21,980.81; office fees, Insurance Department, \$14,034.70; half of land sales, act of March, 1887, \$15,647.11.

The disbursements for the year were \$2,167,498.21, exclusive of transfers. The balance in the treasury Aug. 31, 1890, was \$618,622.66, and Aug. 31, 1891, it was \$1,007,193.87.

The bonded debt of the State remains the same as last year, \$4,237,730. The redemption of the \$41,700 of the 6-per-cent. funding bonds of act of May 2, 1871, held by individuals, and of the \$207,000 of 7-per-cent. revenue deficiency bonds of act of Dec. 2, 1871, also held by individuals, has been provided for by the general appropriation act, approved April 16, 1891, which provides for their payment by an issue of 5-per-cent. bonds, to be sold to the permanent school fund. The total amount held by individuals is \$1,019,590. No provision has been made for the redemption of the \$200,000 6-per-cent. revenue deficiency bonds of act of Feb. 13, 1885, held by special funds, which fell due Jan. 1, 1890.

The total assessed value of real estate was \$577,621,608, and of personal property \$278,578,675; total, \$856,200,283, showing an increase over the preceding year of \$53,344,398 in real estate and \$20,744,002 in personal property, or a total increase of \$74,088,400 over the values of 1890. The rate of tax was 20 cents on each \$100.

Education.—The latest available report of the common schools gives the following summary: Number of schools taught, 9,065; number of graded schools, not including cities, 307; number of high schools, not in cities, 109; average school term in months in cities, 7-62; in district counties, 5-01; in community counties, 4-83; total number of pupils enrolled, 466,872; number of teachers employed in 90 cities and 193 counties, 10,980; number of public school-houses belonging to the State, 5,326; number rented or leased, 2,998; number of public-school libraries, 103; number of volumes, 16,107; average monthly salary in cities and independent districts, \$59.39. The total amount paid to teachers was \$2,533,644.62, and the total amount of expenditures, \$3,178,299.96.

The latest biennial report of the University of Texas, at Austin, gives the number of the faculty at 17, and the total number of students at 307, of whom 4 are in the post-graduate course, 79 are in the law course, 87 are irregular and special students, and the remainder in the regular under-graduate course. The estimated income for 1890-'91 from interest on State bonds, lease of lands, interest on land sales, and fees, was \$52,983.54.

The university received in December the proffer of a valuable library from Tank Kee, a lecturer on China. This library embraces 38,000 volumes, some of them rare old manuscripts, but most of them in English print, and all valuable bound books, which he has been twenty years collecting, and are valued at from \$120,000 to \$150,000. They all refer to China, and are represented to be the most complete collection of the history, literature, religion, arts, etc., of the Chinese in the world.

A medical branch of the university was opened at Galveston, Oct. 1. The sum of \$52,000 was appropriated for its equipment and maintenance.

In May, \$200,000 was given by W. M. Rice, of New York, formerly of Houston to establish in Houston the William M. Rice Institute for the Advancement of Literature, Science, and Art.

The Sam Houston Normal Institute at Huntsville had an enrollment of 313. The State appropriation in 1890 was \$20,000, and the total

receipts, including the balance at the beginning of the year, \$54,023.16. A new building has been erected with a State appropriation of \$40,000. The Houston Memorial Hall in this building is one of the finest auditoriums in the State, having accommodations for 1,500. H. C. Pritchett was appointed President in August.

Legislative Session.—The twenty-second Legislature met on Jan. 13 and adjourned on April 13. Two of the laws passed occasioned a great amount of adverse criticism and opposition on the part of the public. One of these was the bill establishing a railroad commission. The Governor, in his message, called the attention of the Legislature to the constitutional amendment requiring it to "pass laws regulating railroad freight and passenger tariffs," and to "provide all requisite means and agencies with such powers as may be deemed adequate and advisable." The act passed on this subject was entitled "An Act to establish a railroad commission for the State of Texas, whereby discrimination and extortion in railroad charges may be prevented, and reasonable freight and passenger tariffs may be established; to prescribe and authorize the making of rules and regulations to govern the commission and the railroads, and afford railway companies and other parties adequate remedies; to prescribe penalties for the violation of this act, and to provide means and rules for its enforcement." It provided for the appointment by the Governor, with the consent of the Senate, of a railroad commission of three persons not interested in any railroad, to receive each an annual salary of \$4,000 from the State, with provisions for salaries of secretary and clerks and traveling expenses; they were to have power to govern and regulate railroad freight and passenger traffic; to classify all freight, to fix the rates, to adjust the division of the charges on freight carried over more than one line, and to fix rates for storage and handling of freight, and the use of cars not unloaded by the consignee. Any railroad company having cause of complaint against the rulings of the commission should have the right to file a petition in court, when the case should take precedence of all other causes of a different nature. The commission should investigate all complaints against the companies and impose the damages, if any, the case to be taken to the courts only in case of the failure of the company to pay, when the evidence taken by the commission, if reduced to writing and sworn to, could be used in court. The commissioners also to have the right to inspect the books and papers of any company, and to examine under oath any officer, agent, or employé of such railroad in relation to its business and affairs; and for any failure to allow such inspection the company should pay a fine of not less than \$125 nor more than \$500 for each day it should so fail or refuse. This act originated in the House and passed it by a vote of 92 to 5, and passed the Senate by a vote of 26 to 0. It was approved April 3.

It was objected to this bill, on the part of the railroads, that it conferred almost absolute powers on the commission; that by the exercise of its powers that commission could bankrupt any railway in the State; and as soon as the commission began its work complaints were made of

unjust discrimination in specific cases. Objections were also made to the office of commissioner being made appointive instead of elective.

The other important bill mentioned was entitled "An Act to prohibit aliens from acquiring title to or owning lands within the State of Texas." It provided that no person not a citizen of the United States could own land in Texas unless he had declared his intention of becoming a citizen of that State. All aliens who should hereafter take lands by devise or descent could hold them for six years and no longer, except in the case of minors, who should be exempt six years after coming of age, or of persons of unsound mind. The act was, of course, intended to bar out foreign corporations rather than individuals, but applied to both; and it was a question whether the charters of such corporations, as contracts with the State, would not enable them to stand upon their rights against the law. A test case came up in a suit against an individual owner, and the law was pronounced void for want of a proper title. The judge also said that the act was at variance with treaties and conventions existing between the United States and other powers.

The Confederate Soldiers' Home, at Austin, was transferred from private to State management, to be placed in charge of a board of 5 ex-Confederate soldiers appointed by the Governor, and \$25,000 was appropriated to provide additional buildings, and \$50,000 for the maintenance of the home for two years.

Among other acts passed during the session were the following:

Prohibiting prize fighting.

Preventing the acquirement of title to land by ten years' possession under certain circumstances. This provides that no person, firm, or corporation, who have now or shall hereafter have within one inclosure more than 2,000 acres, including in the same land belonging to others, shall have any right to claim such land other than their own, by reason of ten years' occupancy or possession of the same, unless such land not their own has been segregated and separated from all other lands, and fenced in a separate inclosure for a period of ten years, or unless at least one tenth of the land so claimed has been used for the same period for agricultural purposes.

Providing for the destruction of wolves and other wild animals.

Making abstracts of land titles or land-title books to lands in this State compiled from the records of any county in this State prior to the year 1880, which said records have been partially or wholly destroyed from any cause prior to the year 1880, *prima facie* evidence of the truth of the data or memoranda shown by such abstracts of land titles or land-title abstract books, subject to certain conditions. [The bill provides that abstracts of land titles certified to by the compiler shall be received as testimony as to the validity of titles.]

To close barber shops on Sundays.

To fix the rate of taxation for the maintenance of the public free schools at twenty cents on the hundred dollars.

To make express companies subject to the control of the railroad commission.

To create the county of Sterling out of Tom Green County.

Providing a pension of \$150 for Madam Andrea Castanon de Villanueva, better known as Juana as Madam Candelaria, of San Antonio, who was a nurse to the sick Texans during the siege of the Alamo.

To protect the sea-gull, tern, shearwater, egret, heron, and pelican, and their eggs.

Regulating corporations engaged in the business of guaranteeing or acting as security for the fidelity of persons in public or private offices, employments, or positions.

Giving the county judge, under the direction of the State superintendent, the immediate supervision of all matters pertaining to public education in his county.

Regulating the establishment of quarantine.

Authorizing Jewish rabbis to perform marriage ceremonies.

Regulating voting in cities and towns of 5,000 inhabitants or more.

Requiring railroad companies to provide separate coaches for white and negro passengers, with penalty for failure of a fine not exceeding \$1,000, each trip run by any train without such separate coaches to be deemed a separate offense. A supplementary bill vests official power in conductors, and allows nurses to travel with their mistresses.

To encourage the construction and maintenance of deep-water harbors, navigable channels, docks, and wharves on the Gulf coast within the State of Texas. This provides that any individual, association of individuals, company, or corporation, who is now authorized or who may hereafter be authorized by an act of Congress of the United States to construct, own, operate, or maintain with private capital a deep-water harbor, navigable channel, docks, or wharves on the Gulf coast of Texas, shall be permitted to purchase certain lands from the State.

The appropriations made amounted to \$4,700,000.

The Governor vetoed a bill passed accepting a bonus to the State by the United States on the sugar produced on the convict farms.

In April, United States Senator Reagan resigned his seat, and on April 23 the Governor appointed Horace Chilton, of Tyler, to fill the vacancy.

John H. Reagan, L. L. Foster, and W. P. McLean were appointed railroad commissioners.

Amendments to the Constitution, voted favorably upon by the people and declared adopted, Sept. 22, allowed local option in small communities; reduced the legal rate of interest to 6 per cent., and declared anything over 10 per cent. usurious; authorized the use of 1 per cent. of the permanent school fund per annum; provided for preventing and punishing frauds in elections; and authorized the reorganization of the higher courts of the State.

Extra Session.—An extra session of the Legislature was called to meet in the spring of 1892. Among the subjects to come up were changes in the railroad commission law, the repeal or modification of the alien land law, the location of the new courts, and the election of a successor to Senator John H. Reagan.

Charities.—The Deaf and Dumb Asylum at Austin received an appropriation of \$30,000 from the Legislature for a new building, which was finished in September. It has accommodations for 350 inmates. The enrollment is 233, with an attendance of 195. The Asylum for Deaf, Dumb, and Blind Colored Youth has an enrollment of 64, with an attendance of 60. The annual expense is about \$15,000.

The State Lunatic Asylum, at Austin, cost \$130,326.54 for the year, of which \$107,946.59 was for actual maintenance. The number of inmates on Oct. 31, 1891, was 629. During the year 27 were discharged restored and 37 improved. The percentage of recoveries of those that were admitted was 25.47, and of both recovered and improved, 60.37.

The North Texas Hospital for the Insane, at Terrell, had a total of 606 patients on Nov. 1, 1891. The whole number under treatment for the year was 862. Of these, 198 were discharged, 50 died, and 2 escaped. It was maintained at a cost of \$112,137.91.

A new institution, the Southwest Texas Lunatic Asylum, was opened in December. It is at Florine, a little station on the Aransas Pass Railway, 5 miles south of San Antonio. The building, which is composed of 5 parts, has a frontage of 400 feet, and a tower rising nearly 140 feet from the surface of the hill on which the structure stands. It is of white Calaveras brick, and was built at a cost of about \$180,000, exclusive of the heating apparatus, the plumbing, and the artesian well. About 300 patients can be accommodated in it with quarters which are much more comfortable than those of the other State asylums.

Military.—The State militia is made up of 73 companies, with an aggregate number of 3,073, with armories valued at \$68,100. Other armories were rented at a cost of \$6,518 for the year. The Frontier Battalion traveled 50,929 miles, and made 368 arrests, with other assistance to the civil authorities. A permanent location for the annual encampments has been secured this year. It is about 3 miles from Austin, near the great dam lake. The land and money for the necessary improvements were given by the citizens of Austin.

A squad of United States regulars had a skirmish in Hidalgo County, Dec. 22, with a company of Garza's Mexican revolutionists, in which Corporal Ediston was killed. Gen. Stanley sent troops from San Antonio to the assistance of those at Laredo.

Minerals.—A recent bulletin issued by the Census Office at Washington shows the product of coal in Texas during the census year to have been 128,216 tons, with a spot value of \$340,620, and an average price of \$2.66.

The amount of silver bullion credited to the State in Wells, Fargo & Co.'s annual report was \$264,423.

Attention has been attracted by the announcement of the discovery of a new mineral resembling asphalt, impervious to water, and unaffected by heat, acid, or alkalis. It is claimed for this new substance that "it is the most perfect insulator yet discovered; that it may be used as a paint that will resist the action of heat, salt air, salt or fresh water, gases, or the other influences that destroy the paints now in use; that it will make a perfect varnish which the ammonia gases of the stable will not tarnish, and that will remain undisturbed under all atmospheric conditions; that it may be rolled into a tissue that is entirely free from odor and practically indestructible when employed in the making of mackintoshes, canvas belting, water-proof tents, etc.; that it possesses peculiar powers of penetration when applied at high temperatures, enabling it to enter and fill the pores of iron and steel, making these metals absolutely impervious to acids, etc., and making common leather entirely water-proof; and that it may be applied to wood pulp in such a way as to transform that material into what looks and acts like ebony or horn."

TURKEY, an empire in southeastern Europe and western Asia. The throne descends to the eldest of the princes of the house of Osman. The Constitution proclaimed on Dec. 23, 1876, is practically annulled, no Assembly having been convoked since 1877. The Sultan is represented as ruler of the state by the *Sadr-azam* or *Vizier*, and as Supreme *Khalif* or ecclesiastical chief of the Mohammedans by the *Sheikh-ul-Islam*. The reigning Sultan is *Abdul Hamid II*, born Sept. 22, 1842, who succeeded to the throne when his brother, *Murad V*, on Aug. 31, 1876, was deposed on the ground of insanity. The *Sheikh-ul-Islam*, in the beginning of 1891, was *Omer Lufti Effendi*, and the *Grand Vizier* was *Kiamil Pasha*, who presided over the following Cabinet of ministers: *Aarifi Pasha*, President of the Council of State; *Said Pasha*, Minister of Foreign Affairs; *Ali Said Pasha*, Minister of War; *Hassan Pasha*, Minister of Marine; *Munir Pasha*, Minister of the Interior; *Raif Pasha*, Minister of Public Works and Commerce; *Riza Pasha*, Minister of Justice; *Agop Pasha Kazazian*, Minister of Finance and the Civil List; *Munif Pasha*, Minister of Education; *Zihni Pasha*, Minister of Evkafs or ecclesiastical affairs.

Area and Population.—The area of the Ottoman Empire, including Bulgaria and Eastern Roumelia, Bosnia and Herzegovina, Samos, Egypt, and Tripoli, is 1,652,533 square miles, and the total population is estimated at 33,566,000. The territory under the immediate rule of the Sultan embraces 63,850 square miles in Europe, with 5,600,000 inhabitants, and 729,170 square miles in Asia, with 15,430,000 inhabitants. In European Turkey about one quarter of the population are *Osmanli Turks*, one quarter are Greeks, one fifth Albanians, and the rest are Serbs, Bulgars, Wallachians, Armenians, Magyars, gypsies, Jews, and Circassians. In Asiatic Turkey the Turks form a large proportion of the population, and there are 4,000,000 Arabs, after whom the Greeks, Syrians, Kurds, Armenians, Circassians, and Jews are the most numerous races. The principal cities of European Turkey are Constantinople, the capital, with 873,565 inhabitants in 1885; Salonica, with about 150,000; and Adrianople, with 70,000. In Asia, Smyrna has 186,510; Damascus, about 150,000; Aleppo, 110,000; Bagdad, 100,000; Beirut, 70,000; Erzerum, 60,000; Brussa, 60,000.

Finances.—The last official budget, that for the year ending March 12, 1884, estimated the receipts at 1,631,300,600 piasters, and expenditures at 1,622,301,600 piasters (the Turkish piaster = 43 cents). For 1887-'88 the revenue was estimated at about 1,750,000,000 piasters. In accordance with an arrangement with creditors of the Porte, an *irade* was issued in 1881 authorizing the emission of certificates to the amount of £92,225,827 sterling for the conversion and consolidation of the Ottoman debt. The capital of the Roumelian railroad or Turkish lottery loan was reduced to £14,211,407, making the total debt £106,437,234 instead of £190,997,980, the amount outstanding previous to the compromise. Since 1882 interest has been paid on the reduced capital at the rate of 1 per cent. per annum from the assigned revenues administered by the committee of foreign bondholders. These revenues are the tobacco and

salt monopolies, the excise and stamp duties, fisheries, silk, and tobacco tithes, duty on Persian tobacco, and the tribute moneys paid by Cyprus and Eastern Roumelia. By the operation of the sinking fund the amount of the debt had been reduced by 1887 to £104,458,706. Debt not entering into the conversion arrangement amounted to about £13,500,000, besides £6,500,000 of new stock issued in 1886 to redeem the floating debt, £32,000,000 owing to Russia as the war indemnity, and internal loans amounting to about £10,500,000. The new Minister of Finance in the autumn of 1891 arranged for a 3-per-cent. loan of £5,000,000, raised at 60 and secured on a monopoly of the Tumbeki or Persian tobacco, for the purpose of repaying advances and buying in France two armored cruisers costing 35,000,000 francs.

The Army.—The laws of May, 1880, November, 1886, and February, 1888, make military service obligatory for a period of three years in the regular infantry and four years in the other arms. Conscripts are required to serve with the colors five months, at the end of which they can buy exemption from further service. After the full term of active service has expired the soldiers are enrolled in the reserves for three or two years respectively, then in the *Redif* for eight years, and in the *Mustahfiz* for six years longer. The peace effective of the *Nizam* or regular army is approximately estimated as follows: Officers, 12,000; infantry, 97,200; cavalry, 20,800; field artillery, 9,200; fortress artillerymen; 5,000 engineers; and 8,600 other troops. When the system of conscription goes into full operation it is expected that 800,000 trained soldiers can be placed in the field. The artillery is provided with 1,248 field and mountain guns, and the fortresses contain 2,300 cannons.

The Navy.—The Ottoman fleet of war consisted in 1890 of 7 armored frigates, 8 armored corvettes, 3 imperial yachts, 3 ironclad monitors, 4 unarmored frigates, 2 unarmored corvettes, 1 torpedo catcher, 5 gunboats, 15 transports, and 12 large and 8 small new torpedo boats, besides 2 submarine torpedo boats and 30 of the old type. There are in course of construction 1 ironclad, 3 torpedo cruisers, 1 gun-vessel, 2 corvettes, and 5 sea-going torpedo boats. The period of service in the navy is twelve years, of which five years are passed in the active navy, three in the reserve, and four in the *Redif*.

Commerce.—The total value of imports, as returned by custom-house officials for the year ending March 12, 1890, was 2,010,595,000 piasters, of which 914,514,000 piasters came from Great Britain, 409,144,000 piasters from Austria-Hungary, 254,369,000 piasters from France, 173,323,000 piasters from Russia, 112,420,000 piasters from Bulgaria, 53,001,000 piasters from Persia, 42,438,000 piasters from Italy, 41,574,000 piasters from Belgium, 39,451,000 piasters from Roumania, 29,435,000 piasters from Greece, 9,349,000 piasters from Holland, 6,438,000 piasters from Servia, 6,028,000 piasters from the United States, and smaller amounts from other countries. The total value of the exports was 1,517,243,000 piasters, of which 583,393,000 piasters went to Great Britain, 426,951,000 piasters to France, 135,492,000 piasters to Austria-Hungary, 98,777,000 piasters to Egypt, 68,975,000 piasters to Italy, 52,

115,000 piasters to Greece, 38,119,000 piasters to Bulgaria, 32,414,000 piasters to Russia, 25,031,000 piasters to Holland, 24,619,000 piasters to Roumania, 15,735,000 piasters to the United States, and 14,682,000 piasters to all other countries. The following were the principal articles of importation and their values in 1888-'89: Grain and flour, 188,639,000 piasters; sugar, 125,951,000 piasters; cotton thread, 107,122,000 piasters; cotton prints, 97,069,000 piasters; coffee, 95,345,000 piasters; cotton and wool stuffs, 68,471,000 piasters; rice, 65,492,000 piasters; animals, 62,496,000 piasters; hides and skins, 52,356,000 piasters; petroleum, 51,356,000 piasters; drugs and colors, 47,754,000 piasters; butter and cheese, 33,092,000 piasters; cloths, 32,400,000 piasters; iron, 29,135,000 piasters; casimir and castor stuffs, 25,752,000 piasters; paper, 25,038,000 piasters; apparel, 20,527,000 piasters; timber, 20,079,000 piasters; leather, 22,930,000 piasters. The values of the principal exports were as follow: Ruins, 201,747,000 piasters; cereals, 134,100,000 piasters; opium, 80,431,000 piasters; raw silk, 80,200,000 piasters; mohair, 60,536,000 piasters; wool, 56,272,000 piasters; oak galls, 54,409,000 piasters; coffee, 53,894,000 piasters; figs, 42,357,000 piasters; olive oil, 40,572,000 piasters; cotton, 36,954,000 piasters; cocoons, 33,338,000 piasters; drugs and colors, 32,534,000 piasters; minerals, 29,113,000 piasters; live animals, 26,796,000 piasters; carpets, 19,628,000 piasters; dates, 17,930,000 piasters; seeds, 15,530,000 piasters; wine, 15,292,000 piasters; beans and lentils, 15,262,000 piasters; butter and cheese, 14,764,000 piasters; nuts and fruit, 13,862,000 piasters; sesame, 13,776,000 piasters; confectionery, 13,574,000 piasters.

Navigation.—There were 174,338 vessels, of 27,581,927 tons, including 35,548 steamers, entered and cleared at the Mediterranean ports in 1887-'88; 3,650, of 538,945 tons, of which 461 were steamers, at the ports of the Red Sea; and 1,173, of 162,159 tons, including 96 steamers, in the Persian Gulf. The merchant navy in 1890 comprised 94 steamers over 100 tons, of 71,607 tons, and 813 sailing vessels, of 158,170 tons.

Communications.—The railroad lines in operation in 1890 in European Turkey had a total length of 904 miles, viz., 210 miles from Constantinople to Adrianople, 152 miles from Adrianople to Saremby, 150 miles from Salonica to Uskub, 75 miles from Uskub to Mitrovitza, 70 miles between Kulleli and Dageaghatche, 65 miles between Tirnova and Jamboli, 64 miles between Banjaluke and Novi, and 118 miles from Zenica to Brod. In Asia a line was running from Scutari to Adabazar, 92 miles in length, lines connecting Smyrna with Seraikeni, Alasher, and Sevdikeni, and one from Mersina to Adana, the aggregate length completed being 392 miles. The Anatolian Railroad, which is being built with German capital, was completed by May, 1891, and opened to traffic beyond Adabazar as far as Biledshik, 65 miles more. An English company has begun a railroad from Caiffa to Damascus, and another connecting Damascus with Beirut is being built by a French company. In Europe a railroad is being laid to connect Salonica with Monastir.

Creds and Nationalities.—The population of the immediate possessions of the Ottoman

Government is divided in respect to religion into about 16,000,000 Mohammedans and 6,000,000 Christians. In European Turkey one half of the people are Christians, in the Asiatic territories less than one sixth. The Mohammedan clergy number 11,600. There are 2,120 mosques, and connected with them 1,780 free elementary schools. The revenue of the Evkaf or religious establishment consists of about 20,000,000 piasters received from endowments and 7,000,000 piasters contributed by the state, which pays, moreover, 7,000,000 piasters to the Sheikh-ul-Islam and nearly 8,000,000 piasters for the support of the *naibs* and *muftis*, and gives a large sum annually (13,000,000 piasters in 1880) for the reading of the Koran, and as much more in aid of the pilgrimage to Mecca. The pilgrims in 1889 numbered 139,987, of whom 81,450 arrived by sea. About three quarters of the real property in the cities has been bequeathed to the Vacouf or mosque endowment. The Christians are divided into Greeks, Armenians, Latins or Franks, Syrians and United Chaldeans, Maronites, and Protestants. The last are converts made by missionaries, chiefly among the Armenians. The Franks are adherents of the Roman Catholic Church who have preserved the religion of the old Genoese and Venetian settlers.

The Greek and Armenian patriarchs and the chief rabbi of the Jews exercise a large degree of civil authority. The Greek patriarch was the ecclesiastical head of all the Orthodox Christians of the Turkish Empire until the Servians, Roumanians, and Bulgarians, after obtaining political autonomy, established autocephalous churches, which have gradually encroached on the ecclesiastical domain of the patriarchate within the present limits of Turkey. In resisting the transfer of the investiture of bishops in Macedonia to the Bulgarian exarch, the œcumenical patriarch demanded as compensation that certain rights and privileges held under the ancient ecclesiastical law should be restored to the Church. The Porte granted these concessions, extending considerably the autonomy of the Greek community. The solemnization and dissolution of marriages and the questions of dowries and allowances are to be dealt with by the patriarch and metropolitans, leaving the civil courts and executive authorities nothing to do but to record and enforce their decisions. Wills of Christians are judicially valid when attested by the bishops, and suits concerning wills and guardianship will be tried in the ecclesiastical courts, provided the heirs are members of the Orthodox Greek community and of Turkish nationality. In regard to education the patriarch or metropolitan has the right to decide on the course of study and to appoint teachers, but the Greek schools are subject to the inspection of the state educational authorities. Priests and Jewish rabbis are permitted to testify before their own ecclesiastical authorities, who will report the evidence to the civil courts. Priests arrested for debt will be tried by their ecclesiastical superiors; and when a priest is accused of a criminal offense the magistrate has to notify the bishop, and the latter to produce the accused, who will not be confined with ordinary prisoners pending his trial. These privileges were confirmed by an *irade* issued Feb. 5, 1891.

The Servian Government, in competing for influence in Macedonia with the Bulgarians, has maintained a college in Belgrade in which teachers are trained for work in that province, and has opened schools in places where there are few persons or none at all of Servian blood. They have been especially active in the vilayet of Monastir, and in July, 1891, the Governor-General of Macedonia, Paik Pasha, raised objections to this form of political propaganda. The Greeks, who once claimed as their own all the Christian populations of the Balkan peninsula, have seen the Servians, the Roumanians, and the Bulgarians fall away, and nationalism spring up in Albania. The latest desertion was that of the Zinzares of Monastir, who, owing to their wealth and intelligence, form an important element in the population of Macedonia. About fifteen years ago they learned that they were of Wallachian origin, and from that time they have joined their efforts to those of the Roumanian Government in reviving the Roumanian language and nationality by establishing schools and reading-rooms. The Roumanian Government has lately taken steps to obtain from the Porte for the Roumanians of Turkey the right to have an independent religious administration similar to that conceded to the Bulgarians in Macedonia, and the latter favor the establishment of a Roumanian episcopate at Mitrovitza, because it would be the natural ally of the exarchate in combating the pretensions of the Greek patriarchate and the Servian propaganda. In Albania and Epirus, as well as in Macedonia, the Wallachians, who formerly passed as Greeks, are asserting their nationality, and eagerly embracing the privilege of worshiping in the Roumanian tongue. In the summer of 1891 riotous conflicts took place in Monastir between Wallachians and Greeks, when the former availed themselves of the permission granted by the Porte to use their language in church services. Riots between Roman Catholics and Orthodox Greeks in Jerusalem called forth representations from the French and the Russian ambassadors at Constantinople, who avoided a controversy that might disturb their political co-operation by leaving the Turkish authorities to decide the rights of the case.

The Arnauts of the vilayet of Pristina, in Old Servia, having received no answer from the *va/i* to a demand for the restoration of certain ancient privileges, marched 2,000 strong into Drenitza on Feb. 2, 1891, under the leadership of Juril Beg, and after driving out the officials, police, and military, burned the Governor's konak and other Government buildings. Other acts of lawlessness were committed, but the Porte was reluctant to take vigorous measures for fear of provoking a new insurrection in Albania, and merely strengthened the garrisons and prepared for effective military action in case of necessity.

In December the Mallisoris, who had been accumulating Martini rifles through some mysterious channel, which they refused to surrender on the demand of the Turkish authorities, raided villages in the adjacent part of Servia. A league of chiefs was formed by Cassas Effendi for the restoration of the feudal rights to raise and command the troops from Albania. A general amnesty to all persons implicated in the Arne-

nian agitation was proclaimed by the Sultan, and some hundred prisoners were released on Jan. 17, 1891. The amnesty was accompanied with a promise that if, in the future, the Armenians should have any cause of complaint, they would receive justice and satisfaction by appealing to the Sultan through their patriarch.

Brigandage.—On May 30, 1891, a band of brigands, led by Anastatius, a Greek, tore up some rails of the Oriental Railroad at Teherkeskeui, half-way between Adrianople and Constantinople and about 60 miles from Constantinople, upsetting a train. After robbing the passengers they carried off to the mountains those who were traveling in the first-class carriages, who happened to be German tourists, one of whom, a Berlin manufacturer named Israel, they sent back with a letter demanding 200,000 francs. The German embassy promptly sent the ransom, exacting repayment from the Turkish Government. The captives, who were set at liberty after a detention of nine days, were well treated by the bandits, who numbered about 30, all Greeks. For the suppression of brigandage the garrisons in the province of Adrianople were greatly strengthened, and more vigilant commanders and civil officials were appointed. At Ormudja, not far from the place of the railroad robbery, Eugène de Raymond, manager of a large vineyard in the neighborhood, was carried off by another band of Greek brigands, his companion being released in order to convey the message demanding a ransom of 5,000 liras. The Turkish Government, on the demand of the French ambassador, sent the ransom to Thomas, the brigand chief, and secured the prisoner's release. These successes encouraged other robbers. An Italian railroad official on the Salonica-Uskub line of railroad was carried off by brigands. An encounter between brigands who had laid an ambush for a grain merchant and a company of Turkish gendarmes sent in pursuit of them occurred in September, not far from Adrianople, and the brigands were captured after killing several gendarmes. In consequence of the brigand outbreaks the Oriental Railroad Company demanded special guarantees from the Porte.

Change of Ministers.—On March 17, 1891, Agop Pasha, Minister of Finance, resigned and was succeeded by Nazif Effendi, while still remaining Minister of the Civil List. On Sept. 3, 1891, Kiamil Pasha, the Grand Vizier, was dismissed by the Sultan, and all the ministers with him, except those of Marine, Foreign Affairs, and Justice. Djavad Pasha, Governor of Crete, was appointed Grand Vizier, Djemal Eddin was named Sheikh-ul-Islam, and the following ministerial appointments were made: Said Pasha, Minister of Foreign Affairs and President of the Council of State; Riza Pasha, who was commandant at the Yildiz Kiosk, Minister of War; Hassan Pasha, Minister of Marine; H. Rifot Pasha, Governor of Smyrna, to be Minister of the Interior; Ghalib Pasha, Governor of Salonica, to be Minister of Evkafs; Zuhdi Pasha, Minister of Education; Riza Pasha, Minister of Justice; Mahmoud Pasha, Governor of Brussa, to be Minister of Public Works, Commerce, and Agriculture; Nazif Effendi, Minister of Finance; Mikael Effendi Portokal, Minister of the Civil List. On Sept. 10, Mahmoud Pasha having been

appointed Governor-General of Crete, his place in the Cabinet was filled by the appointment of Gen. Tewfik Pasha, ex-Minister to Washington and ex-Minister of Finance, as Minister of Public Works, Commerce, and Agriculture.

The Question of the Dardanelles.—The change of ministry was supposed to indicate an abandonment of the Anglophile policy of Kiamil Pasha in consequence of the Franco-Russian alliance, and a tendency to rely on the Russians and French to back the Porte against England and the central powers in the bolder assertion of the sovereign rights of the Sultan in Egypt and Bosnia and Herzegovina. The first manifestation of this change of attitude was the granting of permission to the steamers of the Russian volunteer fleet to pass through the Dardanelles and convey soldiers destined for or returning from the Russian possessions in eastern Asia. This fleet, of 8 vessels, which are now used as transports between Russia and the penal colony on the island of Saghalien, was first created at the time of the Afghan crisis of 1885, and the vessels were intended to be used as swift cruisers in the expected war with England. As a warning against further concessions to Russia, the English naval forces made a landing at Sigri, on the island of Mitylene, which is near the mouth of the Dardanelles, though not ostensibly as a hostile demonstration. The Porte had issued a circular note refusing permission to foreign war vessels to execute manœuvres within 15 marine miles of the Turkish coast, being influenced by representations made by the Russian ambassador regarding manœuvres carried out by the strong English squadron of 15 vessels collected in Turkish waters on the islands of Samothrace, Lesbos, Lemnos, and Tenedos. Notwithstanding this prohibition, the British admiral, within two weeks, on Sept. 13, landed a force on the islet of Sigri, sank torpedoes in the harbor, and carried out a series of mock naval operations, for which the British ambassador was afterward called upon by the Porte to give an explanation. In a circular sent by the Porte to its representatives abroad concerning the Dardanelles question it was pointed out that the vessels of the Russian volunteer fleet had been running for several years between Odessa and Vladivostock, and had been granted free passage through the Dardanelles, as they sailed under the commercial flag. Because they sometimes carried convicts, with their military guards, and brought back time-expired soldiers, the Turkish authorities had sometimes detained them by mistake. To avoid the possibility of similar misunderstandings in the future, an arrangement had been made with Russia which defined the rights of the vessels under the old treaty, but introduced no new principle.

Insurrection in Arabia.—The Sultan was influenced to adopt the policy of leaning on Russia and France and opposition to England partly by a formidable insurrection that broke out among the Assyrs, the most powerful tribe in the Yemen province, which threatened to spread to all the other tribes of the country. The Arabs in their refusal to acknowledge the caliphate of the Sultan are at all times hostile to the Turks on religious grounds, which have been immensely strengthened in consequence of the British occu-

pation of Egypt. The rebels of Yemen were furnished with repeating rifles and Hotchkiss guns, and as they could only have obtained these through British instrumentality the Sultan suspected that the English Government, for some unknown object, had incited or connived in the uprising. The southwestern province of Arabia, known as Yemen or the vilayet of Sana, is a rich agricultural region, producing the famous Mocha coffee and tobacco of excellent quality, as well as cinnamon and other spices. The people expelled the conquerors in 1630, and Turkish rule was not re-established till 1872. The government of a Turkish vilayet was organized at Sana, and for a time the customs duties collected at Hodeida and Mocha were sufficient to support the local administration and furnish a considerable surplus for the Government at Constantinople. These tariffs, however, hastened the decline of the trade, which had already begun to leave these ports for Aden, and the governors were obliged to levy a land tax and other direct taxes which the people were unwilling to pay. Several local disturbances occurred, and these the pashas were restrained from putting down by energetic means, because the Sultan was anxious to preserve his character as the benevolent caliph of the Arabian tribes. When the spirit of revolt became rampant and the Turkish authorities were obliged to resort to active measures, the military force at their command was insufficient in numbers, and the troops that were there, neglected and unpaid, badly nourished, ragged, and suffering from climatic conditions, had neither the heart nor the ability to perform the service that Turkish soldiers seldom fail in. Thus it happened that Nizams were more than once defeated by Arab tribesmen. In June it was known that the rebellion had reached a serious stage, and that the local forces were beaten and demoralized. The Sultan and his advisers were in consternation, fearing lest the movement should spread to Hedjaz, and the Grand Shereef of Mecca be tempted to head the rebellion and proclaim Arabian independence. Orders were given to dispatch an army of 10,000 men from Syria to the disturbed province. From lack of funds and equipments, it was found to be impossible to mobilize so large a force. Therefore the command was rescinded, and the expedition was limited to two battalions, or 2,000 men, who left Constantinople in steamers, accompanied by 80 cavalry and 150 artillery, with 6 guns. The expeditionary force, though it gained some successes over the Assyrs, proved quite inadequate, and in July the governor, Redjeb Pasha, who had been transferred from Bagdad, where he commanded the troops, to replace Hakki Pasha, sent urgent appeals for re-enforcements. The rebels remained on the defensive and the Ottoman troops were afraid to attack. The soldiers were enervated by the excessive heat and in dread of cholera, which was raging in Hedjaz. Many of the soldiers were Arabs, who sympathized with the insurgents. A column which left Sana on July 19 had several engagements with the rebels, and suffered severe loss on the march to Hadje, which the rebels had laid in ruins. A new *vahi* was appointed, Hassan Edib Pasha, who, with Gen. Ahmed Rushdi Pasha, undertook a movement against Kufle and Hadje,

which was unsuccessful. The whole country north of Sana and Hodeida was in open revolt, and the tribes of the south, with the exception of a part of the Dihama Arabs, were in sympathy with the rebels. Re-enforcements were sent in small detachments. Edib Pasha, with the garrison of 5,000 men, was besieged in Sana by the Sheikh Hamed Eddin at the head of 35,000 armed rebels. Edib Pasha, who had been appointed for the purpose of pacifying, not fighting, the Arabs, was relieved of the command and superseded as vali by Feizy Pasha. Four battalions embarked from Constantinople in steamers, and other transports collected Redifs at Smyrna, Beirut, and Dageaghatch sufficient to complete twelve battalions. The rebels retired from before Sana and Hodeida on the arrival of

the Turkish re-enforcements. In the territory of the Beni Sahar and Housseyn tribes they intrenched themselves in the fortified towns of Barath, El Charab, El Rhail, and March. The Turkish commander-in-chief said that he could not suppress the rebellion with less than 40,000 men. Hamid Eddin returned to the siege of Sana, and demanded as his terms of peace that the whole population should be exempt from taxation for five years, that the exorbitant taxes hitherto collected should then be reduced, that natives should be selected for judges, and that a native of the province should be appointed vali. Though no terms of peace were settled, the siege was again raised. After many weeks of inaction the rebels again marched on Sana, and the Turks made ready to meet them.

U

UNITARIANS. American Unitarian Association.—The sixty-sixth annual meeting of the American Unitarian Association was held in Boston, Mass., May 26. The Hon. George S. Hale presided. The treasurer's report showed that 272 churches out of the 426 churches of the Unitarian societies had contributed to the funds of the association about \$54,000. This had all been spent, with the addition of \$20,000 from the general fund, in the prosecution of the work of the society. The report of the Board of Directors spoke of the increasing breadth, variety, and amount of the work of the association, which now included Hungary and Japan, and extended on the American continent from Winnipeg on the north to the Gulf of Mexico on the south. It maintained, warmed, and lighted headquarters in Boston for the use of the whole denomination; furnished its literature to all who asked for it; supported preaching in college towns; kept in existence about twenty old and feeble societies; aided new societies in all stages of their growth; helped young men to enter the ministry; was engaged in work abroad; maintained missionary superintendents in the field; helped the social and reformatory societies connected with the several parishes; managed a church building fund; and promoted educational and civilizing work in the South and among the Indian tribes. The association pays \$500 annually toward the support of a church in Budapesth, Hungary, and the British and Foreign Unitarian Association does the same. This society had grown steadily in numbers and strength, had gathered five "sister churches" around itself, and had within the year erected a fine church building. The mission in Japan had resulted in the formation of a Japanese Unitarian association, of which many of the people had become members. Several religious societies akin to the Unitarian parishes had been gathered, and three Japanese had become preachers of the Liberal faith. The Montana Industrial School among the Crow Indians had fifty-four pupils. Considerable money and a large number of books for work among the colored people, especially at Tuskegee School, had been forwarded during the year.

National Conference.—The fourteenth session of the National Conference of Unitarian and other Christian churches was held at Saratoga, N. Y., September 21 to 24. Mr. George William Curtis presided. The functions of this body are purely advisory, but it is affiliated with the several special organizations and benevolent and missionary enterprises of the Unitarian churches, and receives their reports. Reports were received from the council, reviewing the work of the Unitarian churches at large; from the American Unitarian Association; from the Women's National Alliance; from local superintendents or conferences on church extension; from the Meadville Theological School, Pa.; from the Japan Mission; and from the committee of the Conference on Christian Fellowship. The last committee reported rules for insertion in the by-laws, which were unanimously adopted, directing that "the Fellowship Committee shall include in its scope the extending of fellowship to ministers from other countries coming to America and desiring to engage in ministerial work among our Unitarian Churches," and that "no one admitted by the Fellowship Committee shall be entitled to claim insertion in the list of ministers until after being settled in some parish or other regular ministerial employment for at least one year." The missionary work of the Universalists in Japan was recognized as kindred with that of the Unitarians; assurances of regard and sympathy were conveyed to the ministers and churches of that denomination. The desire was expressed for increased acquaintance and closer co-operation with them, and concurrence was pledged with any arrangements that may be made for co-operation with the Universalist missionaries or the German Liberal brethren laboring in Japan. The next meeting of the conference having been appointed to be held in Chicago during the Exhibition of 1893, a recommendation was made that that session be as far as possible an International Unitarian Conference, in which the co-operation of all foreign Unitarian organizations as well as of those at home was invited. The liquor saloon being declared by resolution the nation's chief source of crime, chief college of corruption in politics,

etc., and no method of dealing with it being regarded as efficient unless those who condemn it consent themselves to abstain totally from the use of alcoholic drink for pleasure, all persons in the denomination were exhorted to become total abstainers and throw the solid influence of the Church against the saloon. The proposed publication of a "Quarterly Review of Religion and Theology" to succeed the present "Unitarian Review" was approved. Memorial resolutions were passed concerning Mr. Justice Samuel F. Miller and the Hon. Hannibal Hamlin.

Unitarian Sunday-School Society.—The annual meeting of the Unitarian Sunday-school Society was held in Fitchburg, Mass., Oct. 28 and 29. The receipts for the year had been \$13,785, and the society held funds to the amount of \$19,785. The society corresponds with Sunday-school workers in the United States and foreign lands; assists new and feeble Sunday-schools; furnishes its publications to Sunday-schools, theological schools, and other institutions, and is publishing a series of Sunday-school texts, of which several thousand copies have been distributed, and a Sunday-school paper.

UNITED STATES. The Administration and the Judiciary.—By the death of William Windom, on Jan. 29, 1891, the post of Secretary of the Treasury was left vacant. On Feb. 7, Secretary Noble held a conference, in Washington, with a delegation of the Sioux Indians who had surrendered. The decision of the President and Secretary of War, sustaining Col. Forsyth's dispositions at the Wounded Knee engagement, was announced on Feb. 12. On Feb. 21 the President sent to the Senate the nomination of ex-Governor Charles Foster, of Ohio, to be Secretary of the Treasury, and that of Martin A. Knapp, of New York, as Interstate Commerce Commissioner. The nomination of Mr. Foster was confirmed on Feb. 24 by a unanimous vote.

The appointments of Senator Blair, of New Hampshire, as minister plenipotentiary and envoy extraordinary to China, of Truxton Beale, of California, as minister to Persia, and of Martin A. Knapp as Interstate Commerce Commissioner, were confirmed by the Senate on Feb. 27. The Secretary of the Navy formally accepted the cruisers "Philadelphia" and "San Francisco" on March 6. On March 7 the President appointed James H. Beatty district judge for Idaho. An order of Gen. Ordway disbanding the colored militia of the District of Columbia was rescinded by the President on March 14.

On March 30 ex-Representative T. H. Carter, of Montana, was appointed Commissioner of the General Land Office. The free-sugar clause of the new tariff act and the new immigration law both went into effect on April 1, and the international copyright law on July 1, when the President issued a proclamation declaring its application to the countries that had fulfilled the specified conditions, viz., Belgium, France, Great Britain, and Switzerland. A decision of Judge Hanford, of the United States district court in the State of Washington, was delivered on Aug. 19, in accordance with which Chinamen entering the United States in violation of the exclusion acts by way of Canada must be returned to Canada, and not to China, as was the practice before. In the beginning of August Joel B. Er-

hardt resigned the post of collector of the port at New York on account of differences with the officials at Washington regarding removals and the details of administration. J. Sloat Fassett, who was appointed to succeed him, resigned also on Sept. 11, having received the Republican nomination for Governor of New York on Sept. 9, and Francis Hendricks was appointed as his successor on Sept. 16. On Sept. 9 ex-Judge Thomas M. Cooley, of Michigan, retired on account of failing health from the Interstate Commerce Commission, of which he had been chairman from the beginning.

On Sept. 18, President Harrison issued a proclamation declaring the lands ceded to the Government by the Indians forming the eastern part of Oklahoma to be open to settlement and homestead pre-emption on Sept. 22, and on that date about 60,000 persons entered the reservation. In October Charles J. Murphy went to Berlin as a special agent of the Agricultural Department for the purpose of calling the attention of the German Government to the food value of Indian corn. On the retirement of Secretary Redfield Proctor, who was appointed by Gov. Paige, of Vermont, to serve out the unex-

CHARLES FOSTER was born near Tiffin, Ohio, April 12, 1828. He was taken as a child of five to this remote settlement where the town of Fostoria now stands, was sent to the Norwalk Academy to be educated, entered on a mercantile career, and when he had become an active and wealthy merchant he interested himself in party politics as a Republican, but sought no public office till 1870, when he allowed himself to be nominated as a candidate for Congress, and was elected through his personal popularity, and three times re-elected, although in his district the Democrats were in the majority. He was appointed on the Committee of Ways and Means, and in this position was instrumental in bringing to light the Sanborn frauds and in securing the repeal of the moiety law. As chairman of the visiting committee in New Orleans to examine into electoral frauds in 1874 he drew up a report denouncing the acts of both parties. In 1879 he was elected Governor of his State, and in 1881 was re-elected, holding office till January, 1884. In his messages to the Legislature he recommended the regulation of liquor selling by high license or local option or its entire prohibition.

He served a term in the United States Senate of G. F. Edmunds, Stephen B. Elkins, of New York, was appointed Secretary of War, and on Dec. 22 his appointment was confirmed by the Senate. He entered on the duties of the office on Dec. 24.

The Post-Office.—The number of post-offices on June 30, 1891, was 64,329, of which 2,942 were presidential and 61,387 fourth-class offices. The post routes had an aggregate length of 439,027 miles, as compared with 427,027 in the preceding year. The post-office revenue during the fiscal year was \$65,931,786, and the expenditure \$71,662,463. The aggregate sum paid in salaries to postmasters was \$14,527,000, and the expenses of transportation of mails were \$36,805,621.

STEPHEN B. ELKINS was born in Virginia in 1841, and when three years old was taken to Westport, now a part of Kansas City. He was educated in the University of Missouri at Columbia, where he was graduated in 1860. Although his father and brother joined the Confederate army, he remained true to the Union, and fought on the Federal side as captain of militia at the battle of Lone Jack. The barbarities of the ferocious guerilla warfare, in which old friends and neighbors were on the opposite side, impelled him to resign his commission. He crossed the plains in 1863 to Albuquerque, New Mexico, and from there he went to Mesilla, where he began to practice law, which he had studied without a preceptor since leaving college, with the intention of practicing in St. Louis. Cases were given to him, and he therefore remained, learned Spanish thoroughly, was elected to the Territorial Legislature in 1864, settled in Santa Fé, obtained a lucrative practice in land cases, and established a bank. In 1873 he was elected a Delegate to Congress, having before that been Attorney-General of New Mexico and United States Attorney for the Territory, in which capacity he secured the application of the law against involuntary servitude to peonage, and sued out writs of *habeas corpus* in the cases of 2,000 persons who were held to service for debt. He won a reputation by his speech in favor of the admission of New Mexico as a State, and his motion was carried in the House of Representatives. He was continued in Congress for another term after which he declined re-election. Settling in New York, he engaged in financial operations in connection with the lands he had acquired in New Mexico, and with coal mines, forests, and railroads belonging to his father-in-law, Senator Davis, and himself in West Virginia. He acquired interests in other railroads, street railroads, and various large enterprises, and had a large share in directing the electoral campaigns of the Republican party, of which he has been a member since its organization in New Mexico.

The Patent Office.—The number of applications filed in the Patent Office during the fiscal year 1890-'91, including 2,333 caveats, was 45,949, of which 39,696 were for new patents, 111 for re-issues, 1,146 for designs, 1,855 for registration of trade-marks, 808 for registration of labels. The number of patents granted, including re-issues and designs, was 25,307, the number of trade-marks registered was 1,744, and the number of labels was 289, making a total of 27,-

340. There were 3,514 patents withdrawn, for non-payment of the final fees. The number of patents that expired during the year was 12,876. The receipts for the twelve months were \$1,027,795, and the expenditures were \$1,145,564.

Public Lands.—During 1890-'91 the number of acres entered under the Homestead act was 5,040,393, and the number taken up under the Timber-culture act 969,006. The vacant land on June 30, 1891, had a total area of 579,664,083 acres, of which 285,280,251 acres had been surveyed and 294,027,773 were unsurveyed.

The Coast and Geodetic Survey.—Advantage was taken by the Superintendent of the Coast and Geodetic Survey of opportunities afforded by his visit of inspection to the Pacific coast to determine gravity with new and improved apparatus at a number of stations in California, Washington, and Alaska. In compliance with a request from the International Geodetic Association, and with the sanction of the Secretary of the Treasury, an officer of the survey was instructed to proceed to the Hawaiian Islands and aid an officer detailed by that association in observations relating to the variations of latitude. He was further directed to determine simultaneously with latitude the force of gravity at sea level, and also, when practicable, near the summit of Mauna Kea. The demand for the charts of the survey has for some years past exceeded the capacity of the office presses, but new presses and increased working room, soon to become available, will probably enable all public requirements to be met. A new building, more perfectly adapted to the needs of the Coast and Geodetic Survey, Secretary Foster recommended to have erected in Washington.

Pensions.—The disbursements on account of military pensions during the year ending June 30, 1891, were \$118,548,959, against \$106,493,890 in 1890, \$89,131,968 in 1889, \$79,646,176 in 1888, \$74,815,486 in 1887, \$64,584,270 in 1886, \$65,693,706 in 1885, and \$57,273,536 in 1884. The total sum paid out in pensions since 1861 is \$1,277,261,263. The number of pensioners on the rolls on June 30, 1891, was 676,160, of whom 536,811 received invalid pensions and 139,339 were widows and others. The number of claims allowed during the twelve months was 156,486, including 88,611 invalids and 13,776 widows claiming pensions under the act of June 27, 1890, and 336 survivors and 385 widows of veterans of the war with Mexico. The number of applications filed during 1890-'91 was 363,799, in addition to which there were 353,582 applications under the act of June 27, 1890, from persons who were already pensioners or applicants for pensions. The pensioners on the rolls on June 30, 1891, drawing pensions under the general law, included 313,597 invalids and 106,560 widows, etc., of the army, and 45,449 invalids and 2,568 widows, etc., of the navy. Under the act of June 27, 1890, there were 97,137 invalids and 12,209 widows, etc., of the army and 3,976 invalids and 1,436 widows of the navy admitted to the rolls. The number of veterans drawing pensions for services in the War of 1812 was 284, and the number of widows of soldiers of 1812 was 7,590. The pensioners of the war with Mexico numbered 16,379, and the number of pensioned widows was 6,976. There were 20 widows

of soldiers of the Revolution drawing pensions, the youngest seventy-three and the oldest ninety-nine years old. There were 222,521 first payments of pensions during the year, requiring \$38,522,274, which was \$69,592 less than the 130,514 first payments in 1889-'90, the average being \$485 in 1890 and only \$239 in 1891. The first payments on claims under the act of June 27, 1890, averaged \$71.

Indians.—The Indian population, exclusive of natives of Alaska, was 250,483 in 1891. The number of Indian youths enrolled has increased, as has also the average daily attendance in the schools. The Indians have consented, as a rule, to send their children to schools, and it has not been found necessary to take immediate compulsory measures to secure their attendance, as authorized by the act of March 3, 1891.

Political Conventions.—At a conference of representatives of the Farmers' Alliance and industrial organizations held at Cincinnati on May 19, the People's party was founded. Resolutions were adopted convoking a conference of "all progressive organizations" at Cincinnati on Feb. 22, 1892, and a national committee was appointed which was authorized, if no satisfactory coalition with other reform organizations could be effected, to call a convention of the People's party for the nomination of a President, to be held not later than June 14, 1892. On Nov. 23 the Republican National Committee, at Washington, selected Minneapolis for the place of meeting for the national convention and, appointed June 7, 1892, as the date. The National Committee of the Prohibition party met at Chicago on Dec. 17, 1891, and agreed on St. Louis as the place for holding a national convention, which will meet on June 29 and 30, 1892, for the purpose of nominating candidates for the presidency and vice-presidency of the United States.

The following was adopted, on May 20, by the conference at Cincinnati, as the platform of the new third party, to be called the People's party:

That we most heartily indorse the demands of the platforms as adopted at St. Louis, Mo., in 1889, Ocala, Fla., in 1890, and Omaha, Neb., in 1891, by industrial organizations there represented, summarized as follows:

The right to make and issue money is a sovereign power to be maintained by the people for the common benefit, hence we demand the abolition of national banks as banks of issue, and as a substitute for national bank notes we demand that legal-tender treasury notes be issued in sufficient volume to transact the business of the country on a cash basis, without damage or especial advantage to any class or calling, such notes to be legal tender in payment of all debts, public and private, and such notes when demanded by the people shall be loaned to them at not more than 2 per cent. per annum upon non-perishable products, as indicated in the sub-treasury plan, and also upon real estate, with proper limitation upon the quantity of land and amount of money.

We demand the free, unlimited coinage of silver.

We demand the passage of laws prohibiting alien ownership of land, and that Congress take prompt action to devise some plan to obtain all lands now owned by alien and foreign syndicates, and that all land held by railroads and other corporations in excess of such as is actually used and needed by them be reclaimed by the Government and held for actual settlers only.

We demand a just and equitable system of graduated tax on income.

We demand the most rigid, honest, and just national control and supervision of the means of public communication and transportation, and if this control and supervision does not remove the abuses now existing, we demand the Government ownership of such means of communication and transportation.

We demand the election of President, Vice-President, and United States Senators by a direct vote of the people.

The following additional resolutions, not a part of the platform, were also adopted:

That while the party in power in 1869 pledged the faith of the nation to pay a debt in coin that had been contracted in a depreciated currency basis and payable in currency, thus adding nearly one billion dollars to the burdens of the people, which meant gold for the bondholders and depreciated currency for the soldier, and holding that the men who imperiled their lives to save the life of a nation should have been paid in money as good as that paid to the bondholders, we demand the issue of legal-tender treasury notes in sufficient amount to make the pay of the soldiers equal to par with coin, or such other legislation as shall do equal and exact justice to the Union soldiers of this country.

That as eight hours constitute a legal day's work for Government employes in mechanical departments, we believe this principle should be further extended so as to apply to all corporations employing labor in the different States of the Union.

Reciprocity Treaties.—The first treaty of commercial reciprocity concluded in accordance with the clause of the Tariff act of Oct. 1, 1890, providing for the admission into the United States free of duty of sugar, molasses, coffee, tea, and hides in return for reciprocal concessions, was signed with Brazil on Feb. 5, 1891 (see BRAZIL). Arrangements with Great Britain in respect to the free importation of products of Jamaica, the Leeward and Windward Islands, Barbados, and British Guiana were finally concluded in December, 1891. A treaty was concluded with Spain for Cuba and Porto Rico, and promulgated in a proclamation issued by President Harrison on Aug. 1, under which salt meats, lard, hay, resin, cotton, crude petroleum, coal, oats, barley, rye, buckwheat, fruit, lumber, manufactures of iron, sewing machines, and other articles are admitted into those colonies free of duty, and refined petroleum, wheat and flour, boots and shoes, corn, and many other American products at reduced rates of duty. Treaties with Salvador and Guatemala, providing for practical free trade in American products, were signed in December. A liberal arrangement was also made with Santo Domingo. The English treaty goes into effect with British Guiana on March 31, 1892, and with the other colonies two months earlier. In the convention with regard to Jamaica many commodities of prime commercial importance, and in all 63 articles, are exempted from duties, and 12 others are admitted into that island at reduced rates. In the other colonies 58 articles are transferred to the free list, and duties are lowered for 16 others. Negotiations with Germany, France, Belgium, Italy, and other European countries resulted in the removal of the prohibition of pork imports, in consideration of their admission to the reciprocity clause, taken in conjunction with the new meat inspection law. Before the end of the year reciprocity arrangements had been made with all the Spanish

American countries excepting Chili, Colombia, Hayti, Honduras, Nicaragua, and Venezuela, and with European countries with the exception of Austria-Hungary, and of Spain in respect to the Philippine Islands. For countries that do not amend the duties that are considered by the President to be reciprocally unequal and unreasonable before March 15, 1892, raw sugar imported from them is subject to a duty of $\frac{7}{10}$ cent a pound, sugar under 16 and above 13 Dutch standard to $1\frac{1}{2}$ cent, sugar above 16 and under 20 to $1\frac{1}{2}$ cent, sugar above 20 to 2 cents, molasses to 4 cents a gallon, coffee to 3 cents a pound, tea to 10 cents a pound, and hides to $1\frac{1}{2}$ cent a pound. In the reciprocity agreement with Germany the reductions of duty conceded in the new commercial treaties between Germany and the Austro-Hungarian monarchy and Switzerland are extended to the United States also, chief of which are reductions of 30 per cent. on wheat and rye, $37\frac{1}{2}$ per cent. on oats, 11 per cent. on barley, and 20 per cent. on Indian corn, one of 30 per cent. on hogs, 15 per cent. lower duties on butter and fresh pork, and reductions on mill products and on lumber and timber, the latter of from $16\frac{1}{2}$ to 25 per cent.

The New Orleans Affair.—On Oct. 15, 1890, David C. Hennessy, chief of the New Orleans police force, was shot near his own door at night and died without being able to say anything more than that "Dagos" had shot him. Many murders and assaults had been committed by Italians upon each other in New Orleans, and in most cases the perpetrators had escaped detection. Chief Hennessy had been instrumental in the extradition of Esposito, a fugitive Italian bandit, and had more recently been active in arresting and finding evidence against six members of a gang of Italian longshoremen called the Provenzanos, who were awaiting their final trial on the charge of firing from an ambush on a party of Matrangas, another band who were their rivals in the business of unloading fruit steamers. The murder of the police officer caused intense excitement. The working people were hostile to the Italians, who were their competitors in various trades, and all classes were shocked by their many crimes of violence. This last murder confirmed the popular belief that there was a "Mafia" or oath-bound society for assassination. On Nov. 20 the Grand Jury returned an indictment of murder against eleven persons, and eight were indicted as accessories before the fact. The acquittal of the Provenzanos who were tried for shooting the Matrangas, strengthened the general belief that it was impossible to convict Sicilians, because they were bound by oaths to save each other by perjured testimony. The District-Attorney, on Feb. 6, 1891, arraigned six of the persons indicted for the murder of Hennessy and three of those indicted as accessories. A jury was selected from among 1,375 persons, and after a trial during which 67 witnesses appeared for the State and 84 for the defense, a verdict of acquittal was rendered in the cases of six of the accused, two of whom the judge had directed the jury to acquit, and in the other three cases a mistrial was entered. The verdict was denounced as contrary to the evidence, and the jurors were generally believed to have been bribed, a private

detective, D. C. O'Malley, being suspected as the agent of the "Mafia" employed to fix the jury. Members of a committee of 50 appointed to co-operate with the authorities in detecting and bringing to punishment the assassins of Hennessy did much to stimulate the popular frenzy, and on March 14 some of them led a mob which broke into the parish jail and lynched the eleven Sicilians confined there, including those who had been acquitted. On the day of the massacre Baron Fava, Italian minister at Washington, on cabled instructions from the Marquis di Rudini, delivered a written formal protest to Mr. Blaine, who expressed horror at the occurrence. Secretary Blaine telegraphed to Gov. Nichols of Louisiana, urging that the violators of the law should be brought to justice. The Governor in his answer justified the deed. On March 16 Baron Fava had an interview with the Secretary of State, who, in reply to his renewed protest against the inaction of the local authorities, reminded him that the officers of the Federal Government had no constitutional power of interference with the administration of justice in any State, and could do no more than entertain a claim for indemnity. The Italian Premier, who in his first cablegrams had directed Baron Fava to denounce the grave deed to the Government and urge repressive and protective measures, and to protest formally should there be any hesitation, while he reserved for himself the right of asking for proper satisfaction, on receiving a dispatch from Consul Corte in New Orleans saying that the murderers would be handed over to the judicial authorities, telegraphed, on March 19, that it was indispensable that the United States Government should inform him of such action, and instructed Minister Fava to present a demand for indemnity, adding that simple declarations, though cordial and friendly, can not prove as sufficient a satisfaction as can be shown in positive and concrete facts. The claims for indemnity advanced by the Italian Government covered the cases of three of the murdered Sicilians, who were Italian subjects, the others having been proved to be naturalized American citizens, except one other whose Italian citizenship was alleged subsequently. Secretary Blaine asked to have particulars given regarding the families of these three. A letter from Consul Corte to Minister Fava confirmed the impression felt in Italy that the local authorities had been very negligent. Consul Corte said that there were bad men among the Italians who were lynched, but that many of the charges made against them were without foundation. The lynching was foretold and could have been prevented by the removal of the prisoners when a violent anti-Italian demonstration occurred on the evening before, or even if the authorities had ordered the lynchers to disperse when they assembled armed with Winchester rifles. He inferred that the authorities consented to the massacre, if they did not instigate it. When he heard of the meeting of the lynchers he could not find the Mayor, without whose authority, the Attorney-General and the Deputy Sheriff of the prison told him, nothing could be done. He found Gov. Nichols with the commandant of the troops, and when he requested that military or

police be sent to prevent a massacre, the Governor said that he could not act without the Mayor. The massacre then occurred, and the consul and his secretary, who hurried to the prison, were mobbed and assaulted. Baron Fava, on March 21, in a note to Secretary Blaine, who was sick at the time, insisted that the assassins of the Italians should be indicted and that reparation be made to the families of the victims. On March 24 he received a telegram from the Marquis di Rudini saying that public opinion in Italy was impatient; that there could be no question regarding the right of the Italian Government to ask for an indemnity for the murdered men's families and to "ask and obtain the punishment" of the men that had assassinated three Italian subjects who had been declared innocent and discharged by an American magistrate; and that, should a definite decision be delayed, he would be under the painful necessity of openly demonstrating the dissatisfaction of the Italian Government by recalling the minister. On March 25, after receiving a dispatch saying that no further delay could be admitted after the direct and legitimate demands of the Italian Government, he obtained an interview with Secretary Blaine, who said that it was absolutely impossible for the Federal Government to interfere with the administration of justice. Early in the controversy Mr. Blaine pointed out the unreasonableness of the Italian Government in demanding the punishment of the lynchers, since in no civilized government can the executive authority go further than institute judicial proceedings against suspected criminals. This was the function of the municipal authorities of Louisiana, where the courts were open to Italians and Americans alike. This fulfills the conditions of the treaty of commerce and navigation concluded with Italy in 1871, which provides that "the citizens of each of the high contracting parties shall receive in the States and Territories of the other the most constant protection and security for their persons and property, and shall enjoy in this respect the same rights and privileges as are or shall be granted to the natives, on their submitting themselves to the conditions imposed on the natives." In one of his notes he took the ground that "the foreign resident must be content in such cases to share the same redress that is offered by the law to the citizen, and has no just cause of complaint, or right to ask the interposition of his country, if the courts are equally open to him for the redress of his injuries."

In the course of the controversy he treated the subject of indemnification of the families of the murdered Italians by the Federal Government not as a right established by international law, but as a matter open to discussion or the subject of a friendly understanding. In the interview of March 25 he asked if the Italian Government expected the Federal authorities to interfere with the States, expressing astonishment that Baron Fava, who knew the nature of the United States Constitution, should be the bearer of such a demand. The Italian minister said that they hoped that the President and Gov. Nichols would combine in bringing the culprits to justice. The Secretary answered that it was impossible for the Federal Government to act in the matter, where-

upon the Italian minister exhibited a dispatch from the Marquis di Rudini recalling him in case he failed to obtain redress. On the following day another dispatch was received by him authorizing him, in the event of the refusal of the Federal Government to give the assurance that indemnity would be granted and judicial proceedings instituted, to "affirm the inutilty of his presence near a government that has no power to guarantee such justice as with us is administered equally in favor of citizens of all nationalities." After consulting with the President, Mr. Blaine saw Baron Fava on March 26, and complained that the Marquis di Rudini was hurrying him in a manner contrary to diplomatic usage, and that he could announce no decision until he had investigated the cases of the Italian subjects who were alleged to have been massacred. He said that the Federal Government could not give the assurances demanded. "I do not recognize the right of any government," he said, "to tell the United States what it shall do; we have never received orders from any foreign power, and shall not begin now." He declared that it was "a matter of indifference what persons in Italy may think of our institutions," adding, "I can not change them, still less violate them." He affirmed that the treaty guarantees to Italian subjects the same protection enjoyed by American citizens, and asked if the Italian minister desired that they should have more protection; to which Baron Fava replied that his Government was entitled to demand for Italians in America the same degree of protection that is guaranteed to Americans in Italy. On March 27 the Marquis di Rudini sent an ultimatum announcing the departure of the Italian minister in the event of his failing to obtain a guarantee from the Federal Government that an indemnity would be paid and the culprits tried. He obtained from Mr. Blaine a written declaration acknowledging "the full obligation of the United States as regards full reparation for any violation of the treaty between the two countries which may have occurred," to which was added the explanatory statement that "no full examination of the case had been made, and the law officers of the Federal Government have not arrived at any decision." Deeming this insufficient, he announced his departure on March 31, and took leave of President Harrison, who expressed grief at the incident in New Orleans, and a hope that the guilty parties would be punished.

The Seal Question.—In March, 1891, Mr. Blaine proposed, as a *modus vivendi* that would prevent the destruction of the fur seals of the Pribiloff Islands by Canadian poachers before an agreement could be reached regarding the right claimed by the United States to police Bering Sea and suppress pelagic sealing, that a close season should be declared for the summer of 1891. Pending the decision of the British Government on the subject of a *modus vivendi* the Secretary of the Treasury issued orders to restrict the number of seals to be killed by the lessees of the islands—the North American Commercial Company—to the maximum of 60,000, subject to the discretion of an agent of the Treasury to limit the killing to as small a number as the condition of the herd might demand. Lord Salisbury declined to accept the proposition at

first, as he had when a similar one was made in the previous year, but after long negotiations it was accepted in a modified form, the catch of the North American Company being restricted to 7,500 seals, which they were allowed to kill as compensation for the expense of maintaining the 300 or more natives on the islands. The *modus vivendi*, which was ratified by an act of the British Parliament and the necessary legislative action of Congress, provided that American and British war vessels should jointly patrol Bering Sea and seize sealers of either American or Canadian nationality. The agreement was reached too late, for an unusual number of sealing vessels had already reached the Alaskan waters, and before their operations were stopped had destroyed more seals than in any previous season. The bill giving the British Government authority to forbid the killing of seals by British subjects was read a third time in the House of Commons on June 4, and it was not till after that, and after the United States agreed to rescind the permission allowing 60,000 seals to be killed, and forbade the commercial killing of seals altogether, limiting the number to the 7,500 seals necessary for the natives, that the English Government took steps to forbid and arrest the slaughter. Previous to the acceptance of the *modus vivendi* the British Government had taken steps to have the claim of Territorial jurisdiction over the waters of Bering Sea, beyond the three-mile limit, tested in the United States courts by having a suit brought in the Supreme Court in the case of the sealing schooner "Sayward" that had been seized by the American authorities. The court adjourned the case till October.

The British Government was impelled to accede to a *modus vivendi* by the prospect of a settlement of the Bering Sea question by arbitration. The first proposal to arbitrate had come from Lord Salisbury, and had been rejected by the Secretary of State. On April 14, 1891, Mr. Blaine, in a note to the American minister in London, made a counter-proposition, defining the questions that the United States Government was willing to submit to arbitration as follow:

1. What exclusive jurisdiction in the sea now known as the Bering Sea, and what exclusive rights in the seal fisheries therein, did Russia assert and exercise prior and up to the time of the cession of Alaska to the United States?

2. How far were these claims of jurisdiction as to the seal fisheries recognized and conceded by Great Britain?

3. Was the body of water now known as the Bering Sea included in the phrase "Pacific Ocean," as used in the treaty of 1825 between Great Britain and Russia; and what rights, if any, in the Bering Sea were held and exclusively exercised by Russia after said treaty?

4. Did not all the rights of Russia as to jurisdiction and as to the seal fisheries in Bering Sea, east of the water boundary described in the treaty between the United States and Russia of March 30, 1867, pass unimpaired to the United States under that treaty?

5. Has the United States any right, and, if so, what right, of protection or property in the fur seals frequenting the islands of the United States in Bering Sea, when such seals are found outside the ordinary three-mile limit?

6. If the determination of the foregoing questions shall leave the subject in such position that the con-

currence of Great Britain is necessary in prescribing regulations for the killing of the fur seal in any part of the waters of Bering Sea, then it shall be further determined: First, how far, if at all, outside the ordinary territorial limits it is necessary that the United States should exercise an exclusive jurisdiction, in order to protect the seal for the time living upon the islands of the United States and feeding therefrom. Second, whether a closed season (during which the killing of seals in the waters of Bering Sea outside the ordinary territorial limits shall be prohibited) is necessary to save the seal fishing industry, so valuable and important to mankind, from deterioration or destruction. And, if so, third, what months or parts of months should be included in such season, and over what waters it should extend.

The rights formerly claimed by Russia were defined in a ukase of the Czar in 1821, and were effectually exercised and acquiesced in, although the British and American governments at that time formally protested against treating Bering Sea as *mare clausum*. The convention between the American and Russian governments signed on April 5, 1824, dealt with the rights of navigation and fishery in the Pacific Ocean on the northwest coasts of America. A similar treaty was signed with England on Feb. 16, 1825, in which the region affected was limited to the seas and coasts south of the sixtieth parallel and east of the one hundred and forty-first degree of longitude, as the Russian Government was fearful lest the American treaty should be construed as annulling the principle asserted in the Czar's ukase and conveying to Americans rights and privileges in Alaska and Bering Sea. The Russian minister was instructed to advise the Government at Washington that such was not the intention or effect of the treaty, and the State Department took note of this communication.

The negotiations with regard to arbitration were continued in Washington. On June 25 Mr. Wharton submitted a final dealing with the question of indemnification to prevent the interests of the United States as owner of the seal fisheries from being ignored. Lord Salisbury objected to the proposition as prejudging the question of liability, and on July 13 Sir Julian Pauncefote submitted a form providing that not only the facts, but the liability arising from them, should be passed upon by the arbitrators. Some of the modifications were accepted by Mr. Wharton, acting for the Secretary of State, on July 23. On Aug. 18 Sir Julian Pauncefote asked for a reply regarding the question of indemnity for acts committed by the cruisers of either nation. Mr. Wharton replied that "the President thinks that it will be time to consider the question of indemnity when occasion has arisen to claim the same." The amended form proposed by Mr. Wharton on July 23 was declared on Aug. 26 to be unacceptable to the British Government, because it implied the admission of the doctrine that governments are liable for acts of their nationals, and proposed that questions of fact should be referred to the arbitrators. On the same day Sir Julian Pauncefote complained that the North American Commercial Company was violating the spirit of the *modus vivendi* by killing a greater number of seals than 7,500 on the pretext that the limitation dated from the signature of the agreement. Inquiry was made, and on Oct. 10 Mr.

Wharton wrote that the naval officers and the Treasury agent in Alaska had interpreted the limitation as beginning with the signing of the *modus*. On Sept. 7 Mr. Wharton replied to the note of Aug. 26 that the President did not assume liability on the part of the British Government, but desired to have the question of liability decided by the arbitrators, and that he could not accept the proposition to have questions of fact passed on by the arbitrators, because the facts were well known. The United States Government pressed for a rapid conclusion of the negotiations, since the *modus vivendi* would expire on May 2, 1893. As the British Government insisted on its views regarding damages, Mr. Wharton, Oct. 23, proposed that matters of fact only should be submitted to arbitration, reserving the question of liability for future negotiation. On Oct. 23 Lord Salisbury signified his acceptance of this proposition. On Nov. 23 Sir Julian Pauncefote brought forward a reservation that the necessity and nature of any regulations should be left to the arbitrators, and another stipulating that regulations should not become binding on the United States and Great Britain until they received the assent of the maritime powers. Mr. Blaine declined to consider the proposition, as it would postpone the matter indefinitely, saying that there was no objection to submit the matter to the maritime powers for their assent, but that the United States could not agree to make the adjustment with Great Britain depend on the action of third parties not directly interested in the fisheries. Sir Julian Pauncefote withdrew the first reservation, and in regard to the second suggested that either government should have the right to suspend the regulations if after the lapse of a year it was found that in spite of them injury was being done to the fisheries, the object being to prevent the fisheries from being placed at the mercy of a third power. Mr. Blaine replied that the President apprehended no danger of a third nation engaging in sealing, and suggested that if the agreement was disturbed by a third nation the two governments should act conjointly. Sir Julian Pauncefote replied on Dec. 8 that his Government did not fear that the powers would reject the regulations, but that they would refuse to allow the arrest of their vessels, and that sealing would go on in the close season under other flags. Mr. Blaine adhered to the ground he had taken, and on Dec. 11 Sir Julian Pauncefote withdrew the proposition, reserving the right of raising the question when the matter of the regulations came up before the arbitrators. Mr. Blaine objected to an appeal to the arbitrators on a subject not embraced in the seven articles of the draft treaty. On Dec. 17 the British minister renounced the intention of calling on the arbitrators to decide points not embraced in the articles, and said that he was authorized to sign the seven articles and the articles with reference to a joint commission to investigate the condition of the seals. These commissioners had already been appointed, and had visited the seal islands during the summer of 1891 and made their reports. Further correspondence resulted in an agreement that there should be seven arbitrators, of whom two should be named by the Presi-

dent of the United States, two by the Queen of Great Britain, one by the President of the French republic, one by the King of Italy, and one by the King of Sweden and Norway, all of them to be jurists of distinguished reputation in their respective countries. If the last-named persons failed to designate arbitrators within two months, the vacancy was to be filled in such manner as the parties to the treaty should agree. These stipulations constituted the first article of the draft treaty. The second article provided for the meeting of the arbitrators in Paris within twenty days after each party had presented a counter-case in answer to the other's argument; that each party should be represented by a single person as its agent; and that all questions, including the final decision, should be decided by a majority of the arbitrators. The third article provided that a printed case should be submitted by each party, and that all evidence should be delivered in duplicate to each of the arbitrators and to the agents within three months of the exchange of ratifications. The fourth article relates to the counter-case and additional evidence, to prepare which each party is allowed three months further, with sixty days more of grace on application to the arbitrators. The fifth article required the agents to deliver printed arguments to the arbitrators within a month after the delivery of the counter-cases, and permitted each party to support the same by the oral arguments of counsel. The sixth article recites the question to be submitted to arbitration in the form presented by Mr. Blaine in the first five of his original propositions. The seventh article provided that if the determination of these questions should be in such position that the concurrence of Great Britain is necessary for the establishment of regulations for the protection of seals, the arbitrators should decide what concurrent regulations would be necessary and over what waters they should extend, and on this point they might consider the report of the joint commission; and both parties agreed to co-operate in securing the adhesion of other powers to the regulations. The eighth article states that the contracting parties have been unable to agree on a reference of the question of liability for damages sustained, and declares that they agree to submit questions of fact involved in such claims, and ask for the findings of the arbitrators thereon, while reserving the question of liability for future negotiation. The ninth and tenth articles refer to the joint commission; the eleventh stipulates that the decision of the arbitrators should be rendered, if possible, within three months of the closing of the arguments; the twelfth relates to the division of the expenses of the arbitrators; the thirteenth provides for recording the proceedings; the fourteenth binds the high contracting parties to consider the decision of the arbitrators as a full and final settlement of the questions submitted; and the fifteenth and last provides for the exchange of ratifications within six months of the signature of the treaty, or earlier if possible.

The World's Columbian Exposition.—The first world's fair was held in London in 1851, and out of it grew the Anglo-French commercial treaty of 1852, and the application of free-

trade principles in many succeeding international conventions. A second was held at Paris in 1855, in which there were 20,839 exhibitors, compared with 13,037 in London, where a third exhibition took place in 1862, which attracted 28,653 exhibitors and 6,211,103 visitors. This was in turn surpassed by the Paris Exposition of 1867, in which 50,226 exhibitors took part and 8,805,969 tickets were sold. At Vienna, in 1873, there were about 50,000 exhibitors and 6,740,500 visitors. The sixth world's fair was the Centennial Exhibition at Philadelphia in 1876, which covered 60 acres and drew 30,864 exhibitors and 10,164,489 visitors. When Paris again opened an exhibition, covering about an equal extent of ground, in 1878, the number of exhibitors was 40,366, and the visitors during the one hundred and ninety-four days that it was open numbered 16,082,725. The international exhibition at Sydney in 1879, and that at Melbourne in 1880, were naturally not of the same universal character, and the Glasgow exhibition of 1888 was affected by similar limitations. The next world's fair in the true sense was held at Paris in 1889. It covered about 200 acres, and there were 55,000 exhibits, which were viewed in the course of one hundred and eighty-five days by 28,149,353 paying visitors. The city of Paris gave \$1,600,000 for the enterprise, private persons subscribed \$3,000,000 of capital, and the French Government loaned \$3,400,000 on the security of the permanent buildings, which became the property of the Government when the fair was over.

As a fitting mode of celebrating the four hundredth anniversary of the landing of Columbus on Oct. 12, 1492, it was proposed to have a universal exhibition in the United States. The idea was first taken up by citizens of New York, where subscriptions to the amount of \$5,000,000 were obtained from merchants and capitalists before application was made for the sanction and support of the Federal Government. When the matter came up in Congress the claims of Chicago were considered superior, and a bill was passed and approved on April 25, 1890, entitled "An Act to provide for celebrating the four hundredth anniversary of the discovery of America by Christopher Columbus, by holding an international exhibition of arts, industries, manufactures, and the products of the soil, mine, and sea in the city of Chicago, in the State of Illinois." The act provided for the appointment of commissioners who should organize the exposition. The World's Columbian Commission was constituted under the presidency of Thomas W. Palmer, of Michigan, with Thomas M. Waller, of Connecticut, M. H. de Young, of California, Davidson B. Penn, of Louisiana, Gorton W. Allen, of New York, and Alexander B. Andrews, of North Carolina, as vice-presidents, and John T. Dickinson, of Texas, as secretary. George R. Davis, of Illinois, was nominated director-general of the exposition. An executive committee was appointed, as well as a board of reference and control, a Chicago local board, a board of lady managers, and standing committees to deal with the following branches of the work: Judiciary, rules, and by-laws; tariffs and transportation; foreign affairs; fine arts; science, history, literature, and education; agri-

culture; live stock; horticulture and floriculture; finance; auditing; ceremonies; classification; manufactures; commerce; mines and mining; fisheries and fish culture; electricity and electrical and pneumatic appliances; forestry and lumber; machinery; world's congresses; printing; grounds and buildings. When the organization was completed and the stipulated financial support from the citizens and municipality of Chicago assured, President Harrison, on Dec. 24, 1890, issued a proclamation inviting all the nations of the earth to participate in the World's Columbian Exposition.

Since the time was too short to have the grounds and buildings completed for the summer of 1892, as was originally intended, the opening of the exposition was announced for May, 1893. When the work was fairly begun it was accelerated, as many as 10,000 workmen being employed at one time, in order to have the buildings ready to be dedicated with imposing ceremonies on Oct. 12, 1892, in commemoration of the exact date of the discovery of America. In these ceremonies the President of the United States, the Governors of the States, and the chiefs of the army and civil departments are expected to take part. During the four days devoted to the celebration a military encampment of troops of the regular army, under the command of Maj.-Gen. Nelson A. Miles, and about 10,000 of the National Guard, will be held. A grand review will take place on Oct. 11. On the 12th a salvo of 48 volleys of artillery will be fired at daybreak. The troops will salute the President on his entrance into the main building with officials of the Government and members of the diplomatic corps, representatives of the thirteen original States, and of the rest of the States in the order of their admission into the Union; he will be ceremoniously received, and after musical exercises and the reading of the director-general's report the ceremony of dedication will take place, consisting in the formal presentation of the buildings by the President of the World's Columbian Exposition to the President of the National Commission, and by the latter to the President of the United States, followed by a dedicatory oration and a salute of the batteries, and in the evening by a reception by the President. On Oct. 13 there will be an industrial and civic procession, with historical tableaux, and a ball in the evening, and on Oct. 14 a sham battle in which all the military will take part, and fireworks at night. When the ceremonies are concluded the buildings will be open for the installation of exhibits, for which the exhibitors will have nearly six months.

The site of the Columbian Exposition is Jackson Park, in the southeastern part of Chicago, on the shore of Lake Michigan, and is reached by a steamer trip of 10 miles on the lake. It includes Midway Plaisance, and has an area of 666 acres, the park fronting on the lake for a mile and a half. There will be 13 great edifices, two of which will be twice as large as any ever built for former exhibitions. By the close of 1891 the woman's building was already roofed over, and several others were nearly as far advanced. The most important and hugest structure is the hall for manufactures and liberal arts, which is 1,687 feet long and 787 feet wide, and incloses 44 acres. The ridge of the roof, of glass and

iron, which covers a space of 1,400 by 385 feet, is 150 feet above the earth. A gallery 50 feet wide runs around the outside of the building, and 30 broad stairways lead up to it. The part that is assigned to the liberal arts is ornamented with sculptured reliefs representing the seals of the States. Four archways, 40 feet broad and 80 in height, one in the center of each façade, give entrance to the main building, as well as pavilions forming arched portals at each of the four corners. The loggia surrounding the building is 25 feet wide. The entrances are ornamented with sculptures and mural paintings, and the attic story above the side arches with colossal figures of eagles.

The machinery hall, which is 492 by 845 feet, with an annex 490 by 550 feet, covers 17½ acres. On the lake front, separated by a basin from the building for manufactures and the liberal arts and having the machinery hall directly in the rear, is the agricultural building, 500 feet by 800, in one story 65 feet high, with domed pavilions 96 feet high at each corner surmounted by groups of statuary, and connected by a covered arcade and a central glass dome 100 feet in diameter and 144 feet high. The hall of mines and mining is 700 feet long by 350 broad, built in the Italian style of architecture, with arched entrances ornamented with sculptures, the subjects of which are taken from mining industries. A collection of the various kinds of marble is worked into the facings. The roof is held up by steel cantilever trusses supported by two rows of steel columns 65 feet apart, leaving a space 115 feet wide in the middle and of half that width on either side, running the whole length of the building. The electrical building is in the shape of a cross, having a nave 115 feet wide and 114 feet high and a transept of the same dimensions, and is surmounted by many towers and pinnacles designed for electrical illumination. As Jackson Park is approached by land from the city, through Midway Plaisance, the building directly facing the entrance is the horticultural hall, which is 1,000 feet long and 250 wide. The glass dome in the center is 187 feet in diameter and 113 feet high, admitting of the exhibition of the tallest palms and bamboos. At each corner of the central pavilion are smaller domes, and connecting it with the two end pavilions are greenhouses for the exhibition of plants requiring sunshine, inclosing two courts 88 by 270 feet. Parts of the building will be artificially heated for tropical plants. Alongside is the women's building, designed by Miss Hayden, of Boston, in the style of the Italian renaissance, consisting of a central pavilion and two end pavilions in two stories, connected by arcades. The structure is 400 by 200 feet. A broad staircase gives access to the central pavilion through triple arches ornamented with designs in low relief. Around each pavilion in the second story are open colonnades, and hanging gardens will be placed there. Carriages and appliances for locomotion and transportation will be exhibited in a building 960 by 250 feet, with an annex, the whole space roofed over being 16 acres. It is situated on the other side of the horticultural building from the women's hall, the three occupying the western border of the main lagoon, while the hall of mines stands next

to the transportation building, and next to that the electricity building, which is separated from the hall of manufactures and arts by a canal giving access to the basin opening into the lake through a sheltered artificial harbor. The lake shore runs northwest, and the banks of the canal and lagoon in the same direction, the space between them and the shore being covered by the main hall, and beyond that by the Government building and the grounds surrounding it, to the north of which another canal enters the lagoon from the lake. The agricultural hall fronts the basin, having its longitudinal faces at right angles to those of the main hall and the electricity, mining, and transportation buildings, while the horticultural and women's buildings face east and west. Behind the agricultural building is an annex, 300 by 550 feet, and south of that a handsome hall, 280 by 440 feet, for the assemblage of all persons interested in farming and stock-raising, and for trying and judging animals, which will be exhibited in pens near by covering 30 acres or more. The dairy building for the exhibition of the processes of making cheese and butter and tests of milk is 95 by 200 feet. Next to that, on a basin shut in from the lake by a breakwater, is the forestry building, 200 by 500 feet. The building for the exhibition of the fine arts, 500 by 320 feet, is, like the rest, a temporary structure, but will be made quite fire-proof. The central dome is 125 feet in height and 60 feet in diameter. It is situated at the north end of the park, on the bank of a small lagoon, on the other shore of which is the building for the Illinois State exhibit, and all round are other State buildings. The Illinois building is 450 feet by 160. The building devoted to the general administration (see colored illustration) is between agricultural hall and the mining and electrical buildings. Four pavilions of the same height as these, 65 feet, are surmounted by a structure of equal height and 175 feet square, forming the central rotunda and surrounded by a colonnade 20 feet wide and 40 feet high, with corner domes at the angles, and the whole is capped by an octagonal gilded dome on a base 30 feet high. This is the most ornate of all the buildings. The United States building, 350 by 420 feet, is topped by a larger octagonal dome, 150 feet high and 120 feet in diameter. One half of the building is devoted to the exhibits of the Post-office Department, which has 9,000 square feet; the Treasury Department, which occupies 10,500 square feet; the War Department, occupying 23,000 square feet; and the Department of Agriculture, occupying 23,250 square feet. In the north end the Fishery Commission occupies 20,000 square feet, the Department of the Interior 20,000 square feet, and the Smithsonian Institution the remaining space, while the exhibits of the Department of Justice and of the Department of State will fill the room on the east and west sides of the rotunda. In the exhibit of the Treasury Department, the Mint, the Supervising Architect of the Treasury, the Bureau of Statistics, the Marine Hospital, the Lighthouse Board, the Life-saving Board, and the Coast and Geodetic Survey will all be represented. The exhibit of the Coast Survey includes a relief map of the United States 400 feet broad, showing the cur-

ADMINISTRATION BUILDING, COLUMBIAN EXPOSITION.

vature of the earth and heights and depressions in correct proportions. The Navy Department will exhibit a model of one of the new battle-ships of the same dimensions as the original, with all the armament and appliances and a crew who will go through the drill and tactics of the service. The model, 348 feet long, with 60 feet of beam, is erected on piles in the harbor. The fisheries building is opposite the United States Government building, on the north side of the canal. It will have a length of 1,100 feet and a width of 200 feet, and will contain marine and fresh-water aquaria holding 140,000 gallons, of which 40,000 gallons represent the aquaria for live marine fish, evaporated sea water being supplied by the United States Fish Commission, and restored to its original density by the addition of four parts of lake water to one of the condensed salt water. In the heart of Chicago, on the lake front, a permanent building will be erected to accommodate the numerous world's congresses that will be held during the six months that the Exposition will last, and to remain as a memorial. It will contain two large halls each capable of seating 3,500 people, and 20 rooms for the meeting of sections. A musical auditorium, 160 by 200 feet, costing \$100,000, is to be erected near the horticultural hall. All wooden walls are coated with staff, a hard plaster that heightens the architectural effect, and is preservative against fire. The cost of preparing the grounds, etc., was estimated in the annual report of the World's Columbian Commission, dated Nov. 25, 1891, at \$4,693,490; the expenses of administration, operating expenses, awards, etc., at \$6,536,963; and the cost of the buildings to be erected by the World's Columbian Commission at \$7,295,000. Under the first head the items are as follow: Grading and filling, \$450,400; landscape gardening, \$323,490; viaducts and bridges, \$125,000; improving water ways, \$225,000; piers, \$70,000; railroads on the grounds, \$500,000; steam plant, \$800,000; electricity, \$1,500,000; statuary, \$100,000; lamps, etc., \$50,000; sewerage, water supply, etc., \$600,000. The cost of the principal buildings was estimated as follows: Manufactures and arts building, \$1,100,000; agricultural, livestock, dairy, and forestry buildings, \$1,000,000; machinery hall, with annex and power house, \$1,200,000; electrical building, \$375,000; hall of mines and mining, \$260,000; transportation building, \$300,000; horticultural building, \$300,000; women's building, \$120,000; art palace, \$600,000; fisheries building, \$200,000; administration building, \$450,000; Government building, \$400,000. The total outlay of the Exposition Company was estimated at \$18,525,453, and the probable receipts were stated to amount to \$23,155,035, including \$5,628,000 of stock subscriptions already obtained, and \$5,000,000 of bonds of the city of Chicago, the gate receipts being estimated at \$10,000,000, the receipts from concessions and privileges at \$1,500,000, salvage at \$1,000,000, and interest on deposits, amounting already to \$27,035, no account being taken of future interest on deposits and further subscriptions which were still being made in considerable amounts. At the time of the report about 60 per cent. of the subscribed capital had been paid in. In order to make up the \$18,500,000

or more that would be required to prepare and equip the grounds and buildings, the Illinois company found it necessary to raise about \$8,000,000 more than they had already. It was proposed to ask Congress for a loan of \$5,000,000 from the United States treasury, and afterward it was decided to apply for a grant or appropriation of that amount. This amended proposition of the Exposition Corporation was approved by the National Commission, and recommended by the President in a message to Congress.

To stimulate interest in the World's Columbian Exposition in Europe and supply information, a commissioner was appointed in London, and a commission made the round of the European capitals in the summer of 1891, while special commissioners were sent to Mexico and other American countries. The appropriations voted by foreign countries for participation in the exposition amount to about \$4,500,000. Among others, the Argentine Republic voted \$100,000; Austria, \$147,000; Bolivia, \$150,000; Brazil, \$550,000; Chili, \$100,000; Colombia, \$100,000; Costa Rica, \$100,000; Ecuador, \$125,000; France, \$400,000; Germany, \$250,000; Great Britain, \$125,000; Guatemala, \$120,000; Honduras, \$20,000; Japan, \$500,000; Mexico, \$750,000; Nicaragua, \$50,000; Norway, \$60,000; Peru, \$100,000; Salvador, \$30,000; British Guiana, \$20,000; British Honduras, \$7,000; Dutch West Indies, \$10,000; Dutch Guiana, \$6,000; Danish West Indies, \$10,000; Ceylon, \$40,000. The first appropriations made by the States and Territories were as follow: Arizona, \$30,000; California, \$300,000; Colorado, \$100,000; Delaware, \$10,000; Idaho, \$20,000; Illinois, \$800,000; Indiana, \$75,000; Iowa, \$50,000; Maine, \$40,000; Maryland, \$60,000; Massachusetts, \$75,000; Michigan, \$100,000; Minnesota, \$50,000; Missouri, \$150,000; Montana, \$50,000; Nebraska, \$50,000; New Hampshire, \$25,000; New Jersey, \$20,000; New Mexico, \$25,000; New York, \$300,000; North Carolina, \$25,000; North Dakota, \$25,000; Ohio, \$100,000; Pennsylvania, \$300,000; Rhode Island, \$25,000; Vermont, \$20,000; Washington, \$100,000; West Virginia, \$40,000; Wisconsin, \$65,000; Wyoming, \$30,000. New Jersey afterward increased its appropriation by \$50,000, Iowa added \$125,000 to the sum first voted, and Massachusetts appropriated \$75,000 more.

The British building will probably be a reproduction of Shakespeare's cottage at Stratford-on-Avon. Germany is expected to present a picture of national life in the form of a German village. Other attractions will be a Pompeian dwelling, a Japanese village, models of the caravels of Columbus and various famous ships, and luminous fountains. The Swiss Government will include in its exhibits a panorama of the Bernese Oberland. There will be a Moorish pavilion and café. A Turkish bazar for the sale of Oriental goods will be opened by a Constantinople firm of merchants. An East Indian village will occupy 200,000 square feet in Midway Plaisance. It is intended to have a bazar of all nations in which the curious products of each will be displayed for sale amid the customary surroundings. A citizen of Cairo, Egypt, has obtained a concession for a realistic repre-

duction of one of the streets of Cairo. There is to be also a special Korean exhibit. An exhibit of the products of Java and the South Sea islands will include a spectacular representation by natives. All private enterprises will be confined to Midway Plaisance. No sales of merchandise for immediate delivery will be permitted in the exposition buildings, nor anywhere on the grounds unless the privilege has been obtained from the Committee on Ways and Means. Among the concessions granted, one is for a moving sidewalk, another for a hydraulic sliding railroad running the whole length of Midway Plaisance, a third for a glass furnace to illustrate the processes of making American glassware, and others for observatory towers and a multitude of other objects. The committee have approved a plan for the erection of a tower modeled after that of Eiffel, but nearly a hundred feet higher. By means of the tracks of the Illinois Central Railroad, lake steamers, elevated railroads, cable roads, and other vehicles, it is expected that 160,000 persons an hour can be carried to and from the exposition. Although the grounds are much more extensive than those of previous world's fairs, there will be abundant facilities for transportation. All the buildings are accessible by water, and on the water-ways, which have a total length of 3 miles, will be gondolas, steam launches, and all kinds of boats. They are equally accessible by means of land vehicles, and tramways and carriages of all kinds will enable visitors to pass from one part of the grounds to another with ease and speed. Goods imported for exhibition and not entered for consumption pay no import duties, and are forwarded to the exposition from any port of entry without examination. The railroad companies have adopted in concert a rule by which foreign exhibits pay the usual freight rates from the seaports to the exposition, but will be returned to the seaboard without any charge unless the ownership has changed. The admission fee will probably be 50 cents, to be paid at the turnstile, without the intermediary of a ticket, in a coin of that denomination.

It is intended to have women and their work and occupations more largely represented than at previous world's fairs. The women's building will contain special exhibits of their handicraft and accomplishments, and there will be examples of training schools for nurses, women's hospitals, kindergartens, cooking schools, educational and literary work of women, their charitable organizations, etc. In the assembly room of the women's building eminent ladies and representatives of the professional and public work of women will give addresses. Conventions and reunions of a majority of the military and civic societies of the country, of the secret orders, and of many of the religious bodies and humanitarian associations, are arranged to be held in Chicago while the exposition is going on. The World's Congress Auxiliary is a board that has been organized for the purpose of inviting to Chicago during the exposition international conventions of the leading representatives in all departments of knowledge, progress, and public activity. Its circular announcement was forwarded to foreign governments by the Department of State, and an appropriation was made by Congress for the

promotion of its object. The following are the officers of the World's Congress Auxiliary: President, Charles C. Bonney; Vice-President, Thomas B. Bryan; Treasurer, Lyman J. Gage; Secretary, Benjamin Butterworth. There is a women's branch, of which the president is Mrs. Potter Palmer and the vice-president Mrs. Charles Henrotin. In many of the departments there are both a committee of men and one of ladies. There are, besides the executive committee, committees on arrangements, places of meeting, education, science and philosophy, literature, the public press, music, artists, commerce and finance, engineering and agriculture, government and law reform, religion, moral and social reform, temperance, labor, and public health and medicine, and these committees are subdivided into as many special committees as there are subjects suitable for a world's congress. In all there are 95 general and special committees. Each committee has issued an address setting forth the objects of the World's Congress Auxiliary and its own special object, and each chooses advisory and corresponding members among leaders in its branch in various parts of the world, and invites their co-operation in organizing a congress and arranging its programme. The active members of the committees are persons who live in Chicago, or near enough to be present at the meetings. The officers of the Board of Lady Managers of the World's Columbian Exposition are as follow: President, Mrs. Potter Palmer; Vice-President-at-Large, Mrs. Russell B. Harrison; Vice-Presidents, Mrs. Ralph Trautmann, of New York; Mrs. Edwin C. Burleigh, of Maine; Mrs. Charles Price, of North Carolina; Miss Katherine L. Minor, of Louisiana; Mrs. Beriah Wilkins, of the District of Columbia; Mrs. Susan R. Ashley, of Colorado; Mrs. Flora Beall Ginty, of Wisconsin; and Mrs. Margaret Blane Salisbury, of Utah. The Board of Reference and Control is under the presidency of Thomas W. Palmer, and the Chicago Local Board has Lyman J. Gage for president.

UNITED STATES CENSUS. The article on this subject in the "Annual Cyclopaedia" for 1890 gave a general outline of the work proposed, with the titles and functions of various divisions organized for systematic execution of the programme laid down in the act of March 1, 1889. General statistics of population were given, with tabular exhibits showing population and rank of States and Territories, together with figures giving comparative statistics concerning population of many cities. Tables summarizing the number of teachers and pupils in public schools for certain of the States and Territories and also for numerous cities were inserted. The number of convicts in penitentiaries, Indians on reservations, the finances of States and cities, colored population of the South, length and motive power of street railways in principal cities, production of pig iron and steel by States, and the coal product in Alabama, Maryland, Pennsylvania, and west of the Mississippi river were included in the article.

Population.—Bulletins have been issued from the Census Office to show the population of minor civil divisions in each of the States and Territories. The only one that needs mention here is that reporting the official count for Alaska.

The total population is reported as 31,795, including 19,130 males and 12,665 females. This number embraces persons under the following classifications: White, 3,860 male, 443 female; mixed (descendants of intermarriage between Russians and native women), 885 males and 934 females; Indian (comprising the following tribes: Eskimo, Thlinket, Athabaskan, Aleut, Tsimpsian, and Hyda), 11,987 males and 11,287 females; Mongolian (including Chinese and Japanese), 2,287 males (no females); all others, 111 males and 1 female.

Places having 1,000 Inhabitants or more.—The facts under this heading can better be stated in tabular form than in text. According to the present census there were in 1890 3,715 places of

1,000 inhabitants or more, having a total population of 26,109,074, and representing 41.69 per cent. of the total population of the United States. In 1880, 77 places had a population of 25,000 or more; in 1890, 124 places; over 8,000 in 1880, 286; 1890, 448; over 4,000 in 1880, 580; in 1890, 905. The tables on following pages give results in detail by States and Territories for each geographical division, both as regards number and population, and in the following order as to size: 25,000 and over, 8,000 and under 25,000, 4,000 and under 8,000, 2,500 and under 4,000, 1,000 and under 2,500.

Special Classes. Insane.—The total number of insane persons treated in public and private institutions (1889) was 97,535. In 1881 the num-

ber was 56,205. This shows an increase in the nine years of 41,330 or 73.53 per cent. "This percentage of increase, when compared with the percentage of increase of population in the last decade, namely, 24.86, does not indicate an increase in the proportion of insane persons to population, but rather a great increase in the amount of asylum accommodation provided and a willingness on the part of the public to make full use of all the facilities thus provided." The figures for the actual number of insane in the United States can not be determined until the work of comparing and eliminating all duplicate reports of cases has been completed and the results tabulated.

In 1889 there were 38 private institutions for the treatment of insane—25 in the North Atlantic States, 12 in the North Central States, and 1 in the South Atlantic division. Taking institutions giving complete reports of expenditures, the total annual cost per head for treatment (1889) was \$161. From 1871 to 1880 the average was \$184.

Schools for the Deaf.—In 1889 there were 6,596 pupils in the public schools for the deaf, including 3,791 males and 2,750 females. There were 43 such schools. Statistics for 11 private schools are given in the census report. They contain (1889) 135 males and 141 females. From institutions giving complete reports it is gathered that the average annual cost per pupil in the public schools, including both building and current expenditures, was \$271 in 1889 against \$252 from 1880 to 1889. The average annual number of pupils in attendance from 1880 to 1889 was 5,910.

Schools for the Blind.—The total number of pupils (1889) was 2,931. In 1880 the record shows 2,041, being an increase of 890. "The apparent increase is due to some extent to the increased facilities for the reception and education of the blind in the schools established for this purpose." The total given includes 1,578 males and 1,319 females, as against 1,064 males and 955 females in 1880. The total expenditures for 1889 are given as \$744,763, including \$169,090 for building purposes.

Pauperism and Crime. *Convicts in Penitentiaries.*—The number of convicts (1890) is returned as 45,233, the ratio of the convicts to each million of the population being 722. In 1880 there were 30,659, or, including the leased prisoners, 35,538. The ratio in 1880 was 709 in each million, the increase between 1880 and 1890 being 13. It is noted in the report that crime of a serious character is "rather on the decline than on the increase." The total number of convicts (1890) include 30,546 whites, 23,094 being native, 7,267 foreign born, and 185 nativity unknown. The reports show 1,791 female convicts.

A table of sentences exhibits the fact that (1890) 5,175 convicts were sentenced to 1 year's imprisonment; 7,684, 2 years; 5,333, 3 years; 3,080, 4 years; 6,990, 5 years; 4,180, 6 to 9 years; 5,658, 10 to 19 years; 1,657, 20 years and over; and 2,688 for life. Considering the most severe sentences, only 140 females were sentenced from 10 to 19 years; 29 for 20 years and over; and 119 for life.

Prisoners in County Jails.—According to the returns for 1890, there were 19,538 prisoners

when the returns were prepared. In 1880 the number was 12,691. This shows an increase of 6,847, or 53.95 per cent. The figures for 1890 include 13,961 white and 5,577 colored. Of these, 5,328 were negroes, 131 Chinese, and 118 Indians. The negroes consisted of 4,427 pure negroes and 901 mulattoes or negroes of mixed blood. Of the aggregate number of prisoners (which is 19,538), 1,737 were women.

Inmates of Juvenile Reformatories.—The total number of inmates (1890) is given as 14,846, compared with 11,468 in 1880. Of the total, (1890) 11,535 are boys and 3,311 are girls. The percentage of girls is somewhat larger than it was ten years ago. There are shown to be a little more than five times as many girls' in reformatories, in proportion, as there are women in penitentiaries.

Paupers in Almshouses.—The aggregate number of inmates (1890) is reported as 73,045, as against 66,203 in 1880, the increase in the decade being 6,842. The total (1890) includes 32,304 females. The number of males, white, is given as 37,887; number of males, colored, 3,354; number of females, white, 29,191; number of females, colored, 3,113. Of the aggregate, by age, 2,555 are under 5 years of age; 1,783 from 5 to 9 years; 1,289 from 10 to 14 years; and 1,623 from 15 to 19 years of age. Details concerning the aged give 345 male inmates between 90 and 94 years; 80 between 95 and 99; 40 between 100 and 104; 16 between 105 and 109; 6 between 110 and 114; 5 between 115 and 119; and 1 between 120 and 124 years of age. Aged female inmates include 51 that were between 100 and 104 years of age; 18 between 105 and 109; 9 between 110 and 114; 6 between 115 and 119; 2 between 120 and 124; and 2 between 125 and 129 years of age.

Education.—Statistics for the public schools of 1890, in States not published when the last volume of the "Annual Cyclopædia" was issued, are given below:

Social Statistics of Cities.—Interesting details are given in a census bulletin under this heading. It is stated that, taking 225 of the principal cities, 10,885 miles of streets are paved, out of a total of 35,723 miles. The average annual cost for construction and repair of streets (aggregated) is \$25,256,551. In 309 cities there are (1890) 293,847 lamps, 182,671 gas, 53,696 electric, and 57,480 oil, etc. The total police force for 253 cities is 20,738. They make 742,112 arrests annually (average). The cost of the force is given as \$17,329,160. In 268 cities the total fire-department force is 36,875, the average annual cost (aggregated) being \$11,001,323.

Religion.—The statistics of religious denominations are not complete, but figures have been given for several organizations, some having membership in each State, and others scattered here and there throughout the country. The following table will give an idea of the

membership* and value of church property in 1890:

DENOMINATIONS.	Members.	Property.
United Presbyterian Church.....	94,432	\$5,408,084

Finance. *United States.*—The debt of the United States (less sinking fund) as a unit, distinct from States and Territories (1890) is reported by the Census Office as \$915,962,112. The amount in 1880 was \$1,922,517,364. The decrease thus given is \$1,006,555,252. The bonded debt in 1890 is shown as \$711,313,110; floating debt (less cash in Treasury), \$204,649,002. The total debt, less sinking fund, *per capita* (1890) according to the foregoing figures, \$14.63. In 1880 the *per capita* was \$38.33. It is noted that the public debt for the years named "is in each case the debt less cash in the Treasury, as reported by the Treasury monthly debt statement, exclusive of the amount of bonds issued to the Pacific railroads and that of interest accrued on the public debt, but not matured."

State.—The aggregate debt of the States and Territories (less sinking fund)—these States and Territories being considered as units, distinct from counties, cities, towns, and other minor civil divisions—in 1890 is stated to have been \$223,107,883, against \$290,326,643 in 1880, the decrease being \$67,218,760. The bonded debt, aggregated (1890) is reported as \$223,128,544; floating debt, \$47,804,012; sinking fund, \$47,824,673. The *per capita* of total debt, less sinking fund (1890), is \$3.56. In 1880 the *per capita* was \$5.79.

"The indebtedness of the several States includes the amount for which bonds have been issued and are outstanding, amount due by the States to school or other funds (whether bonds have been issued or not), the arrearages of interest, and all indebtedness of a temporary nature as far as reported. The sinking fund, for which credit is given, consists only of such an amount of cash, bonds, or stocks as has been specifically set apart by law as a sinking fund for the redemption of the debt at its maturity."

County.—The aggregate debt of the counties (less sinking fund)—these counties being considered as units, distinct from cities, towns, and other minor civil divisions—in 1890 is reported as \$141,950,845, against \$124,105,027 in 1880, showing an increase of \$17,845,818. The bonded debt, aggregated (1890), is reported as \$131,124,056; floating debt, \$16,090,693; sinking fund, \$5,263,904. The *per capita* of total debt, less sinking fund (1890), is \$2.27. In 1880 the *per capita* was \$2.47.

Municipal.—The census bulletin on municipal finance was issued in November, 1890. At that time it was possible to include only 858 cities in the statement. The returns from cities gave figures for 1889-'90. Details by States appeared in the "Annual Cyclopædia" for 1890.

The aggregate debt of 858 municipalities in 1889-'90 was \$745,949,786, compared with \$695,494,741 in 1880, the increase being \$50,455,045. In these comparisons the same cities are included for each year. The bonded debt (1889-'90) was \$720,665,551; floating debt, \$25,284,235; sinking fund, \$147,181,191; total available resources including cash in treasury, \$200,575,846.

In a census bulletin showing receipts and expenditures of 100 principal cities the following aggregates under important headings are given: Receipts from taxes, \$139,283,226; liquor licenses, \$11,782,307; incomes from funds and investments, \$10,852,461; loans, \$84,352,668. Expenditures for libraries, \$818,202; schools, \$26,198,173; fire, \$11,865,402; health, \$2,280,317; lighting, \$7,747,313; police, \$17,817,435; charitable objects, \$7,166,901; streets and bridges, \$33,580,209; sewers, \$6,943,519; buildings and improvements, \$9,715,070; parks and public grounds, \$12,672,494; salaries, \$11,833,458; water works, \$19,086,751; interest on debt, \$32,250,368; loans, \$59,488,191; balance cash on hand at end of year, \$36,579,193.

Assessed Valuation.—For the three decades ending in 1880 the estimated true value of all property and the value of real estate and personal property as assessed, including the assessed valuation as returned in 1890, was as follows: 1860, assessed valuation, \$12,084,560,005, estimated true valuation, \$16,159,616,068; 1870, assessed, \$14,178,986,732, estimated true, \$30,068,518,507; 1880, assessed, \$16,902,993,543, estimated true, \$43,642,000,000; 1890, assessed, \$24,249,589,804. The increase in assessed valuation since 1880 is returned as \$7,346,596,261. The assessed valuation *per capita* (1890) is \$387.62, not including Oklahoma, as compared with \$337.01 in 1880. The increase per cent. of assessed valuation is 43.46, the increase per cent. of population being 24.86.

Agriculture. Hops.—The production of hops (1889) is reported by the Census Office as 39,171,270 pounds, grown upon 50,212 acres of land in 17 States. The 5 leading States are New York, Washington, California, Oregon, and Wisconsin. The aggregate production of these 5 States (1889) was 38,965,920 pounds, being 99.48 per cent. of the entire crop. The crop of 1890 amounted to 36,872,854 pounds, valued at \$11,105,424, or nearly three times the value of the crop of 1889. The average price of hops in 1889 was about 10 cents per pound. In 1890 it was over 30 cents.

Truck Farming.—It is stated in a census bulletin that more than \$100,000,000 are invested in this industry, the annual products reaching a value of \$76,517,155 on the farms after paying freights and commissions. This amount was realized (1890) upon 534,440 acres of land. The persons employed in truck farming included (1890) 216,765 men, 9,254 women, and 14,874 children, aided by 75,866 horses and mules, and \$8,971,206.70 worth of implements. The leading vegetables grown upon truck farms are asparagus, beans, cabbage, kale, spinach, Irish potatoes, beets, celery, cucumbers, water-melons, other melons, peas, sweet potatoes, and tomatoes.

Truck farming is distinct from market gardening, and is so considered in the figures just given, the former only being included. Truck farming

is carried on in favored localities at a distance from market, water and rail transportation being necessary. Market gardening is conducted near local markets, "the grower of vegetables using his own team for transporting his products direct to either the retailer or consumer."

Floriculture.—It is noted in a special census report that, "while floriculture has been carried on as a business in this country for upward of one hundred years, it is only within the past twenty-five years that it has assumed large proportions. Out of a total of 4,659 establishments, 2,795 were started between 1870 and 1890, and of these, 1,797 between 1880 and 1890." There are (1890) 312 commercial floriculture establishments owned and managed by women: These 4,659 establishments use 38,823,247 square feet of glass, covering more than 891 acres of ground. The value of establishments, including fixtures and heating, is placed at \$38,355,722.43; tools and implements, \$1,587,693.93. There are employed 16,847 men and 1,058 women, earning (1890) \$8,483,657. The expenses for fuel are given as \$1,160,152.66. The products (1890) were 49,056,253 rose bushes, 38,380,872 hardy plants and shrubs, and 152,835,292 of all other plants. The total value of these products is reported as \$12,036,477.76. An additional income of \$14,175,328.01 was realized from cut flowers. It is mentioned that in addition to the Society of American Florists there were (1890) 965 State and local floral societies and clubs and 358 horticultural societies.

Viticulture.—The several grape-growing districts of the United States (1889) utilized 307,575 acres in bearing vines, producing 572,139 tons of grapes, of which 267,271 tons were table grapes and 240,450 tons were used for producing wine, making 24,306,905 gallons; 41,166 tons for raisins, making 1,372,195 boxes of 20 pounds each; and 23,252 tons for dried grapes and purposes other than table fruit. The industry represents a total value in land, improvements, machinery, and appurtenances of \$155,661,150. In 1889, 200,780 persons were employed.

Irrigation.—There are reports available under this heading concerning Arizona, Idaho, Montana, Nevada, New Mexico, and Utah. For Arizona an area is shown of 65,821 acres. This represents the area on which crops were raised by irrigation in the year ending June 30, 1890. The figures for the other divisions are as follow: Idaho, 217,005 acres; Montana, 350,582 acres, not including 217,000 acres irrigated for grazing purposes; Nevada, 224,403 acres, not including 280,000 acres for grazing land; New Mexico, 91,745 acres; Utah, 263,473 acres. The number of farms irrigated in the foregoing States and Territories are, respectively, 1,075, 4,323, 3,706, 1,167, 3,085, and 9,724.

Horses, Mules, and Asses on Farms.—According to the census returns, there were "on hand," June 1, 1890, 14,976,017 horses, 2,246,936 mules, and 49,109 asses. The increase of horses from 1880 to 1890 is reported as 44.59 per cent., as against 44.95 per cent. between 1870 and 1880, and 14.34 per cent. between 1860 and 1870. The increase of mules between 1880 and 1890 was 26.66 per cent.; between 1870 and 1880 the increase was 61.08 per cent., while from 1860 to 1870 there was a decrease of 2.24 per cent.

Live Stock on Ranges.—In June, 1890, there were upon the ranges, according to the reports, 517,128 horses, 5,433 mules, 14,109 asses or burros, 6,828,182 cattle, 6,676,902 sheep, and 17,276 swine. The sale of horses (1889) amounted to \$1,418,205; cattle, \$17,913,712; sheep, \$2,669,663; swine, \$27,132. The total number of men reported upon ranges in charge of this stock is 15,390. It is noted that a large portion of Texas, Colorado, Oregon, Washington, and California, one third of Kansas, and one half of Nebraska have been converted into farms during the last decade. The statistics for farms are not included in the figures just given.

Nurseries.—The number of nurseries in the United States (1890) is given as 4,510, valued at \$41,978,835.80, and occupying 172,806 acres of land, with an invested capital of \$52,425,669.51. Employment is given to 45,657 men and 2,279 women. The number of animals used is given as 14,200. The value of implements for the propagation and cultivation of trees and plants is shown as \$990,606.04. The grand total of plants and trees (1890) is estimated as 3,386,855,778. Of this number, 518,016,612 are fruit trees; 685,603,396 grape vines and small fruits; and the balance are nut, deciduous, and evergreen trees, hardy shrubs, and roses. The largest acreage (20,232.75) is devoted to apple trees.

Seed Farms.—There were in the United States (1890) 596 farms, with a total of 169,851 acres, devoted exclusively to seed growing, of which 96,567½ acres were reported as producing seeds. Beans were cultivated on 12,905 acres; cabbage, 1,268 acres; beets, 919 acres; cucumbers, 10,219 acres; celery, 71 acres; sweet corn, 15,004 acres; field corn, 16,322 acres; squashes, 4,663 acres; peas, 7,971 acres; musk-melons, 5,149 acres; radishes, 662 acres; and tomatoes, 4,356 acres.

The total value of farms, implements, and buildings is reported as \$18,325,935.86. In 1890 13,500 men and 1,541 women were employed.

Tropic and Semi-tropic Fruits and Nuts.—In a special report under this heading the number of acres of bearing and non-bearing trees and plants (1889) was 271,428; number of bearing trees and plants, 28,101,036; value of product (1889), \$14,116,226. The estimated number of acres suitable for planting tropical fruits and nuts is given as 24,710,879. According to the number of acres utilized, the orange ranks first (184,003), pecan second (27,419), and the almond third (13,515).

Manufactures. Distilled Spirits.—The number of proof gallons of distilled spirits consumed in the arts, manufactures, and medicine (1889) is reported as follows: Alcohol, 6,745,152; cognole spirit, 1,453,048; high wines, 75,992; whisky, 2,023,900; brandy, 266,874; rum, 189,581; gin, 222,295. The aggregate of proof gallons, as stated above, is 10,976,842.

Iron and Steel.—A report on the production of the cast-iron-pipe foundries (1890) shows that there are 36 establishments with a capital of \$14,300,933, including \$68,500 reported by two establishments not in operation in 1890. The total number employed (1890) is shown as 7,788, receiving \$3,794,407 in wages. The cost of material is set down as \$9,483,389, and the value of products as \$15,168,682. The principal material

consumed was pig iron, the quantity being 591,258 net tons, costing \$7,860,408. The output of iron piping (1890) was 513,030 tons of 2,000 pounds, valued at \$12,556,315.

A report has been issued on the product of iron and steel in the New England States. In 1890 there were 35 establishments, as against 61 in 1880 and 48 in 1870. The capital invested (1890) is given as \$13,415,450; 1880, \$11,560,408; 1870, \$5,909,000. The number of workmen (1890) was 6,645; 1880, 8,654; 1870, 3,815. The value of product (1890) is stated to be \$15,105,441; 1880, \$14,558,627; 1870, \$10,824,603.

Mines and Mining.—A recent report on the mineral products of the United States divides the 55 varieties of minerals named in the tables into metallic and non-metallic. The total value of the product for 1889, with figures for 1880 to facilitate comparison, with percentages of increase, are shown in the following tables:

PRODUCTS.	1880.	1889.	Increase, 1889 over 1880.	Per ct. of in- crease.
Metallic.....	\$190,039,865	\$269,590,457	\$79,550,622	41.86
Non-metallic.....	178,279,185	807,640,175	184,861,040	77.54
Unspecified minerals....	6,000,000	10,000,000	4,000,000	66.67
Total.....	\$369,319,000	\$857,230,662	\$217,911,662	59.00

Coal.—Of the bituminous coal mined in 1880, the total quantity is given as 38,242,641 long tons, and in 1889 as 85,383,059 long tons, the increase being 123.27 per cent. The total quantity of anthracite coal mined in 1880 was 25,580,189 long tons. In 1889 it was 40,714,721 long tons, or an increase of 59.17 per cent. The table gives the amount of coal marketed from 1882 to 1889 inclusive, with value in each class for every year named:

YEARS.	BITUMINOUS.		ANTHRACITE.	
	Quantity.	Value.	Quantity.	Value.
1882.....	57,963,088	\$72,453,797	29,120,096	\$65,520,216
1883.....	65,030,171	78,086,205	31,793,027	71,534,311
1884.....	66,809,356	70,149,824	30,718,293	61,436,586
1885.....	68,569,284	80,640,564	32,265,421	72,274,544
1886.....	68,380,119	75,554,029	32,764,710	71,555,126
1887.....	75,454,404	94,280,752	35,278,442	79,365,244
1888.....	75,602,534	98,114,585	39,216,572	72,557,213
1889.....	65,723,110	72,873,794	38,603,280	63,463,572

Pig Iron.—It is noted in the bulletin that the product of pig iron increased in the last decade more than twofold, viz., from 3,375,912 long tons in 1880 to 7,603,642 in 1889. This was valued, using the price of No. 1 anthracite pig iron at Philadelphia, at \$89,315,569 in 1880 and \$120,000,000 in 1889. The limestone used for flux tributary to this industry amounted to 4,500,000 tons in 1880, worth \$3,800,000, and to 6,318,000 tons in 1889, worth \$3,159,000.

Iron Ore.—The product of iron ore in 1880 amounted to 7,120,362 long tons, valued at \$23,156,957, and in 1889 to 14,518,041 long tons, valued at \$33,351,978.

Aluminum.—Aluminum was not reported in 1880, 1881, and 1882; in 1883 the quantity reported was 83 pounds, valued at \$875, or \$10.54 per pound; the product increased in 1884 to 150 pounds, in 1885 to 283 pounds, in 1886 to 3,000 pounds, valued at \$9 per pound; in 1887 the

product was 18,000 pounds, valued at \$3.28 per pound; in 1888 the production was 19,000 pounds; and in 1889 the quantity produced rose to 47,468 pounds, valued at \$97,335, or \$2.05 per pound. The reduction in the price of this metal was continued, so that at the present time the price is lower than \$1 per pound.

Copper.—The product of copper in 1880 amounted to 60,480,000 pounds, and in 1889 to 231,246,214 pounds; increase, 282.35 per cent.

Lead.—In 1880 the quantity of lead produced was 97,825 short tons, and in 1889 182,967 short tons, an increase of 87.04 per cent. During this period the percentage of desilverized lead has increased from 71.69 to 84.01 per cent.

Zinc.—The total product in 1880 was 23,239 short tons, and in 1889 58,860 short tons. The great increase in production is fairly well distributed over the producing States.

Quicksilver.—The product has declined from 50,926 flasks of 76.5 pounds net, worth in San Francisco \$1,797,780, to 26,484 flasks, worth \$1,190,500. The supply, which practically all comes from California, is not maintained even at increased prices.

Nickel.—This product amounted to 329,968 pounds in 1880, and to 252,663 pounds in 1889. The competition from nickel contained in Canadian copper matte is serious.

Gold and Silver.—The production of gold has decreased from \$36,000,000 in value in 1880 to \$30,000,000 in 1888, and in the other years has fluctuated between these extremes. In 1889 the value of \$32,886,744 represents a slight decline from the previous year. Silver, on the other hand, has increased from \$39,200,000 comparatively steadily to \$66,396,988. In the case of both silver and gold the coining values are given, \$20.6718 for gold and \$1.2029 for silver per troy ounce.

Mineral Waters.—The number of gallons of mineral waters sold in 1880 was 2,000,000, while in 1889 there were 12,780,471 gallons sold, an increase of 539.02 per cent.

Petroleum.—Petroleum varied from 26,286,123 barrels of 42 gallons in 1880, with slight fluctuations each year, and in 1889 showed a production of 35,163,513 barrels, the total amount during the decade being 273,092,712 barrels.

Natural Gas.—Returns show the value of natural gas produced in 1889 to be \$21,097,099, the first report of the production being in 1882, when the amount was valued at \$215,000.

Minor Minerals.—With the exception of the following minor minerals, all the remaining productions named show a greater or less increase in quantity—mica, marl, flint, crude barytes, feldspar, chromic-iron ore, and asbestos.

Fish and Fisheries.—Statistics of the whale, fur-seal, and sea-otter fisheries show that the total capital invested in all branches of the industry (1889) was \$2,081,636; the pelagic whale fishery using \$1,913,275; the shore whale fishery, \$15,604; and the fur-seal and sea-otter fishery, \$152,757. The whale fishery employed 101 vessels, aggregating 22,660.39 net tons, valued, with outfits (including apparatus and repairs), at \$1,791,173. When compared with the report for 1880 this shows a decrease of 40.94 per cent. in the number of vessels, a decrease of 41.35 per cent. in the total net tonnage, and a decrease of

38.06 per cent. in the value of the vessels and outfits, including apparatus and repairs. The total value of the products landed in 1889 was \$1,834,551, of which the whale fleet reported \$1,689,927, the shore fishery \$19,641, and the fur-seal and sea-otter industry \$124,983. When compared with the report for 1880 this shows a decrease of 36.46 per cent. in the value of the products of the whale fleet. The total number of persons employed in the whale fishery was 3,017, in shore whaling 74, and in the fur-seal and sea-otter fishery 422, making a grand total of 3,513. The whale fleet was distributed over the whaling ground as follows: Bering Sea and Arctic Ocean, 42; Atlantic Ocean, 36; Okhotsk and Japan Seas, 9; South Pacific Ocean, 8; Indian Ocean, 6. By hailing ports the distribution was as follows: New Bedford, Mass., 57; San Francisco, 27; Provincetown, Mass., 9; Edgartown, Mass., 3; New London and Stonington, Conn., 2 each; and Boston, 1. Of the fur-seal and sea-otter fleet, 11 vessels hailed from San Francisco, 7 from Port Townsend, Wash., 1 from Santa Barbara, Cal., and 1 from Salem, Mass.

It is reported that the products of the fisheries of the Pacific States in 1889 amounted to \$6,387,803 in value, the capital invested being \$6,498,239. It is shown in the exhibits that the fisheries of California are more important than those of either Oregon or Washington. Of the persons engaged in the fisheries of these States 5,338, or 38.54 per cent., are to be credited to California. Of the capital invested, \$2,684,210, or 41.31 per cent., represented California interests, and of the value of products, \$4,463,369, or 69.87 per cent., accrued from the sale of fish and other marine objects taken by the citizens of that State. The fisheries of Oregon rank next in importance to those of California, giving employment to 4,682 persons, or 33.81 per cent. of the total number engaged in the three States, the capital invested amounting to \$2,296,632, or 35.34 per cent., and the products yielding \$1,033,574, or 16.18 per cent. There were engaged in the industry in Washington 3,880 persons, or 27.65 per cent. of the aggregate number of employees in the Pacific fisheries. The amount of investment was \$1,517,397, or 23.35 per cent. The value of the catch was \$890,860, or 13.95 per cent. The canning of salmon is the most important fishery industry in the Pacific States, and the capture of salmon in many places is wholly dependent on and tributary to the canning business. Of the 63 factories, 8 were located in California, 34 in Oregon, and 21 in Washington. The quantity of fresh salmon utilized in the preparation of the canned product was 41,632,223 pounds, for which the fishermen received \$1,783,227. The canned goods consisted of 622,037 cases, worth \$3,703,838.

Transportation. Railroads.—Figures representing eight groups of States have been made public, but the totals for the United States have yet to appear in tabular form.

Group 1 includes the New England States.

Group 2 includes New York, New Jersey, Pennsylvania, Delaware, Maryland, and part of West Virginia.

Group 3 includes Ohio, Indiana, southern peninsula of Michigan, and parts of Pennsylvania and New York.

Group 4 comprises Virginia, West Virginia, North Carolina, and South Carolina.

Group 5 includes Kentucky, Tennessee, Mississippi, Alabama, Georgia, and Florida.

Group 6 includes Illinois, northern peninsula of Michigan, Minnesota, Wisconsin, Iowa, North Dakota, South Dakota, and Missouri.

Group 7 includes Nebraska, Montana, and Wyoming, and parts of North Dakota, South Dakota, and Colorado.

Group 8 includes Missouri south of Missouri river, Arkansas, Kansas, Indian Territory, Colorado south of Denver, and New Mexico north of Santa Fé.

Group 9 includes Louisiana, Texas, and part of New Mexico.

Group 10 includes California, Oregon, Washington, Idaho, Nevada, Arizona, Utah, and part of New Mexico.

GROUPS.	Passengers carried.	Total earnings and income.	Expenditures.	Miles operated.
Group I.... 1880.	52,221,388	\$49,001,720	\$46,915,222	6,021
1889.	103,374,387	69,475,555	65,909,651	6,942
Group II.... 1880.	81,730,119	202,206,732	187,849,894	14,585
1889.	159,079,005	282,202,555	274,221,065	18,620
Group III.... 1880.	27,749,647	104,467,129	96,426,862	14,624

On the Great Lakes.—In a bulletin on freight traffic the tonnage has been divided into four classes, viz.: Products of agriculture, products of mines and quarries, other products, manufactures, miscellaneous merchandise, and other commodities. The products of mines and quarries give 54.22 per cent. of the total shipping industry, lumber gives 23.84 per cent., and the products of agriculture, 16.50 per cent., leaving the miscellaneous carriage small. The excess of shipments over receipts in the class of mines and quarries was 854,800 tons, and of agriculture 366,330 tons, while the excess of receipts of lumber was 1,508,859 tons, and of manufactures and miscellaneous merchandise, 377,554 tons. Including all the traffic on the Great Lakes, 669,158 tons of all classes of merchandise were received in excess of shipments.

The average distance for which freight on the Great Lakes is carried is 566 miles. From this it appears that the total ton mileage on the Great Lakes for the season of 1889 amounts to 15,518,360,000 ton miles. The aggregate ton mileage of railways for the year ending June 30, 1889, was 68,727,223,146.

Floating Equipment.—The number of vessels on the Great Lakes Dec. 31, 1889, was 2,784; the gross tonnage 924,472, and the net tonnage 780,119. The estimated carrying capacity of these 2,784 vessels was 1,254,271 tons, and the commercial valuation was \$48,809,750.

UNITED STATES, FINANCES OF THE.
The receipts and expenditures of the United States for the year ending June 30, 1891, compared with those of the year previous, may be classified and compared as follows:

RECEIPTS.		
SOURCES.	1890.	1891.
Internal revenue	\$142,606,705 81	\$145,686,249 44
Customs	229,668,584 57	219,522,205 23
Sales of public lands	6,358,272 51	4,029,585 41
Tax on circulation of national banks	1,801,826 58	1,286,042 60
Repayment of interest by Pacific railways	705,691 52	823,904 04
Sinking fund for Pacific railways	1,842,564 52	2,326,359 87
Customs fees, fines, penalties, and forfeitures ..	1,299,324 52	966,121 82
Fees, consular and lands ..	1,799,070 59	1,714,526 03
Proceeds of sales of Government property	192,128 99	259,379 03
Profit on coinage of silver dollars	9,385,416 57	6,221,888 42
Profit on other coinage ..	881,827 68	1,450,656 40
Revenues of District of Columbia	2,809,180 93	2,858,597 74
Tax on seal skins	262,500 00	269,673 83
Fees on letters patent	1,347,621 73	1,305,255 81
Miscellaneous	2,670,821 11	8,917,805 07
Total net receipts exclusive of public debt ..	408,080,982 68	392,612,447 81
Public debt, principal	245,293,650 00	878,298,567 75
Total	\$643,374,632 68	\$765,821,305 06

EXPENDITURES.		
PURPOSE.	1890.	1891.
Congress	\$6,498,052 70	\$7,108,469 80
Executive department	11,298,580 28	12,526,580 07
Judiciary	4,849,692 06	5,808,080 77
Foreign intercourse	1,648,276 59	2,028,715 26
Improving rivers and harbors	11,787,437 83	12,250,627 28
Other expenses, military establishment	82,845,400 25	86,469,437 78
Constructing new war vessels	6,581,808 03	10,603,197 15
Other expenses, naval establishment	15,174,408 21	15,504,699 81
Indians	6,708,046 67	8,527,469 01
Pensions	106,936,555 07	124,415,951 40
Construction of public buildings, including sites	4,377,949 92	4,811,822 16
District of Columbia	5,677,419 52	5,685,510 61
Premiums on bonds purchased	20,304,224 06	10,401,220 61
Interest on public debt	36,099,284 05	37,547,183 37
Miscellaneous	47,555,005 42	72,138,999 82
Total net expenditures, exclusive of public debt	318,040,710 66	365,778,905 85
Public debt, principal	312,206,367 50	365,852,470 87
Total	\$630,247,078 16	\$731,126,376 22

The surplus revenues of the Government for the year ending June 30, 1891, were \$37,239,762.57, that amount being the excess of ordinary receipts over ordinary payments, excluding payments on account of premiums on bonds purchased. To this amount was added \$54,207,975.75, deposited in the Treasury under the act of July 14, 1890, for the redemption of national-bank notes; \$9,363,715, an additional amount received during the year on same account; \$13,810 received for 4-per-cent. bonds issued for interest accrued on refunding certificates converted during the year; and \$34,132,372.16 taken from the cash balance in the Treasury, making a total of \$134,947,635.48, which was expended for loans and redemption of national-bank notes, as follows:

Redemption of bonds and notes for sinking fund, including \$3,880,086.28 premiums.....	\$47,566,197 65
Surplus old loans.....	193,695 00
National bank notes.....	29,553,298 50
Purchase of funded loan of 1891 (4½ per cents).....	80,280,150 00
Purchase of funded loan of 1907 (4 per cents).....	26,507,250 00
Premiums thereon.....	6,541,184 88
Total.....	\$184,947,035 43

The ordinary receipts show a falling off during the year of \$10,468,535.31; those from customs, about \$10,000,000; sales of lands, \$2,000,000; profit on coinage of silver dollars, \$3,000,000, while there was an increase in most of the other sources. The ordinary expenditures show an increase of \$57,636,198.14. Of this, the principal items of increase and their amounts were as follows:

Refund of direct taxes.....	\$11,521,497
Repayment to importers, excess of deposits.....	3,089,768
Debitures or drawbacks.....	1,938,630
French spoliation claims.....	1,085,240
Expenses of eleventh census.....	4,988,838
Colleges for agriculture, etc.....	1,081,000
Salaries and expenses of United States courts.....	1,398,298
Military establishment.....	4,137,226
Naval establishment.....	4,107,690
Indian service.....	1,819,422
Pensions.....	17,479,096
Interest on public debt.....	1,447,851

Debt.—The only change of any note in the bonded debt has been the redemption of the 4½-per-cent. bonds. On June 30, 1890, there was outstanding of these bonds \$109,015,750. By the terms of their issue, these bonds were redeemable at the pleasure of the United States after Sept. 1, 1891. On April 1, 1891, the bonds had been reduced, by redemption or purchases to \$53,854,250, of which about one half were deposited with the Treasurer of the United States by national banks, to secure circulation or deposits. The Secretary of the Treasury therefore, to avoid monetary disturbance, offered to the holders of these bonds their choice of presenting them for redemption with interest to Sept. 2, 1891, or for continuance at the pleasure of the Government, with interest at 2 per cent. per annum after that date. Under this proposal there has been continued to December 31, 1891, the sum of \$25,364,500. On the remainder, interest ceased Sept. 2, 1891, and the bonds have nearly all been redeemed. The 2-per-cent. continued bonds are quoted in the market at par, though payable at the option of the Government, a rate of credit unequalled by any government in the world and unprecedented in modern times.

The following table shows amounts of debt at dates mentioned, classified according to those that have and those that have not equivalent reserves in cash:

OBLIGATIONS HAVING NO SPECIFIC RESERVE.

CHARACTER OF DEBT.	OUTSTANDING.	
	June 30, 1890.	Dec. 31, 1891.
Four and one half per cents...	\$109,015,750	*\$25,364,500
Four per cents, bonds.....	602,193,500	559,574,000
Four-per-cents, certificates.....	103,860	88,470

Total.....	\$781,491,532	\$757,800,432

* Not stated.

Coinage.—There was coined in the several mints during the fiscal year ending June 30, 1891, 119,547,877 pieces, valued as follows:

Gold.....	\$24,172,902 50
Silver dollars.....	84,372,802 00
Subsidiary silver.....	2,089,318 85
Minor coins.....	1,166,866 30
Total.....	\$62,611,129 35

being the largest coinage in the history of the mint in this country.

During the year there was exchanged of fine gold bars for gold coins \$24,965,695.20, though under the act of March 3, 1891, an exchange was imposed for such an exchange of four cents for one hundred dollars in value. The exports of gold from the United States during the above year was \$86,462,880, of which \$57,504,000 were

in domestic coins. During the same period the imports of gold amounted to \$18,516,112, showing a net loss of gold of \$67,946,768, almost entirely of our gold coins, of which \$35,286,950 were consigned to Great Britain, \$14,450,005 to France, \$12,429,500 to Germany, the remainder to various countries.

During the year an important change has occurred in the coinage of the silver dollar. To Aug. 13, 1890, the purchases of silver for coinage into dollars were made under the act of Feb. 23, 1878, and they amounted to 3,108,199.47 ounces, costing \$3,049,426.46. There were coined during the year under this act 8,740,327 silver dollars. On Aug. 13, 1890, the act of July 14, 1890, went into effect, requiring the purchase monthly of 4,500,000 ounces of silver, and the coinage per month, until July 1, 1891, of 2,000,000 ounces; after that date of only such an amount as might be necessary to provide for the notes therein authorized, which notes were made a legal tender in payment of all debts, public or private, except where otherwise expressly stipulated in the contract, were to be issued in payment of the bullion purchased, one dollar for 371½ ounces of pure silver, and redeemed *in coin* by the United States Treasury.

It will be noticed that the notes are redeemable in coin, the character of which is not specified, but in another section it is specifically stated that the Secretary of the Treasury shall redeem them in either gold or silver, "it being the established policy of the United States to maintain the two metals at a parity with each other upon the present legal ratio, or such ratio as may be provided by law."

During the year ending June 1, 1891, there were purchased, under the above act, 53,770,125.61 standard ounces of silver, at a cost of \$50,577,498.44, for which notes in question were issued, and there was coined thereunder, to June 30, 1891, 27,292,475 silver dollars, which, with the amount previously stated, coined under the act of 1878, and 200,000 pieces coined from trade dollars, under act of March 3, 1891, makes the total coinage of silver dollars for the year 36,232,802 pieces, on which there was a seigniorage or ostensible profit of \$6,221,333.42, that sum representing the difference between the commercial and the face value of the coins in question.

The fluctuations in the value of silver, as compared with the gold standard, were unusually great during the year, making the lowest value of silver contained in a silver dollar \$0.75, the highest \$0.936, or an average value of \$0.814.

Under the appropriation by Congress of \$150,000 for loss of metal in the coinage of uncurrent fractional silver coins there was recoined of such pieces in face value \$4,277,917.74, on which the loss from abrasion was \$134,676.10, or about 3 per cent.

Circulation.—Of the circulation of the country there has been a decrease in total gold coin of about \$30,000,000 between June 30, 1890, and Nov. 1, 1891, and during the same period an increase of \$40,000,000 in silver dollars, according to the estimate of the director of the mint. There was, however, at the same time, an increase of certificates issued for which coin was held, leaving the net coin in circulation, includ-

ing fractional pieces, at the latter date, \$504,604,015, against \$547,594,158 on June 30, 1890.

The amount of outstanding paper money has also been subjected, meanwhile, to several important changes. The national banks have decreased their circulation more than \$15,000,000, but under the act of July 12, 1890, there has been put into circulation, for which the Government holds purchases of silver bullion presumed of like value, \$68,725,270, representing an increase of circulation to that extent. Also the fund for redemption of national-bank notes, amounting on June 30, 1890, to \$61,238,857, was covered into the Treasury by the same act, except the small portion known as the 5-per-cent. fund, established to meet current redemptions of the notes, reducing the fund to \$5,781,538 on Jan. 1, 1892, and further increasing the actual paper money in circulation, making an increase in the aggregate of the paper money in circulation between the dates named from \$908,549,612 to \$1,069,330,796, or in the total coin and paper circulation of the country from \$1,456,143,770 to \$1,573,934,811, a *per capita* increase on the census of 1890 from \$20.26 to \$25.13.

The following table shows in detail the changes in the monetary circulation of the country between the dates named:

CHARACTER OF ISSUE.	OUTSTANDING.	
	June 30, 1890.	Nov. 1, 1891.
Coin:		
Gold coin	\$629,932,449	\$596,386,272
Silver dollars	869,426,466	409,475,368
Silver fractional pieces	76,825,805	77,301,515
Total coin in country ..	\$1,076,184,220	\$1,083,163,155
From which there should be deducted the coin held in Treasury as reserve:		
For redemption of gold certificates	\$181,380,019	\$156,990,739
For redemption of silver certificates	297,210,048	323,668,401
For redemption of legal-tender notes (old issue) ..	100,000,000	100,000,000
In all	528,590,062	580,559,140
Leaving net coin circulation.	\$547,594,158	\$502,604,015
Paper:		
Legal-tender notes	\$346,681,016	\$346,681,016
Legal-tender notes of 1890	68,725,270
Fractional notes	6,911,511	6,906,692
National-bank notes	187,549,548	172,184,558
Old demand notes	56,082	55,647
Gold certificates	131,380,019	156,890,739
Silver certificates	297,210,048	323,668,401
National-bank certificates ..	12,280,000	11,095,000
Total paper circulation.	\$982,068,469	\$1,036,207,328
From which should be deducted legal-tender notes reserved for national-bank certificates	\$12,280,000	\$11,095,000
Fund for redemption of national-bank notes	61,238,857	5,781,538
In all	\$78,518,857	\$16,876,538
Leaving net paper circulation	\$908,549,612	\$1,069,330,785
Add net coin circulation ..	547,594,158	504,604,015
Total circulation	\$1,456,143,770	\$1,573,934,800
Circulation <i>per capita</i> , census of 1890	\$28 26	\$25 13

National Banks.—During the year ending Oct. 31, 1891, there were organized 193 new national banks, located in 41 States and Territories, and possessing an aggregate capital of \$20,700,000. During the same period 41 banks went into voluntary liquidation, and 25, with a capital of \$3,662,000, became insolvent, leaving a net gain of 127 banks with a capital of \$12,553,000.

The total number of banks in existence Oct. 31, 1891, was 3,694, having in capital stock \$684,755,865; bonds deposited to secure circulation, \$152,113,850; bank notes outstanding, \$171,368,948, including \$35,430,721, representing lawful money deposited to redeem circulation outstanding. The amount of circulation secured by the pledge of United States bonds has increased during the year \$11,795,101, notwithstanding a considerable decrease in the aggregate.

Of the new banks organized, 17 were located in Texas and a like number in Pennsylvania, each of these two States organizing within the year more banks than any other State. More than half of the new banks were west of the Mississippi river. Of the 25 banks which failed during the year, 13, representing a capital of \$1,137,000, were in Kansas and Nebraska.

The following statement shows the resources and liabilities, in aggregate, of the national banks for the period named:

RESOURCES.	Oct. 2, 1890.	Sept. 25, 1891.
	3,540 banks.	3,677 banks.

UNIVERSALISTS. The statistical reports of the Universalist Church, presented to the General Convention in October, showed that the number of parishes was 947; of church members, 41,177; and of members of Sunday schools, 57,110.

The General Convention met at Worcester, Mass., Oct. 20. The Hon. H. W. Parker, of New Hampshire, presided. The treasurer reported that he had received \$57,000 during the year, and held securities in trust, etc., to the value of \$247,000. The report of the Board of Trustees embodied a report of the mission in Japan, which was represented as in a prosperous condition, and as offering a favorable opportunity for the introduction of the Universalist system of faith. The proposition of the National Unitarian Conference concerning co-operation with the Universalist Church in America and Japan was received with favor, and the convention gave its assurance that any steps taken toward a closer working union with either the Unitarian or the German Liberal branches of the Christian Church in Japan, provided the distinctive features of Universalism were recognized, would meet with its hearty approval and sympathy. The convention recommended the opening of the Columbian Exposition, but without the use of machinery, on Sunday. The resolutions on temperance urged united action against the saloon, and condemned the use of tobacco, recommending that all councils of the Church require candidates for the ministry to be free from the habit. The meeting of the Woman's Centenary Association was held in connection with that of the General Convention.

URUGUAY, officially known as the Banda Oriental del Uruguay, a republic in South America. The President is elected for four years by electors chosen by the popular vote. The Congress consists of a Senate of 19 members, 1 from each department, elected for six years by an electoral college, and a House of Representatives having 1 member for every 3,000 adult male citizens who are able to read and write, elected by direct popular suffrage for three years. Congress sits every year from the middle of February till the middle of July. Dr. Hereira y Obes was elected President for the term ending March 1, 1894. His Cabinet, at the beginning of 1891, was composed as follows: Minister of the Interior, A. Capurro; Minister of War and Marine, Col. J. Villar; Minister of Justice, Worship, and Public Instruction, Dr. C. Berro; Minister of Foreign Affairs, B. Vidal; Minister of Finance, Dr. C. Pena.

Area and Population.—Uruguay has an area of 69,835 square miles, and a population of 683,943 persons, as officially estimated in 1889. The preliminary results of the census of 1891 make the population 711,656. The number of marriages during 1889 was 4,175; of births, 26,981; of deaths, 12,882; excess of births, 14,099. In 1890 there were 24,117 immigrants, while the number of departures was 19,852. Montevideo, the capital and chief port, had a population of 175,000 in 1889. The army numbers 221 officers and 3,234 men, the police troops about 3,200 men, and the National Guard 24,000 men. There is a naval force of 7 small steamers, 3 gunboats, and 1 steam loop.

Finances.—The receipts of the treasury during the fiscal year ending June 30, 1889, were \$15,690,294, of which \$9,557,835 were derived from customs, \$1,630,439 from direct taxation, \$1,180,756 from patents, and \$3,320,264 from other sources. The public debt on Jan. 1, 1890, amounted to \$81,279,752.

Commerce.—The imports in 1890 had a total value of \$32,365,000, of which \$8,772,000 came from Great Britain, \$5,099,000 from France, \$2,809,000 from Germany, \$2,643,000 from the Argentine Republic, \$2,629,000 from Italy, \$2,473,000 from Brazil, \$2,445,000 from the United States, \$2,174,000 from Spain, \$1,493,000 from Belgium, and \$1,825,000 from other countries. The total value of the exports was \$29,086,000, of which \$6,121,000 went to France, \$3,946,000 to Great Britain, \$3,279,000 to Brazil, \$3,141,000 to Belgium, \$2,551,000 to the Argentine Republic, \$2,004,000 to the United States, \$1,020,000 to Germany, and \$7,024,000 to other countries. The export of hides and leather was \$9,413,000 in value; wool, \$7,866,000; meat, \$3,881,000; extract of beef, \$1,677,000; tallow, \$1,655,000; grain, \$924,000; live animals, \$545,000; marble, \$450,000; horse hair, \$413,000. The wool clip is about 70,000,000 pounds per annum, valued at \$10,000,000. The climate is so temperate and the pasturage so rich that the flocks and herds multiply at an extraordinary rate. In 1888 the number of cattle slaughtered was 773,449, the only valuable products being hides and tallow, as the meat finds little use except for beef extract. A small proportion of the mutton and beef, though considerable in quantity, has more recently been shipped abroad in the frozen condition, and there is a large exportation of jerked beef to Brazil. Wheat, corn, olives, grapes, and tobacco are raised, mainly by Spanish, Swiss, and Italian colonists. There were 1,431 ocean vessels, of 1,812,361 tons, entered at Montevideo in 1890, including 820 steamers, of 1,397,983 tons; while the total number cleared was 1,362, of 1,779,277 tons, of which 841, of 1,376,184 tons, were steamers.

Communications.—The railroads open to traffic on April 1, 1891, had a total length of 1,127 kilometres. There were 664 kilometres in course of construction, and 2,260 kilometres more were planned. The number of pieces of mail matter sent during 1889 was 14,975,246 in the internal and 6,364,811 in the international service. The receipts of the post-office were 1,114,941 francs, and the expenses 1,062,531 francs. The telegraphs on Jan. 1, 1890, had a length of 3,764 kilometres. The number of dispatches in 1889 was 189,412.

The Financial and Political Situation.—Conflicts on political and financial questions led to the resignation of the ministry on Feb. 28, and on March 4 a cabinet of conciliation was formed, composed as follows: Minister of the Interior, Captain-General Perez; Minister of Foreign Affairs, Manuel Herrero y Espinosa; Minister of Finance, Carlos Maria Ramirez; Minister of War and Marine, Gen. Callorda; Minister of Commerce, Agriculture, and Public Works, José Maria Castellanos. An advance of \$5,000,000 was obtained from bankers to help the Government out of its financial difficulties. Early in May, Juan Capurro succeeded Señor

Castellanos as Minister of Commerce and Agriculture. The Government was compelled to let some of the railroad guarantee bonds go into default, being involved in the financial crisis that overtook the country in consequence of the collapse of gigantic speculations carried on in sympathy with those in Argentina, that were in fact instituted by the same people in both countries. The foreign debt, consisting of a unified loan of £10,624,000 paying 5 per cent., and a sterling loan of £4,120,000 paying 6 per cent., imposed an interest charge greater than the Government could meet, and the English bondholders were constrained, in August, 1891, to agree to a general reduction of the rate of interest to 3½ per cent. The bill authorizing the consolidation of the external debt on this basis was passed by both Chambers in the beginning of October. On Oct. 11 a revolution was attempted in Montevideo. The revolutionists, who belonged to the party of Blanco, attempted without success to suborn the artillery. A rising took place in the suburb of La Unión, and simultaneously men collected in the country districts. Soldiers were at hand to suppress the insurrection, and after a short fight, in which 54 persons were killed, and many wounded, quiet was restored. There were 52 arrests made. About 700 insurgents collected in the capital. The leader, Dr. Pantaleon Perez, was shot, and several of the chief conspirators were made prisoners in the beginning, as they entered the artillery barracks, having been entrapped by the commander, Col. Latorre, who pretended to enter into the conspiracy. Martial law was declared in Montevideo by act of the Congress, and troops scoured the country for members of the revolutionary or Junta party, who all fled from the capital. The supporters of the Government declared that the clergy were the instigators of the outbreak, and that a bishop had delivered a speech in favor of revolt.

UTAH, a Territory of the United States, organized Sept. 9, 1850; area, 84,970 square miles. The population, according to each decennial census, was 11,380 in 1850; 40,273 in 1860; 86,786 in 1870; 143,963 in 1880; and 207,905 in 1890. Capital, Salt Lake City.

Government.—The following were the Territorial officers during the year: Governor, Arthur L. Thomas; Secretary, Elijah Sells; Treasurer, Bolivar Roberts; Auditor, Arthur Pratt; Commissioner of Common Schools, Jacob S. Boreman; Chief Justice of the Supreme Court, Charles S. Zane; Associate Justices, Thomas J. Anderson, John W. Blackburn, and Henry P. Henderson, who resigned early in the year and was succeeded by James A. Miner.

Finances.—During the two years ending Dec. 31, 1891, the receipts of the Territory were \$1,477,140.31. Of the taxes for 1891 there is still due from the counties, as nearly as can be estimated, \$226,849.77. The disbursements during the same period amounted to \$1,500,313.80. A deficiency of \$23,173.49 is shown by these figures, the chief causes for which are, first, the payment of \$11,000 to Auditor Pratt and Treasurer Roberts, under order of the court, as salaries during the time they were kept out of office, and second, to the payment of \$11,739.38 on warrants issued by Auditor Clayton in excess of

the balance shown on his books. According to these books, the warrants outstanding on March 15, 1890, amounted to \$41,623.59, but up to Dec. 31, 1891, there had been presented and paid by the Territory warrants issued by him amounting to \$53,362.07. No method is provided by law for ascertaining how many more of such warrants are still in circulation.

The total assessed valuation of property in the Territory for 1891 was \$124,986,199.37, against \$108,612,216 for 1890. The value of real property was \$72,334,655.27; improvements thereon, \$22,387,670.43; and personal property, \$30,263,872.67. Included in the assessment were 88,261 horses, valued at \$2,734,893; 246,632 cattle, valued at \$2,923,504; and 1,495,392 sheep, valued at \$2,490,866. The valuation of Salt Lake County alone was as follows: Real property, \$39,195,819.27; improvements thereon, \$6,597,095; personal property, \$13,934,558.67; total, \$59,727,472.94. The rate of taxation for 1891 was 5 mills.

Education.—The public-school system of the Territory is in its infancy, but encouraging progress is shown. The Territory supports a university and an agricultural college. At the latter institution there were 280 pupils in December, 1891, this number being all that can be conveniently provided for. The first term of the college began in September, 1890, with 22 pupils.

Charities.—The Insane Asylum at Provo has been crippled from lack of funds. Although the last Legislature appropriated a large sum for the completion of the asylum buildings and the care of the inmates, there was no money in the treasury with which to pay the warrants. The managing board was obliged to borrow money at a high rate of interest, or close the institution. It is indebted for work done and materials furnished in the sum of \$40,000.

Prisons.—The Territorial Reform School buildings were destroyed by fire on June 24, but the insurance enabled the trustees to rebuild at once without expense to the Territory. During the year the addition to the Territorial Penitentiary authorized by Congress has been completed at a cost of \$95,000.

Agriculture.—The following figures, reported by the Territorial statistician, cover the agricultural operations of 1890: Wheat, 110,114 acres, product, 2,409,454 bushels, valued at \$1,927,563.20; oats, 32,763 acres, product, 1,132,218 bushels, valued at \$532,142.46; barley, 7,358 acres, product, 212,546 bushels, valued at \$106,273; rye, 3,759 acres, product, 45,204 bushels, valued at \$27,574.44; corn, 8,776 acres, product, 165,067 bushels, valued at \$118,848.24; potatoes, 7,845 acres, product, 935,874 bushels, valued at \$496,013.22; hay, 80,647 acres, product, 120,572 tons, valued at \$1,637,367.76; lucern, 101,729 acres, product, 306,100 tons, valued at \$2,715,107.

The Territory also produced, in 1890, 7,451,252 pounds of wool valued at \$1,229,456.88; 1,847,447 pounds butter, valued at \$323,303.23; 247,875 pounds cheese, valued at \$37,181.25; 854,387 pounds honey, valued at \$76,894.83; 31,866 gallons of wine, valued at \$28,697.40; and 61,368 gallons of cider, valued at \$21,478.80. The dried fruit product was as follows: Apples, 197,167 pounds, valued at \$11,830.02; peaches,

178,594 pounds, valued at \$19,645.23; apricots, 11,895 pounds, valued at \$1,486.88; plums, 6,731 pounds, valued at \$841.38; pears, 9,921 pounds, valued at \$992.10.

Mining.—The mineral product of the Territory for 1890, as estimated by Wells, Fargo & Co., is summarized as follows: 956,708 pounds copper, valued at \$76,536.64; 5,082,800 pounds refined lead, valued at \$203,312; 63,181,817 unrefined lead, valued at \$1,895,454.51; 8,165,586 ounces of fine silver, valued at \$8,492,209.44; 33,851 ounces fine gold, valued at \$677,020; total export value, \$11,344,532.59.

Coal.—During 1890 the four bituminous mines in Utah produced 355,851 tons, valued at \$572,519. The Scofield mines yielded \$335,756; Castle Gate, \$173,527; Coalville, \$63,236.

Industrial.—There were in operation, during 1890, 310 industrial establishments, employing 3,274 persons, whose wages amounted to \$1,597,177. The raw material consumed was valued at \$2,137,291, and the manufactured product at \$5,836,104. The total invested capital was reported at \$4,405,881.

Irrigation.—In response to an invitation issued by Gov. Thomas on June 12, a convention of delegates representing nearly every State and Territory west of Mississippi river met at Salt Lake City on Sept. 15, for the purpose of considering questions pertaining to the reclamation of arid lands. The following resolutions were adopted:

That it is the sense of this convention that the committee selected to propose and present to Congress the memorial of this convention respecting public lands should ask, as a preliminary to the cession of all the land in the Territories in accordance with the resolutions of the convention, a liberal grant to said Territories and to the States to be formed therefrom of the public lands to be devoted to public-school purposes.

That this congress is in favor of granting in trust, upon such conditions as shall serve the public interest, to the States and Territories needful of irrigation, all lands now a part of the public domain within such States and Territories, excepting mineral lands, for the purpose of developing irrigation, to render the lands now arid fertile and capable of supporting a population.

The Mormon Church Property.—When the United States Supreme Court, in 1890, affirmed the constitutionality of the Edmunds law and declared the property of the Mormon Church to be escheated to the United States, it withheld its final decree in the case and intimated its desire that Congress should direct some disposition of the property so escheated. This suggestion was not acted upon by Congress, and in May of this year the court filed its final decree, in which it declared that the personal property should be devoted to such lawful charitable uses as would most nearly correspond to its former destiny. In the absence of legislation by Congress, it intimated that a master might be appointed to report a scheme for its disposition, subject to approval of the court. The case was remanded to the Utah Supreme Court for further proceedings, the property and its accumulation to remain in the hands of the receiver until otherwise ordered, and to be liable for the costs of suit and of the receivership. In obedience to this decree, the Utah court in July appointed a master, who

in January, 1892, reported a scheme of which the following is a brief outline:

1. That the funds be constituted a permanent school fund for the perpetual endowment of the public schools of the Territory of Utah.

2. That a commissioner be appointed by the court, to have custody and control of the fund, to loan the same within the Territory, in bulk or in parcels, on real estate and personal security, or invest the same in school or other municipal bonds within the Territory, either at the discretion of said commissioner or under the direction of the court.

Political Movements.—On Sept. 25, 1890, the President of the Mormon Church, Wilford Woodruff, issued a proclamation denying that his Church still countenanced polygamy, or that plural marriages were still being solemnized under its auspices, and publicly advising his followers to obey the laws of the land respecting marriage. On Oct. 6, 1890, at a general conference of the Church, this action of the president was approved, and the manifesto accepted by the people in the following language:

I move that, recognizing Wilford Woodruff as the President of the Church of Jesus Christ of Latter Day Saints, and the only man on the earth at the present time who holds the keys of the sealing ordinances, we consider him fully authorized by virtue of his position to issue the manifesto which has been read in our hearing, and which is dated Sept. 24, 1890, and that, as a Church in general conference assembled, we accept his declaration concerning plural marriage as authoritative and binding.

The radical change in Mormon doctrine involved in this unexpected action was followed by a corresponding change in the political conditions of the Territory. Since their settlement of the Territory in 1847, the Mormons have had their own political organization and have acted as a unit in political matters, while the non-Mormons, though identifying themselves with national parties, have also acted together in all local matters. The Peoples' party has been a synonym for Mormonism, and the Liberal party for anti-Mormonism. An ostensible change from these conditions began early in February of this year, Weber County taking the lead. At Ogden City, in this county, on Feb. 16, a mass meeting of Republicans was held, and on Feb. 21 a mass meeting of Democrats, at each of which meetings a considerable number of Mormons were in attendance and took part in the formation of permanent party organizations. In May a similar movement took place in Salt Lake City. On the 24th of that month the Salt Lake "Herald," heretofore the organ of the Mormon party, announced that it would hereafter represent the Democratic party. Previous to this time the Salt Lake "Evening Times" had given its support to the movement in favor of the Republican party. On June 10 the Territorial central committee of the Peoples' party met at Salt Lake City and voted that the party organization be dissolved, and that its members be free to unite with any of the great national parties. This action was regarded by the leaders of the Liberal party with considerable suspicion. Having no faith in Mormon sincerity, they believed that the movement was part of a scheme to create an impression that the Mormon Church, as an organization, was no longer united in poli-

tics, and that the admission of Utah as a State could now safely be accomplished. At a convention of the Liberal party of Salt Lake County, in July, it was resolved

That we stamp the attempt to divide Gentiles upon party lines as but another attempt of the Mormon leaders to accomplish by stealth and fraud, and with the help of Gentile allies, what they have so often failed to attain unaided, and we deplore the blindness which has led a few former friends astray.

Notwithstanding this feeling, a considerable number of former Liberals united with the few Mormons who declared themselves Republicans in forming a separate Republican organization, which put candidates in the field for the General Assembly and for local offices. The great majority of Mormons, however, became Democrats, and the Democratic organization practically passed into their control. A Territorial convention of this new democracy was held at Salt Lake City on July 21, at which a party platform was adopted, containing, among others, the following resolutions:

We are unalterably opposed to force and fraud in the conduct of elections, or to any interference with them by extraneous power or means.

We favor the full restoration of silver to the position it occupied in our national currency before its demonetization by the Republican party.

The Democratic party being naturally the friend of labor, we ask the working-men of Utah to carefully consider which of the two great national parties is best calculated to promote their welfare, and pledge to them on our part all legitimate and proper assistance to further their well-being. We are opposed to Chinese or imported contract labor, and opposed to the Republican plan in vogue in Pennsylvania of discharging workmen for striking against pauper wages.

We are in favor of the eight-hour-per-day law on all public works, and not less than the minimum rate of wages shall be paid to the various trades.

Be it resolved, That we accept the declarations and action of the Mormon people abandoning the practice of polygamy, and the People's party in disbanding the same, as done in good faith and all sincerity; and we favor the restoration of the franchise to all disfranchised citizens who will obey the laws of the United States.

At the election, Aug. 3, for members of the General Assembly and local officers, there were three parties in the field—the Democratic, the Republican, and the Liberal. The result of the election, so far as relates to the General Assembly, was as follows: Council, Democrats 8, Liberals 4; House, Democrats 16, Liberals 8. The Republicans elected no members, but they did not abandon hope. The party leaders proceeded to call a Territorial convention to meet on Sept. 2, and there a formal declaration of principles was adopted, chief among which were the following:

We deny that the Republican party in Utah is organized to unduly hasten statehood. The question of statehood for Utah is not involved in the present political issues, or in the division of the people of the Territory on national party lines.

We urge the enactment of laws which will establish uniformity and equity in the application of the general laws of the United States Government in respect to the location and development of mining property, so that prospectors may be more greatly encouraged to continue their explorations in our great mining districts.

THE CASTLE GATE, UTAH.

We demand the enactment of a law making it a misdemeanor for employers to practice what is known as blacklisting, or to interfere with the freedom of their employes in the exercise of the franchise by any sort of coercion.

We hold that eight hours should be made by law a day's work on all public works.

We are in favor of equitable railroad legislation under which railroad companies shall be encouraged to build the lines that are needed for the further development of Utah's great resources, and which shall at the same time fully protect the interests of individuals and communities in their relations to the common carriers.

We demand such legislation as will satisfactorily equalize the assessment and taxation of property.

We favor the enactment of a personal registration law which shall compel voters to register in person or by satisfactory vouchers, giving their exact residence; and we urge the adoption of a ballot law modeled after the Australian system, so that the disgrace of fraud at the polls, heretofore too familiar in some places in this Territory, may not hereafter attach to the fair name of Utah.

V

VENEZUELA, a federal republic in South America, composed of 8 States, a Federal District, 3 Territories, and 2 colonies. Under the Constitution of April 27, 1881, as revised on April 16, 1891, the Senate has 27 members, 3 from each State and 3 from the Federal District, who must be natives of the republic and at least thirty years old. They are elected for four years. The Chamber of Deputies is composed of 57 members, 1 for every 35,000 of population, who are elected for the same term by the direct suffrage of the people in the several States. The President and the members of the Federal Council serve two years. Dr. Raimundo Anduezo Palacio was elected President for the term ending Feb. 20, 1893. The Council, the members of which are chosen by Congress, elects the President, and neither he nor they can serve for two consecutive terms. The Council is composed of 8 Senators, representing the 8 States, and 9 Deputies, 1 from each State and 1 from the Federal District.

Area and Population.—The area of Venezuela is 632,695 square miles. The population, according to the census of 1891, is for the different political divisions as follows:

DIVISIONS.	Males.	Females.	Total.
Federal District.....	40,650	43,488	89,138
Bermudez.....	149,022	151,575	300,597

Total.....	1,187,189	1,186,388	2,373,577

The number of marriages in 1889 was 6,705; of births, 76,187; deaths, 55,218; excess of births,

20,969; immigration in 1890, 1,555. The population of Caracas in 1891 was 72,429.

Finances.—The receipts of the Government are estimated in the budget for 1890-'91 at 35,976,000 bolivars, of which 25,000,000 bolivars are derived from import duties, 6,060,000 bolivars from internal taxes, and 4,916,000 bolivars from public works. The expenditures, which are made to balance the receipts, are distributed as follow: Interior Department, 7,340,406 bolivars; Foreign Affairs, 2,004,969 bolivars; Department of Fomento, embracing colonization, the postal and telegraph service, and public printing, 2,685,437 bolivars; public instruction, 3,758,158 bolivars; public works, 5,790,767 bolivars; finance, 4,953,226 bolivars; public debt, 5,445,120 bolivars; war and marine, 3,997,917 bolivars. The public debt on Jan. 1, 1891, consisted of the national consolidated or internal debt of 5-per cent. bonds to the amount of 38,130,077 bolivars, a foreign debt of 67,388,462 bolivars paying 4 per cent., and 5,420,148 bolivars due under diplomatic conventions with Spain, France, and Germany and paying 3 per cent., making the total sum of 110,938,687 bolivars.

Army and Navy.—The permanent army in 1891 consisted of 11 battalions of 4 companies each, with 120 men to the company; 2 detached infantry companies; and 2 companies of artillery, with 15 guns. The whole force numbered 5,760 men. The intestine wars of Venezuela have been fought by the militia, in which all able-bodied citizens are enrolled between the ages of fifteen and forty-five. Their number in 1889 was about 250,000. In former wars 60,000 have sometimes been under arms at the same time. The naval force consists of 3 small steamers and 3 sailing vessels, with a personnel of 9 officers and 150 men.

Commerce.—Venezuela is one of the richest in natural resources of the South American republics. The chief products are coffee and cacao. The export of hides is also important. There are about 11,000,000 head of cattle in the country. Gold and copper are mined. The

gold mines of Yuruari, in Guiana, although their working has just begun, produce \$11,000,000 annually. The total value of the imports in 1889-'90 was 83,614,411 bolivars (1 bolivar = 15-4 cents); that of exports 100,917,338 bolivars. The principal exports were as follow: Coffee, 71,168,000 bolivars; cacao, 9,329,000 bolivars; gold, 9,072,000 bolivars; hides, 4,728,000 bolivars; copper, 1,972,000 bolivars; animals, 1,290,000 bolivars. The trade with the United States has largely increased and now exceeds that with European countries. In 1880 the imports from the United States amounted to \$2,270,000 in American money and the exports to the United States to \$6,040,000. In 1889 the imports of American merchandise reached \$5,000,000 and the exports to the United States exceeded \$10,000,000. The growth of this trade is due to the establishment of direct steamship communication with the United States. There were 1,155 steamers and 6,394 sail vessels entered and cleared in 1887-'88. The Venezuelan merchant fleet comprised 26 steamers and 2,497 sail vessels.

Communications.—The railroads in operation in 1891 had a length of 430 kilometres. Among the new lines that have been begun by British, American, and German companies the principal ones are the railroad to connect Caracas with the State of Carabobo and one of equal length which will run from Caracas to the city of San Carlos. The number of letters and postal cards posted in 1889-'90 was 1,572,292; the number received, 1,514,909; printed inclosures posted, 1,365,576; received, 1,604,255; expenses, 961,815 bolivars. The telegraph lines belonging to the Government had a length of 5,645 kilometres in 1890. The number of messages in 1890 was 419,724; receipts, 326,904 bolivars; expenses, 949,826 bolivars.

Boundary Questions.—By the award of the Queen-Regent of Spain the boundary question existing between Venezuela and Colombia since 1833 was settled by giving to Colombia over 2,500 square leagues of territory. The boundary dispute with England was aggravated in March, 1891, by the wounding of an Englishman named Campbell, who attempted to work a claim in the disputed territory without applying for a grant from the Venezuelan authorities and who was shot in resisting arrest, and died a few days afterward of the wound. The district where the shooting occurred was at once occupied by a British military force and the Venezuelans driven out. The British forcibly took possession of the northwest district of Guiana after the discovery that it contained some of the richest gold fields in the world, although it was actually and effectively occupied by Venezuelans previously, and was claimed by them by virtue of historical documents dating from the time of the Spanish conquest. The British title was based on the survey made about 1842 by Sir Robert Schomburg, who fixed on the Amacura river as a scientific frontier. The Venezuelans claim that their territory extends to the Essequibo river, taking in the northern part of Guiana and the rich mineral districts in the west. They dislike especially to see the mouth of the Orinoco river, their principal water way, commanded by British posts. In 1890 British military posts have been advanced as far as the Ama-

cura river. The Venezuelan Government on Feb. 17, 1890, represented to the Government at Washington that Great Britain had forcibly taken possession of a part of Venezuelan Guiana, and asked for its intervention. Secretary Blaine instructed Lincoln in London to use his good offices to bring about a resumption of diplomatic intercourse between Great Britain and Venezuela as a preliminary step toward the settlement of the dispute by arbitration. On June 25 Mr. Lincoln presented Señor Polido, the Venezuelan envoy to Lord Salisbury.

Rejection of Reciprocity.—The Venezuelan Congress in July, 1891, refused to conclude a reciprocity treaty with the United States on the terms proposed. The ground given in the report of the special committee which was adopted by Congress was that Venezuela is a purely agricultural country, exporting a limited number of natural products. To remove the import duties imposed on these in the United States would not greatly benefit Venezuela, which finds customers in many countries, while to admit American machinery and manufactured goods free of duty would be to sacrifice 25 per cent. of the customs revenue and unduly favor the manufacturers of the United States at the expense of Europeans, who are good customers of Venezuela, and who have generally given more favorable terms to merchants than have the Americans.

VERMONT, a New England State, admitted to the Union March 4, 1791; area, 9,565 square miles; population in 1890, 332,422. Capital, Montpelier.

Government.—The following were the State officers during the year: Governor, Carroll S. Page; Lieutenant-Governor, Henry A. Fletcher; Secretary of State, Chauncey W. Brownell, Jr.; Treasurer, Henry F. Field; Auditor of Accounts, E. H. Powell; Adjutant-General, Theodore S. Peck; Superintendent of Education, E. F. Palmer; Chief Judge, Jonathan Ross; Assistant Justices, John W. Rowell, Russell S. Taft, James M. Tyler, Loveland Munson, Henry R. Start, and L. H. Thompson; Clerk, M. E. Smilie. All these officials are Republicans. The Senate has 29 Republicans and 1 Democrat; the House, 172 Republicans, 62 Democrats, and 5 Independents.

Finances.—The Treasurer's statement for the year ending June 30 shows the following resources: Cash on hand, \$62,635.03; corporation tax for 1891 (estimated), \$250,000; State tax, 18 cents, one half payable Nov. 10, 1891, one half June 10, 1892 (estimated), \$320,000; due from towns, balance State school tax, \$1,553.11; due from towns, United States deposit money recalled for redistribution, \$482.80; total, \$634,670.94. The liabilities were as follow: Due towns, United States deposit money, \$21,345.49; due towns, 5-per-cent. State school tax, \$89,029.77; due Soldiers' Home, received from United States Government, \$1,575; due to soldiers, unpaid balances, \$8,153.51; temporary loans, \$154,000; total, \$274,103.77; leaving available for the current fiscal year \$360,567.17. The State has also in trust \$135,500 the Agricultural College fund, represented by registered bonds due in 1910. There is also the Huntington fund, amounting to about \$211,131, a liability of the same nature as the Agricultural College fund. The money has been used to pay current

expenses, and the interest is applied to the use of the schools for which the fund was given. To the resources should be added the direct-tax money paid later in the year by the United States Government, which amounted to \$179,407.

The following statement was published in November:

The report of the inspector of finance shows that the savings institutions and trust companies of this State hold deposits to the amount of \$21,620,803, an increase during the last year of \$2,289,738. Of the aggregate sum, \$3,317,560 is held by non-residents. The number of resident depositors is 64,393; non-resident, 8,309; aggregate, 72,702, an increase during the year of 6,943. Dividends to depositors amount to \$648,392, an increase of \$51,764. The dividends range from 4 to 4½ per cent. The amount loaned on mortgages of real estate in Vermont is \$4,668,499; on mortgages of real estate elsewhere, \$8,066,590. The table of Western mortgage investment shows that these institutions had in this class of securities, in 1879, \$1,278,399, and that the amount has increased year by year till in 1891 the aggregate sum has reached \$8,066,590.

Legislative Session.—An extra session of the Legislature was called by the Governor, to meet on Aug. 25, to enact the special laws required by act of Congress refunding the direct tax levied in 1861, and by another act providing for the erection of a Federal building at St. Albans. The Governor said also that there appeared to be a strong public sentiment calling for further legislation on the subject of the Columbian Exposition at Chicago, for which only \$5,000 had been appropriated. The session was convened on Aug. 25, and adjourned on Aug. 27. A joint resolution was passed accepting the direct-tax money and authorizing the Governor to receive it. A joint resolution was passed turning the money into the treasury. A bill making the appropriation for the World's Fair \$15,000 was passed by a vote of 150 to 49, after a strenuous effort to amend by making the sum \$10,000. It is designed to erect a building of granite, marble, and slate, to cost from \$6,000 to \$8,000. Land was ceded to the United States for sites for buildings at St. Albans. A bill was passed providing that express companies shall not charge higher rates than those of Oct. 1, 1890—that is, before the passage of the corporation tax law of the last session. The companies added 4 per cent. to their rates after the passage of that law. Among other measures passed were the following:

Incorporating the Black River Railroad Company.
Incorporating the North Craftsbury Water Company and the Pittsford Aqueduct Company.

Extending the time for completing the Rutland and Woodstock Railroad.

The Direct-tax Money.—The share of Vermont in the direct-tax money amounted to \$179,407. The question arose whether the General Government ought not to offset this by a claim for arms furnished to the State after the St. Alban's raid in 1864. The State at that time organized and officered several regiments of militia, including a regiment of cavalry, for the defense of the northern border. Some of the regiments were in active service, and all maintained their organization and were ready for duty. It seemed unfair to charge the State for arms furnished to the militia while they were

defending the border and saving the Government from withdrawing troops from the front; and the claim was not pressed. After the State Legislature passed the measure accepting the money the Governor went to Washington to receive it, and it was paid to the State treasury.

United States Senator.—On April 6 Senator George F. Edmunds sent in his resignation, to take effect on Nov. 1. He had held the office continuously for twenty-five years, having been first appointed by Gov. Paul Dillingham to the senatorship made vacant by the death of Solomon Foot, during the presidency of Andrew Johnson. It was at first supposed that a successor to Senator Edmunds could be elected at the special session of the Legislature to be called in August; but since no actual vacancy was to occur until Nov. 1, it appeared that an election would not be legal. Gov. Page therefore wrote, on Aug. 24, to Hon. Redfield Proctor, Secretary of War, that he proposed to tender him the appointment, and accordingly Mr. Proctor became Mr. Edmund's successor.

The Australian Ballot Law.—The Secretary of State recently sought the opinion of ex-Judge Powers on certain mooted points in the ballot law of 1890. Respecting the claim that the act makes no provision for a second ballot for town representative, in the event of no election on the first, Mr. Powell says:

By section 1 of the act of 1890, all existing laws regulating the conduct of elections, except as modified by the act of 1890, are left in force. There is nothing in the act of 1890 that requires the ballots for town representatives to contain anything more than the names of the candidates for that office. The old law provides that ballots for town representatives shall go into a box by themselves. That box is to be turned and the votes counted at three o'clock in the afternoon, and if no choice has been made, a new ballot is ordered, and this is repeated until an election is made. The act of 1890 does not change this procedure in the least, as I read it. Hence, under the new law, an official ballot containing the names of candidates who have been nominated for town representative, as specified in the act, is to be prepared by the town clerk and used at the election, and if no choice is made on the first ballot, counted at three o'clock, a second ballot is ordered, a new distribution of official ballots is made to the voters, and the box is kept open as required by the old law. Section 20 directs that 800 ballots for every 50 votes cast at the next preceding election, shall be provided for use in choosing a representative; and if these are all used before a choice is made, the presiding officer is to supply more.

Maple Sugar.—The year 1892 will be the first year under the law giving bounty on sugar that reaches a specified standard of excellence. Out of the 4,000 sugar-makers in the country who have complied with the law, filled out blanks, and taken the preliminary steps to secure the bounty, 2,600 are in Vermont. Sugar coming up to the test of 90° by the polariscope will be entitled to a bounty of 2 cents on a pound; that less than 90° and not less than 80° to a bounty of 1½ cent a pound. There will be none on sugar or sirup testing less than 80°. The penalty imposed upon any one found guilty of applying for or receiving the bounty when he is not entitled to it, is a fine not exceeding \$4,000, or imprisonment not exceeding five years, or both.

Railroads.—The Deerfield Valley Railroad has been opened from Wilmington, Windham

County, to the eastern end of Hoosac Tunnel. It is a narrow-gauge road, but the bed is graded for the standard gauge when the traffic and extension may require a heavier equipment.

The route for the proposed Black River Railroad has been surveyed. Starting from Cavendish, 31 miles south of Rutland and 22 from Bellows Falls, it follows the western bank of the Black river to Upper Falls, thence to Perkinsville, North Springfield, and Springfield, then down the Black river to Weathersfield Bow, where it is proposed to build a double-decked bridge, and cross the river to Claremont Junction, an entire distance of 29 miles. It is expected that work will begin in the spring.

A project has been under consideration the past year to connect Montpelier with Rutland by means of a "saddle-car railway" through Mad River valley. Briefly described, this railway has a single rail of sufficient strength of build and metal to sustain the heaviest loaded train. The road-bed is made of trusses placed 8 feet apart. In a level country the rail is 4 feet from the ground. In shape its upper part is similar to the standard rail. From each side of the car-trucks extend arms supporting at the end wheels which play upon a rail attached to each side of the trestle-work. Thus the "equilibrium" of the car is maintained. Attached to the truck are also rollers fitting into the lateral grooves of the rail. Derailment is thus rendered impossible. The locomotive proposed for this railway is novel, like everything else about it. The traction that is secured on standard roads by dead weight is obtained by lateral wheels bearing against the sides of the rail. Atmospheric pressure, crowding these wheels against the rail with a pressure of ten tons on each side, is the agency for providing the traction.

The company offers to build the railroad for a bonus of \$3,000 a mile. It will build six miles out of Rutland and put it in successful operation before the payment of any part of the bonus pledged by that town; when the road is brought to the town line of the next town, that town shall pay half of its part of the bonus, and the other half on completion of the road through the town; and so on. All the towns of Mad River valley manifested an active interest in the scheme, and in the meetings assurance of the necessary aid was given.

Farmers' League.—The State Farmers' League held a large meeting at Montpelier on June 5. The resolutions adopted included the following:

That we favor an equal and just system of taxation, based upon all real and personal property alike, and we demand of Congress a law to provide a graded income tax.

That we favor a sound and sufficient currency.

That we demand a free vote and fair count for every voter, and the adoption of the Australian system of voting for the whole State.

That we favor a universal compulsory common-school education, after a reasonable period, as a condition of suffrage.

That we demand a rigid limitation of all monopolies, especially such as speculate on farm and food products.

That we demand just and equitable freight and passenger rates on railroads.

That we favor the prohibition of the adulteration of

food and the traffic of intoxicating liquors as a beverage.

That we favor a rigid restriction of alien ownership of lands and immigration of criminals and paupers.

Temperance.—The charges of judicial laxity in cases coming under the prohibitory law have stirred the public mind during the year, and a large number of cases have been brought into the courts, particularly in Washington County. It has been almost impossible to get beyond conviction for the first offense in the county courts, even of men who have been for years engaged in the traffic. The method of evading the law is described in a message of Gov. Dillingham: "While, under the law as it now stands, the person convicted can not again open the place adjudged a nuisance without giving the bond prescribed by the statute, *any other person* may step in and do so. The result is that the *ostensible* proprietorship of the saloon changes as often as judgments are entered broad enough in their terms to affect the business, but the saloon itself goes on as if nothing had happened."

The movement in Washington County secured some convictions, with fines imposed, but many sentences were deferred, and some cases went to the Supreme Court on exceptions. In 1888 the Legislature enacted new penalties for violations of the prohibitory law. A new count began at this new point of departure. This fact explains why so many offenses are classified as first offenses, although the offenders may have been for years in the business. In the act of 1888 the Legislature did not deem it necessary to repeat in the amendatory act the words "and costs of prosecution" which follow the specification of penalties to be imposed. Shelter is taken behind this omission, and persons convicted of violations of the liquor laws have been relieved of the costs of prosecution, which amount to no inconsiderable sum.

Farm Lands.—With a view to advertising the resources of the State and bringing in capital to revive its industries, the Board of Agriculture sent a circular to the first selectman of every town, asking for the name and addresses of owners of any farms with fair buildings thereon which were unoccupied; also information regarding any reliable and extensive water-powers; any marble, granite, slate, or other valuable mineral deposits as yet undeveloped; any mill, tannery, or other manufacturing plants capable of further development; whether any farms previously untenanted had become occupied during the preceding year, and, if so, whether by loan or purchase, together with lists of occupied farms for sale. They then issued a pamphlet containing the information thus gained and setting forth the advantages of the State. This brought in applications amounting in September to 120 to one member of the board alone. They were distributed as follow: From Massachusetts, 32; New York, 21; New Jersey, 9; Pennsylvania, 8; Connecticut, 9; Kansas, 6; New Hampshire, 5; Rhode Island, 5; Illinois, 4; Ohio, 4; Minnesota, 4; Michigan, 3; Nebraska, 3; Canada, 3; Indiana, 2; California, 2; and North Dakota, South Dakota, Florida, Maine, Colorado, Georgia, Maryland, Montana, South Carolina, 1 each.

The Bennington Celebration.—On Aug. 19 Vermont celebrated the centennial of her ad-

mission to the Union, and at the same time dedicated a monument to commemorate the victory at Bennington, Aug. 16, 1777, under Gen. John Stark. The shaft stands on State Arms Hill, the center of the old town of Bennington, near the site of the old military store-house, which was the objective point of the expedition sent by Gen. Burgoyne under Lieut.-Col. Baum to seize military stores and provisions gathered by the Americans. The battle-field is about four miles west, and the main street of old Bennington extends eastward from the foot of the monument. Not far away, on this street, was the old Catamount Tavern, deriving its name from its sign, a stuffed catamount; it was destroyed by fire in 1871. Here the Council of Safety held its meetings in pre-Revolutionary days, during the troubles with New York.

The exercises attending the celebration began on Friday, the 14th, when the National Guard of the State went into camp in the meadow south of the Soldiers' Home, at Bennington. The exercises on Wednesday, the 19th, were attended by 20,000 to 30,000 people. The procession marched from the parade-ground, three miles distant. The monument was formally presented by ex-Gov. Benjamin F. Prescott, of New Hampshire, President of the Bennington Battle Monument Association, and accepted by Gov. Page in the name of the State of Vermont. The addresses of the day were made by Hon. Edward J. Phelps and President Harrison. At four o'clock a banquet was held at the camp grounds for 2,400 persons. A gold medal bearing a representation of the monument was given to President Harrison as a souvenir. On Wednesday evening the West Point cadets in attendance gave a dress parade, and a display of fire-works recalled in many of the pieces incidents of the historic fight. Thursday was devoted to an exhibition drill and a sham fight.

The centennial celebrations of the Revolution included one at Bennington, Aug. 16, 1877, and at that time the old scheme for a monument was revived, and an association was formed which carried the plan to a successful issue. The corner-stone of the monument was laid in 1887. The shaft is of gray-blue dolomite, rock-finish, which from its peculiar chromatic qualities gives out varying tints under varying conditions. The architectural feature that gives the monument distinction is the employment of the vertical curve in its construction, giving grace to its outline. This curve is continuous from base to apex. At the height of 200 feet a band of hammered stone marks the locality of the observation hall—a room 22 feet square and 16 feet high. Above this is a second band of hammered stone, and from this point to the apex the vertical curve becomes pronounced. An iron stairway leads to the observation chamber. The monument is 37 feet square at the base; its height to apex of cap-stone is 301 feet 10½ inches. A gilt star surmounts the whole, at an elevation from the ground of 307 feet 9½ inches.

VIRGINIA, a Southern State, one of the original thirteen, ratified the Constitution June 25, 1788; area, 42,450 square miles. The population, according to each decennial census, was 747,610 in 1790; 880,200 in 1800; 974,000 in 1810; 1,065,116 in 1820; 1,211,405 in 1830; 1,-

230,797 in 1840; 1,421,661 in 1850; 1,566,218 in 1860; 1,235,163 in 1870; 1,512,565 in 1880; and 1,655,980 in 1890. Capital, Richmond.

Government.—The following were the State officers during the year: Governor, Philip W. McKinney, Democrat; Lieutenant-Governor, J. Hoge Tyler; Secretary of State, H. W. Flournoy; First Auditor, Morton Mayo; Second Auditor, Frank G. Ruffin; Treasurer, A. W. Harmon; Attorney-General, R. Taylor Scott; Superintendent of Public Instruction, John E. Massey; Commissioner of Agriculture, Thomas Whitehead; Railroad Commissioner, James C. Hill; President of the Supreme Court, Lunsford L. Lewis; Judges, B. W. Lacey, Robert A. Richardson, Drury A. Hinton, and T. T. Fauntleroy.

Population by Races.—The following table shows the white and colored population of the State by counties, as reported by the Federal censuses of 1880 and 1890:

COUNTIES.	WHITE.		COLORED.	
	1890.	1880.	1890.	1880.

There were also in the State in 1890 50 Chinese, 13 Japanese, and 370 Indians.

Education.—The following public-school statistics cover the year ending July 31, 1891: Schools opened: white, 5,506; colored, 2,183; total, 7,689. Pupils enrolled: white, 219,141; colored, 123,579; total, 342,720. Daily attendance: white, 126,848; colored, 66,688; total, 193,536. Percentage of school population enrolled: white, 58; colored, 44.8; total, 52.5. Percentage of school population in daily attendance: white, 33.6; colored, 24.2; total, 29.6. Percentage of attendance: white, 73.6; colored, 73; total, 73.4. Teachers: white males, 2,097; white females, 3,613; total, 5,710. Colored males, 928; colored females, 1,080; total, 2,008. Grand total, 7,718. Average monthly salaries: male teachers, \$31.40; female teachers, \$26.66. Cost of the system for the year: for pay of teachers, \$1,273,931.53; for all other current expenses, \$213,016.13; for permanent improvements, \$150,035.18.

Charities.—At the Southwestern Lunatic Asylum, at Marion, there were 248 patients on Sept. 30, 1890; 129 patients were admitted during the year ensuing, and 113 discharged, leaving 264 remaining on Sept. 30, 1891. The average number during the year was 256. The number of patients at the Eastern Lunatic Asylum on Sept. 30, 1890, was 402. The admissions during the year following were 92, and the number discharged 73, leaving 421 on Sept. 30, 1891. The average for the year was 411.

Penitentiary.—At the end of the fiscal year, 1891, there were 1,192 convicts in the State

Penitentiary, divided as follows: white men, 212; colored men, 890; white women, 2; colored women, 95. The earnings of convicts for the year exceeded the expenses of the institution by \$36,170.18.

Tobacco.—According to the Federal census of 1890, the total number of tobacco planters in the State during the census year was 24,034; the total area devoted to tobacco, 110,579 acres; the total product, 48,522,655 pounds; and the value of the crop to the producer, \$4,323,649.

Coal.—The total output of coal in the State during the year ended June 30, 1880, as reported to the tenth census, was 43,079 short tons of bituminous coal, valued at \$99,802 at the mines, and 2,817 short tons of anthracite, valued at \$8,290 at the mines. During the calendar year 1889 the quantity of bituminous coal mined in the State, as reported to the eleventh census, was 865,786 short tons, valued at \$804,475, an average of 93 cents a ton at the mines. This great increase during the decade is attributed to the developments in the Flat Top and Clinch Valley districts. The total number of employes engaged in or about coal mines in 1889 was 1,555; the amount of wages paid them was \$621,266; and the expense of mining the product of that year, \$681,476.

Legislative Session.—The biennial session of the General Assembly began on Dec. 2. Early in the proceedings, Secretary Flournoy, First Auditor Marye, Second Auditor Ruffin, Treasurer Harmon, and Railroad Commissioner Hill were re-elected. On Dec. 15 United States Senator John W. Daniel, Democrat, was re-elected for the full term of six years, receiving all the votes cast in each House. The one Republican Senator and the two Republican Assemblymen did not vote. At the close of the year the session had not been completed.

Debt Settlement.—The year 1891 will be notable in the history of Virginia as marking the termination of the long-standing controversy between the State and its bondholders. By a joint resolution passed on March 5, 1890, the Legislature had offered to reopen negotiations with the bondholders, and had appointed for that purpose a commission, consisting of the Governor, the Lieutenant-Governor, and a few members of the Senate and House of Delegates. This commission was authorized to agree with representatives of the bondholders upon any terms of settlement, provided they were not less favorable to the State than the provisions of the Riddleberger act. Early in May, 1891, the Governor received a communication from a committee representing a large majority of the bondholders, asking for a conference at an early day, and June 2 was fixed upon for the meeting. At this time the committee submitted the following statement and proposition: "Of the debt proposed to be funded there is now outstanding, owned by the public, an apparent maximum, as of July 1, 1891, approximating \$28,000,000. Of this amount the bondholders' committee control not less than \$23,000,000 (principal and interest), to said date; and the committee hereby proposes to surrender the same, together with any additional obligations which may be deposited, on the basis of \$20,000,000 of new 3-per-cent. bonds for the entire \$28,000,000." This proposal the

Virginia commission, under date of June 3, refused to accept, on the ground that it had no authority to do so, and that the State would be unable to raise from its revenues a sum sufficient to meet, with other necessary expenses, the accruing annual interest required by such a settlement. Later in the year a second conference was arranged for Nov. 17, and on that day the bondholders' committee submitted an amended proposition, saying that "the committee proposes to surrender, as of July 1, 1891, not less than \$23,000,000 (principal and interest), for such a proportion of \$19,000,000 of new 3-per-cent. bonds as the amount surrendered bears to \$28,000,000." This proposition also was rejected by the commission. Thereupon a sub-committee of two from the commission was appointed to confer with a sub-committee of two from the bondholders' committee, with a view of arriving at some basis for further negotiation. As a result of this action, the Virginia commission, on Nov. 18, suggested to the committee a willingness to report favorably to the Legislature a proposition to settle the outstanding unsettled debt on the basis of an issue of new bonds, not to exceed a maximum of \$18,000,000, to be exchanged for outstanding unsettled obligations in the proportion of 18 to 28; such new bonds to run one hundred years, and to bear 2 per cent. interest for ten years and 3 per cent. for ninety years. In reply to this suggestion, the bondholders' committee said they would communicate it to their depositing security-holders, but would not advise its acceptance. Continuing, the committee said: "We will, however, cheer-

fully recommend either of the following propositions: A 3-per-cent. one hundred-year bond, similar in form and features to the Riddleberger bonds, for \$18,000,000; or a bond similar in form and feature to the Riddleberger bonds, for \$19,000,000 at one hundred years, the first five years' interest to run at 2 per cent., the next five at 2½ per cent., the balance of the term, 3 per cent." In reply to this, the commission, on Nov. 19, offered to report favorably to the Legislature the \$19,000,000 proposition, provided it should be so modified as to restrict the interest annually payable to 2 per cent. for ten years, and 3 per cent. for the remaining ninety years; the bonds and interest obligations to be of the same general character as those provided by the Riddleberger bill, and it being distinctly understood that the coupons or other interest obligations are not to be receivable for taxes. This last proposition the bondholders' committee agreed to recommend to their constituents, and the conference thereupon ended. On Dec. 18 a meeting of the British bondholders was held in London, at which the terms of the proposed settlement were discussed, and the meeting, by a vote of 39 to 17, agreed to accept the action of the committee. This vote was communicated to the Virginia commission, and on Jan. 14, 1892, Gov. McKenney transmitted to the Legislature a special message, containing the report of the commission, and advising the ratification of the terms agreed upon.

Later in the session the Legislature accepted the settlement, and passed an act providing for the issue of new bonds.

W

WASHINGTON, a Pacific coast State, admitted to the Union Nov. 11, 1889; area, 69,180 square miles; population, according to the census of 1890, 349,390. Capital, Olympia.

Government.—The following were the State officers during the year: Governor, Elisha P. Ferry, Republican; Lieutenant-Governor, Charles E. Laughton; Secretary of State, Allen Weir; Treasurer, A. A. Lindsley; Auditor, T. M. Reed; Attorney-General, W. C. Jones; Superintendent of Public Instruction, R. B. Bryan; Commissioner of Public Lands, W. T. Forrest; Chief Justice of the Supreme Court, T. J. Anders; Associate Justices, Elmore Scott, R. O. Dunbar, T. L. Stiles, J. P. Hoyt.

The Senate consists of 30 Republicans and 4 Democrats; the House, of 61 Republicans and 17 Democrats.

Legislative Session.—The regular biennial session of the Legislature was held in January. The most important action taken was the passage of a bill to reduce certain freight rates on railroads. Gov. Ferry was absent from the State, and Lieut.-Gov. Laughton, acting as Governor, vetoed the bill. In his veto message he gave his reasons for not approving the measure, as follow:

1. It is unconstitutional.
2. It is contrary to the established principles of law in force in this State.
3. It is a bill which will work an injury to the

State, to the development of its interests, and to its people.

1. The law is unconstitutional, because it is class legislation. It favors the producer of wheat, flour, barley, and mill stuffs, and discriminates against the producer of other products, and against the other citizens of our State who may desire to ship any other class of freight over the lines of a common carrier within the State. It places a railroad company in such a position as to violate section 15 of Article XII of the State Constitution, which prescribes that "No discrimination in charges or facilities for transportation shall be made by any railroad or other transportation company between places or persons." It is also in direct violation of section 18 of Article XII of the Constitution, which prescribes that "The Legislature shall pass laws establishing reasonable maximum rates of charges for the transportation of passengers and freight, and to correct abuses and to prevent discrimination and extortion in the rates of freight." Instead of preventing this discrimination between rates of freight, the bill, by its expressed terms, discriminates in the most palpable manner. Again, the Legislature in passing this bill has not passed a law "establishing reasonable maximum rates of charges for the transportation of passengers and freight," but it has passed a bill establishing a maximum rate of charges for certain commodities or products alone, which, when taken together with all other products of the State requiring transportation, constitute "freight" as contemplated in section 18. The act is therefore in plain and open violation of the provisions hereinbefore quoted from sections 15 and 18 of Article XII of the Constitution. It being unconstitutional, it requires neither legal authority nor further

argument to justify the assertion that it should not become a law.

2. There are other valid legal grounds why such a law should not be passed. The Congress of the United States has created an interstate commerce commission which has power to regulate freight rates and adjust the grievances, if any there be, which are attempted to be adjusted by the bill under consideration. An act such as this not only discriminates against citizens of the State, but it discriminates against citizens in the neighboring States of Idaho and Montana, who produce the same commodities as those mentioned in the bill and who are compelled to ship such products to coast points for transportation to market, or suffer a loss by shipping them a greater distance to Eastern points. Common carriers, under this act, charge the producer of wheat, barley, flour, and mill stuffs, who reside in Montana or Idaho a much greater rate than the producer of the same commodities in this State. Under the laws of comity between States, and under the principle which should govern legislation in all matters where State power is brought into conflict with the Federal power, it is but justice and right that the legislative and executive power of a State should, as far as possible, assist the citizens of its sister States and the legislative and executive power of the United States, in guaranteeing to protect the citizens of such sister States against unjust discrimination and infringement upon legislation already prescribed by Congress for their protection. In my opinion, this law, instead of taking such a course, materially injures and curtails the rights of the citizens of the sister States in protecting themselves from such discrimination, and it certainly conflicts with the provisions of the act of Congress known as the Interstate Commerce act. It becomes thereby an infringement upon those rules of policy and law which should always exist between the States, and between the States and the United States. It is therefore specially within the province of the executive of a State to advise against the enactment of such a law.

Education.—In the school year 1890-'91 the school census numbered 100,552 persons, an increase of nearly 14 per cent. over the preceding year. The enrollment was 69,737, an increase of nearly 25 per cent. Franklin County has the smallest school population, 96, and King County the largest, 15,484. The number of school-houses built during the year was 235, the total number now in the State being 1,275. The value of school property is over \$3,000,000. The average salaries of teachers are: Men, \$52 a month; women, \$42. The current expenses of the schools during the year aggregated \$932,491. The indebtedness of the school districts is over \$3,000,000. The State Normal School, at Ellensburg, was opened in September. Olympic University (Congregational), at Olympia, has entered into a contract for the erection of buildings, which are to be completed before May 1, 1893.

Fruits.—The Secretary of Agriculture, in a recent report, says: "In eastern Washington, along the river valleys and foot hills that separate that State from Idaho, a great stretch of semi-humid land exists, in which the culture of temperate fruits, small berries, and valuable garden products is already being brought to a high degree of perfection. The display of fruits in the orchards already existing there is simply astonishing as to size, quantity, and quality. In the valley of Salmon and Snake rivers, of the Columbia, and other streams in Idaho, eastern Washington, and Oregon, a large number of bores have been made at quite high altitudes,

and during the year 35 or 40 artesian wells have been sunk for water, which rises with great pressure and flows with considerable volume.

Borax Beds.—Extensive beds of borax in Douglas County, which were discovered in 1875, were unworked and unclaimed until the summer of 1891, when work was begun upon them. There is a solid deposit of borax 8½ feet thick, having the appearance of a lake a mile and a half long and half a mile wide. Wherever a hole is cut, a fresh deposit bubbles up from the bottom and fills it in a few hours. The borax is remarkably pure and translucent. It is said that there are in the vicinity abundant springs of fresh water unaffected by the salt deposit.

Precious Metals.—Wells, Fargo & Co.'s report of precious metals produced in 1891 gives the following figures for Washington: Gold dust and bullion by express, \$187,000; gold dust and bullion by other conveyances, \$30,000; silver bullion by express, \$112,000; total, \$329,000.

Industrial Fair.—The Western Washington Industrial Exposition was formally opened in Tacoma on Sept. 10, with an attendance of 6,000 people. The main building was 280 by 300 feet and two stories high, and was illuminated by 1,150 electric lights. It was divided into main exhibit hall, machinery hall, art gallery, ladies' fancy-work department, mineral department, historical and educational department, etc. The timber exhibit was especially fine. The building was erected in ninety days, and cost \$72,000. It is the property of a stock company.

The Columbian Exposition.—The State appropriated \$50,000 for the year 1891 for an exhibit at the Chicago World's Fair. This is to be managed by a commission consisting of one man from each county. The Governor has the power to remove any member for sufficient cause, but all vacancies are filled by the commission. In order to facilitate matters the members appointed a commissioner, whose salary shall not exceed \$150 a month, who will exercise all the executive powers and functions that may be necessary to secure a complete and creditable display. He is to have personal charge of the solicitation, transportation, arrangement, and exhibition of the objects sent to the exhibition, but, of course, under the supervision of the commission. The State Mining Bureau will co-operate with the commissioners, and will forward all the mineral collections and cabinets belonging to the State.

Destructive Storms.—On Dec. 7 a great storm swept over Clallam County, which lies along the southern border of the Strait of Juan de Fuca. Thousands of forest trees were prostrated, square miles were covered with tangled masses of timber. The new county road, which had just been completed at a cost of \$100,000, was almost destroyed. The total loss was estimated at millions of dollars. On Dec. 28 another terrible storm occurred, which did much damage to the shipping on Puget Sound.

Tide Lands.—Section 1 of Article XVII of the State Constitution declares that "the State of Washington asserts its ownership to the beds and shores of all navigable waters in the State up to and including the line of ordinary high tide in

waters where the tide ebbs and flows, and up to and including the line of ordinary high water within the banks of all navigable rivers and lakes: *Provided*, That this section shall not be construed so as to debar any person from asserting his claim to vested rights in the courts of the State." But Judge Hanford, in a decision of the court at Tacoma, decided that the tide lands are owned by the United States Government, and not by the State of Washington.

Naval Station.—A new United States naval station was established at Port Orchard in September. One hundred and forty five acres have been taken by the Government, and additional land will probably be acquired. Preliminary surveys and borings for the construction of a dry dock were made. The official name is Puget Sound Naval Station.

WEST INDIES. The islands of the Greater and Lesser Antilles, with the exception of the Spanish colonies of Cuba and Puerto Rico and the island of Hayti occupied by the two black republics, are dependencies of Great Britain, Denmark, France, and the Netherlands.

Jamaica.—The island of Jamaica is a partly self-governing British colony, having a Legislative Council presided over by the Governor, in which 9 members are elected—5 are nominated by the Crown and 4 are official. The present Governor is Sir Henry Arthur Blake. The area of Jamaica is 4,193 square miles, and the population in 1891 was 639,491. Dependencies of the colony are Turk's and Caicos islands, with an area of 223 square miles and 4,778 inhabitants, and Cazman islands, with an area of 225 square miles and 2,400 inhabitants. Kingston, the capital, has about 40,000 inhabitants. Jamaica in 1881 had 14,432 white inhabitants, 109,946 of mixed blood, 444,186 negroes, and about 12,000 Chinese and Indian coolies. The revenue in 1889 was £695,000 and the expenditure £646,000, as estimated in the budget. There is a debt of £1,588. The imports in 1889 were valued at £1,598,000 and the exports at £1,615,000. The tonnage entered and cleared was 1,075,000 tons, exclusive of coasters. There are 93 miles of railroad and 698 miles of telegraphs. The number of letters that were sent through the post-office in 1888 was 1,408,453. The commerce is chiefly with Great Britain and with the United States. The new commercial treaty admitting Jamaican sugar and coffee free into the United States is favorable to the development of trade with American ports, as 63 articles of American produce and manufacture are by its terms admitted free of duty and 12 others at reduced rates. American cars and locomotives and many articles of ordinary consumption have already displaced British manufactures. The values of the leading exports in 1888 were as follow: Coffee, \$1,555,769; logwood, \$1,709,265; raw sugar, \$1,395,865; bananas, \$1,320,052; rum, \$979,712; oranges, \$313,046; pimento, \$216,483; ginger, \$94,200.

Leeward Islands.—The group, which is divided into 5 presidencies, is under control of a Governor, at present Sir William Frederick Haynes Smith, who is assisted by an Executive Council and a Federal Legislative Council consisting of 10 elected and 10 nominated members. The area of the islands and their population in 1881 were as follow:

ISLANDS.	Square Miles.	Population.
Virgin Islands.....	64	1,207
Anguilla.....	35	8,219
St. Kitts.....	69	19,717
Nevis and Redonda.....	46	11,764
Barbuda.....	78	14,964
Antigua.....	67	74,964
Montserrat.....	82	11,450
Dominica.....	291	29,740
Total.....	706	124,760

* In 1889.

† In 1884.

There were about 5,000 white, 23,000 colored, and 94,000 black inhabitants in 1884. In most of the islands sugar and molasses are the main products. In some, fruit growing is increasing. Other products are salt and phosphate of lime. The treasury in the Virgin islands received £2,000 and disbursed an equal sum in 1889; the imports were valued at £3,000 and the exports at £4,000. The revenue of St. Kitt's and Nevis was £40,000 and expenditure £38,000; imports, £178,000; exports, £343,000. Antigua had a revenue of £43,000 and imported merchandise of the value of £166,000, while the exports amounted to £267,000. In Montserrat the revenue was £6,000; the imports were valued at £25,000 and the exports at £28,000. Dominica had a revenue of £21,000; imports, £57,000; exports, £47,000. The public debt of these colonies was increased from £80,819 to £91,631 during the course of that year. In 1891 there was a total failure of food crops in Anguilla, owing to drought.

Windward Islands.—The Windward group has a common Governor, Sir W. F. Holy-Hutchinson, but no federal legislative body. Each colony has an administrator and a Legislative Council, the members of which are officials and persons nominated by the Crown. Grenada, with an area of 166 square miles and a population in the beginning of 1890 of 50,393, including 1,961 coolies, had a revenue of £50,000 and £51,000 of expenditures in 1889. The imports amounted to £174,000 and the exports to £196,000. St. Vincent, with an area of 147 square miles and 47,933 inhabitants in 1890, had a revenue of £28,000, while the disbursements were £22,000. The imports were £98,000 and the exports £125,000. St. Lucia is 237 square miles in extent and contains 43,685 inhabitants. The treasury receipts in 1889 were £48,000; disbursements, £46,000; imports, £172,000; exports, £162,000. Sugar, rum, cacao, pine-apples, and other fruits, spices, logwood, cotton, coffee, arrow-root, and timber are among the products. Cotton and coffee have to some extent displaced sugar-cane.

Bahamas.—The area of the Bahamas is 5,390 square miles. The population in 1889 was 45,500. The white population in 1881 was 11,000. Nassau, the capital, has 5,000 inhabitants. The Governor is Sir Ambrose Shea. He is assisted by an Executive Council and a Legislative Council, each of 9 members, and there is a Legislative Assembly of 29 members elected under a low property limitation by popular suffrage. The revenue in 1889 was £46,000 and the expenditure £48,000. In 1890 the revenue was £51,826 and expenditure £48,688. There was a deficit of £83,000. The imports were valued at £176,000 and the exports at £130,000. In 1890 the imports showed an increase of 38 per cent. and the ex-

ports of 35 per cent., the value of the former being £222,512 and of the latter £168,121. This development is due almost entirely to the extension of the new sisal-fiber culture. There were 4,100 acres planted with 2,500,000 of the plants in 1890, and 1,300,000 more plants were growing in nurseries. The plants take three years more to mature in the nursery. Apart from this the chief product of the soil is the pine-apple. Cotton is grown to a small extent, and sweet potatoes and corn are raised for home consumption. Oranges also are exported, and fruit culture is increasing. Sponge-fishing, formerly the chief industry, is carried on by the natives, who also gather conch shells, pearl shells, turtles, and ambergris. The value of sponges obtained in 1889 was £51,886. In 1890 the amount realized was £63,099. The export of fresh pine-apples was valued at £25,553, and that of preserved pine-apples at £4,500. In 1890 the export of pine-apples rose to £49,795, and that of the canned fruit to £6,126. The export of oranges was £3,961, as compared with £3,040 in 1889. The value of the cotton crop increased from £1,074 to £1,593. In 1891 mail steam communication between the several islands was established. A cable to connect the islands with Florida and the telegraph system of the world had been decided on. The development of the cultivation of sisal fiber is likely to make an extraordinary difference in the position which this group of rocks and islands has hitherto held among British possessions. The conversion of what was once looked upon as a useless weed into a source of wealth has been sudden. Only four years ago the natives were complaining of the impossibility of eradicating the aloe-like shrub from the lime soil of their plantations. It grew wild everywhere; its long, intractable leaves obtruded themselves in the midst of every crop; the most determined efforts at repression were unavailing. The commercial experience of Sir Ambrose Shea enabled him to perceive the possible value of such a fiber as that contained in the sisal leaves. Experts from Newfoundland were the first to confirm the opinion which he had formed of the fiber. It was recognized as possessing qualities equal to those of the best rope fibers. Negotiations were entered into for its cultivation. Early in 1890 a bounty amounting to £4 10s. per ton exported was granted for a period of several years, and capital began to flow into the islands. Government lands which had previously been regarded as waste were taken up for the cultivation of the fiber, and the price of them was raised from 5s. to £4 an acre. Investors were promised that not more than 100,000 acres would be allotted to this culture for the first ten years. Within a year and a half this quantity of land had been taken up. It has been found that an acre of land will produce a yearly crop of about half a ton of fiber. The sisal plants last from twelve to fifteen years. They are planted in rows with young ones coming between them, so that the crop is practically self-renewing, while the soil is inexhaustible. The preparation for market consists simply in crushing the leaves through rollers and washing away the juicy matter which is thus reduced to pulp. Very little labor is required, and, while the price of the fiber ranges up to £34 a ton, the cost of production and delivery averages about £12.

From the nature of the cultivation, which demands little outlay of capital, it is presumable that the laboring population of the islands will desire to take part in it on their own account, and provision has been made that any native head of a family who is not already in possession of land may, upon application to the Government, receive a grant of 10 acres at the old price of 5s. an acre, to be paid out of the first year's crop. These grants are outside the 100,000-acre limit, but, in order to guard the natives from the temptation to sell as soon as the price of land is found to rise, they are made in the form of an untransferable license of occupation which must run for twenty years before the freehold title can be acquired. From the sale of Government land a fund of £50,000 has been created which is available for the purposes of public works.

Barbadoes.—The island of Barbadoes has an area of 166 square miles. The population in 1889 was 182,000. The Governor now in office is Sir Walter J. Kendall. There is, besides an Executive and a Legislative Council, a House of Assembly of 24 members elected annually by the colonists. The receipts of the Government in 1889 were £175,000, and the expenses £146,000. The imports amounted to £1,211,000, and the exports to £1,030,000. Sugar is the staple product, and since the colonial sugar was supplanted in the English market by bounty-fed beet sugar the bulk of the crop, from 87 to 95 per cent., has gone to the United States. American flour has been used by the islanders to the exclusion of all other sorts, and from this and the imports of meat, bread, salted meats, horses, mules, oil, corn, oats, meal, butter, cheese, lard, kerosene, and staves and shooks, duties have been collected amounting to £37,000 a year. In order to secure the benefits of the reciprocity clause of the McKinley tariff act the Government has removed or reduced these duties.

Trinidad.—Trinidad and its dependency, Tobago, lie near the mouth of the Orinoco river. The Governor is Sir William Robinson. The government is that of a Crown colony. The area of Trinidad is 1,754 square miles, that of Tobago 114 square miles. The former had 196,172 and the latter 20,626 inhabitants in 1889. The products are sugar, cacao, coffee, pea-nuts, cocoa-nuts, and asphaltum, which is obtained from a large pitch lake in the center of the island. Fruit growing is on the increase, and the cultivation of the hemp fiber has been started. In Tobago, which was annexed to Trinidad in 1889, cotton and tobacco have begun to be cultivated. The revenue in 1889 was £453,000, and the expenditure \$463,000. The imports were valued at £2,094,000, and the exports at £2,309,000. The immigrants, who are chiefly coolies from Madras, numbered 3,252, and the emigration was 688. Commerce with the United States has in late years grown at the expense of the trade with Great Britain and British possessions. The trade with the United States increased from £591,557 in 1881 to £1,153,563 in 1890, or from less than one eighth to more than one fourth of the whole trade of the colony. The tonnage entered and cleared has increased from 877,611 to 1,276,970 tons in ten years. Trinidad has 54 miles of railroads and 717 miles of telegraphs.

The Danish Antilles.—The possessions of Denmark consist of three small islands. Santa Cruz or St. Croix has an area of 74 square miles, and a population of 18,430 individuals, of whom about 5,000 are white. St. Thomas has an area of 23 square miles, and 14,389 inhabitants, according to the preliminary returns of the census of Feb. 1, 1890. St. John, with an area of 21 square miles, had at the same date a population of 944. Christian Hans Arendrup has been Governor since 1881. He is assisted by an Executive Council and by a Legislative Council consisting partly of elective and partly of nominated members. St. John and St. Thomas have a Colonial Council in common, and St. Croix a separate one. The principal products of St. Croix are rum, sugar, and molasses. St. Thomas has a rich soil, producing vegetables and fruits in great variety, and tobacco and coffee of fine quality. This island is a free port. The steamships of the European and American lines stop there, and Charlotte Amalia, a town of 13,000 inhabitants, is the chief commercial depot for many of the West Indian islands. The commerce of the islands is chiefly with Denmark, the United States, and Great Britain. In the year ending June 30, 1890, the United States imported from the Danish colony merchandise of the value of \$588,739, and exported to the islands goods of the value of \$794,293. The total imports into St. Thomas for the year ending March 31, 1889, were \$1,126,000, of which \$343,000 came from the United States and an equal amount from Great Britain.

The French Colonies.—Guadeloupe, in the Lesser Antilles, has an area of 360 square miles and a population of 182,182. The Governor is assisted by a Legislative Council, the members of which are elected. The chief town is Pointe-à-Pitre, with a population of 15,172. The political capital, Basse Terre, has 9,500 inhabitants. The receipts in 1889 balanced expenditures and amounted to 5,027,130 francs. The expenditure of France was 2,122,085 francs in 1890. There is a debt of 1,000,000 francs. There are 60 miles of railroad. The trade is mainly with France and the United States. The total value of the imports in 1889 was 24,700,000 francs, and that of the exports 23,500,000 francs. The products are sugar, coffee, cacao, vanilla, spices, manioc, yams, rice, maize, vegetables, tobacco, ramie fiber, cotton, India-rubber, cabinet woods, anatto, sheep, pigs, and cattle. The dependencies of Guadeloupe are the islands of La Désirade, Les Saintes and Petite-Terre, Marie Galante, St. Barthélemy, and San Martin, with a combined area of 100 square miles and 23,605 inhabitants.

Martinique, in the Caribbean Sea, has an area of 380 square miles. The population in 1888 was 175,863. St. Pierre, the chief town, had 18,707 inhabitants. The chief product is sugar. All tropical fruits and vegetables grow prolifically, and bananas are an important article of export. The chief imports are flour, fertilizers, rice, salted fish, and cotton goods. The exports consist mainly of sugar and liquors. The total value of the imports in 1888 was 22,900,000 francs, and that of exports 21,500,000 francs. There are 120 miles of railroad. The receipts and expenditures in 1889 balanced at

3,523,227 francs. The expenditure of the home Government was 2,006,533 francs in 1890. The colony is administered by a Governor, and has an elective General Council.

The Dutch Antilles.—The Dutch colony of Curaçao consists of the islands of Curaçao, Bonaire, Aruba, a part of San Martin, St. Eustache, and Saba. Curaçao has an area of 210 square miles and 25,877 inhabitants. Bonaire, with an area of 95 square miles, has 4,701 inhabitants; Aruba, 69 square miles in extent, has 7,365; the Dutch or southern part of San Martin supports 4,431 people on 17 square miles; and St. Eustache and Saba, one 7 and the other 5 square miles in extent, are peopled respectively by 1,563 and 2,524 persons. The colony is administered by a Governor, who is assisted by a Council composed of four members nominated by the Crown, one being the Attorney-General. The revenue for 1890 was 597,000 guilders, as estimated in the budget, and the expenditure was 672,000 guilders, the deficiency being supplied by the home Government. The budget for 1891 makes receipts and expenses balance at 681,211 guilders. The imports in 1887 were valued at 3,240,006 guilders, and the exports of the smaller islands at 510,200 guilders. In 1888 the imports were 2,819,211 guilders, and the exports, exclusive of Curaçao, 569,314 guilders. The chief products are corn, beans, cattle, lime, salt, and fruits. The rinds of oranges are shipped to Holland, where they are used for the manufacture of the liquor known as Curaçao. In 1889-'90 the imports from the Dutch Antilles into the United States were \$194,636 in value, and the exports from the United States to those islands were \$609,693.

WEST VIRGINIA, a Southern State, admitted to the Union June 19, 1863; area, 24,780 square miles; population in 1890, 762,794. Capital, Charleston.

Government.—The following were the State officers during the year: Governor, A. B. Fleming; Secretary of State, William A. Ohley; Treasurer, William G. Thompson; Auditor, Patrick F. Duffey; Attorney-General, Alfred Caldwell; Superintendent of Free Schools, Benjamin S. Morgan; Adjutant-General, B. H. Oxley; President of the Supreme Court, Daniel B. Lucas; Judges, Henry Brannon, J. W. English, H. A. Holt; Clerk, O. S. Long—all Democrats.

The Senate consists of 16 Democrats and 10 Republicans; the House, of 44 Democrats and 21 Republicans.

Finances.—The total debt, less the sinking fund, in 1890 was \$184,511, against \$127,511 in 1880. The bonded debt in 1890 was \$135,511; the floating debt, \$49,000. The debt *per capita*, therefore, less the sinking fund, in 1890 was 24 cents, against 21 cents in 1880. The State's appropriation to the World's Fair at Chicago amounts to \$40,000, being \$20,000 more than the appropriation made for the Centennial Exposition of 1876.

Board of Health.—Gov. Fleming appointed, May 28, 1891, for First District, Dr. William M. Late, Bridgeport, Harrison County, for the term ending June 1, 1894; Dr. L. D. Wilson, Wheeling, for the term ending June 1, 1895. Second District, Dr. L. S. Brock, Morgantown, for the

term ending June 1, 1893. Third District, Dr. B. F. Irons, Pickaway, Monroe County, for the term ending June 1, 1893. Dr. W. P. Ewing, Charleston, for the term ending June 1, 1894. Fourth District, Dr. I. P. Carpenter, Pocahontas County.

Education.—The per cent. of gain in public-school enrollment to June 26, 1891, was 34.42, while the gain in population was 23.34. In Charleston, the enumeration for 1890 was 2,128, and the attendance 1,548.

On June 23, 1891, the Board of Education for the independent district of Charleston resolved to advertise an election asking for bonds for \$30,000, of which \$10,000 are to be used for a school-house for colored children.

To the West Virginia Colored Institute Gov. Fleming appointed, on May 28, 1891, as regents, Benjamin W. Byrne and Benjamin F. Wyatt, Charleston; Charles H. Turner, Parkersburg; John A. Myers, Morgantown; and Samuel P. Haven, Glen Easton, Marshall County. On May 28, 1891, he appointed to the board of regents for the schools for the deaf and the blind, W. S. Wiley, New Martinsville, Wetzel County, to fill a vacancy caused by the death of Dr. Baird; D. C. Casto, Elizabeth, Wirt County, to fill a vacancy caused by the resignation of W. P. Vicars.

Agriculture.—The first State board met at the Capitol in Charleston on May 4, 1891. President, H. M. Turner; Secretary, Secretary of the State Grange. On May 14 the Secretary of the Interior, at Washington, certified to the Treasury the warrant for \$15,000, being the money due to West Virginia as her share of the money appropriated for the support of agricultural colleges for the fiscal year ending in June, 1890. The delay in payment was due to the raising of a question as to the discrimination against colored pupils in the West Virginia College. The money for 1891 will be paid when the report is submitted as to the disposition of the money appropriated for 1890.

Game Laws.—The following amendments to the game laws have been passed: No quail (Virginia partridge) from Dec. 20 to Nov. 1; wild turkey, Jan. 1 to Sept. 15; ruffed grouse, pheasant, pinnated grouse, prairie chicken, etc., Jan. 1 to Nov. 1; duck, wild duck, woodchuck, blue-winged teal, etc., April 1 to Oct. 1; snipe, only between March 1 and July 1; woodcock, only from July 1 to Sept. 15. It is made unlawful at any time to entrap, seine, or destroy any Virginia partridge, and, except by shoulder gun, to hunt.

World's Fair Commission.—The commission appointed to take charge of West Virginia's exhibit at the Columbian Exposition is as follows: Governor, Hon. W. N. Chancellor (at a salary of \$1,200 per annum); Treasurer, Hon. George M. Bowers (1 per cent. on the disbursements); Secretary, W. C. McKay (\$600 per annum).

Coal.—According to the annual report of the State Mine Inspectors during the year ending June 30, 1891, the total coal production was 7,381,430 tons of 2,240 pounds each. The coke production was 1,238,418 tons. There were 179 mines in operation, in which 14,178 men were employed. There were 4,117 coke ovens in operation, and 777 more were in process of building. The average number of months worked was

104; the average earnings of miners per month, \$39.25.

Petroleum.—Out of a total production of 34,820,306 barrels of petroleum in the United States in 1889, West Virginia, according to a bulletin of the Census Office, produced 358,269. Oil was produced in eleven States, West Virginia coming fourth on the list.

Land.—Five thousand acres of timber land in Preston County were sold this year for \$50,000 to a Philadelphia syndicate.

WISCONSIN. a Western State, admitted to the Union May 29, 1848; area, 56,040 square miles. The population, according to each decennial census since admission, was 305,391 in 1850; 775,881 in 1860; 1,054,670 in 1870; 1,315,497 in 1880; and 1,686,880 in 1890. Capital, Madison.

Government.—The following were the State officers during the year: Governor, George W. Peck, Democrat; Lieutenant-Governor, Charles Jonas; Secretary of State, Thomas J. Cunningham; Treasurer, John Hunner; Attorney-General, James L. O'Connor; Superintendent of Public Schools, Oliver E. Wells; Insurance Commissioner, Wilbur M. Root; Railroad Commissioner, Thomas Thompson; Chief Justice of the Supreme Court, Orsamus Cole; Associate Justices, Harlow S. Orton, John B. Cassoday, William P. Lyon, and David Taylor, who died on April 3 and was succeeded on May 4 by John B. Winslow, by appointment of the Governor.

Legislative Session.—The regular biennial session of the General Assembly began on Jan. 14 and ended on April 25. Both Houses were controlled by the Democrats. On Jan. 27 William F. Vilas, Democrat, was elected United States Senator for the term of six years, to succeed John C. Spooner, Republican, the vote in each House being as follows: Senate, Spooner 14, Vilas 16; House, Spooner 31, Vilas 66. The Bennett school law of 1889, which was bitterly assailed during the political contest of 1890, was repealed early in the session and a new compulsory education law was enacted, which provides that "every parent or other person having under his control any child between the ages of seven and thirteen years shall cause such child to attend, for at least twelve weeks in each and every school year, some public or private school; provided, however, that this act shall not apply to any child that has been or is being otherwise instructed for a like period of time in the elementary branches of learning, or that has already acquired such knowledge, or whose mental or physical condition is such as to render his or her attendance at school and application to study inexpedient or impracticable, or who lives more than two miles from any school by the nearest traveled road, or who is excused for sufficient reasons by any court of record. Every person who shall violate the provisions of this section shall, upon conviction thereof, be fined in any sum not less than three dollars nor more than twenty dollars for each and every offense." The local school officials were required to prosecute offenses under this act, and they may appoint officers to apprehend truants.

In order to put an end to the practice of State Treasurers in collecting for their own use the interest on public moneys which they had depos-

ited in banks at their own risk and without warrant of law, an act was passed giving the Treasurer legal authority to deposit in certain banks at the risk of the State, and requiring that in such cases the interest be turned over to the State. Any person who shall hereafter give or pay to any State Treasurer interest on deposits or any other sum of money, except as expressly authorized by law, shall be deemed guilty of bribery. By another act the Commissioners of Public Lands, with the approval of the Governor, were authorized to settle any claims of the State against past State Treasurers arising out of their retention of interest on public moneys.

The State was redistricted for members of the Senate and Assembly, and the following new congressional districts were established:

First.—The counties of Racine, Kenosha, Walworth, Rock, Green, and Lafayette.

Second.—Counties of Jefferson, Dodge, Dane, and Columbia.

Third.—Counties of Adams, Juneau, Vernon, Sauk, Richland, Crawford, Grant, and Iowa.

Fourth.—The First, Second, Third, Fourth, Fifth, Sixth, Seventh, Eighth, Ninth, Eleventh, Twelfth, Fourteenth, Fifteenth, Sixteenth, Seventeenth, and Eighteenth Wards of the city of Milwaukee, and the towns of Franklin, Greenfield, Lake, and Oak Creek in Milwaukee County.

Fifth.—Counties of Sheboygan, Ozaukee, Washington, and Waukesha, and the Tenth and Thirteenth Wards of the city of Milwaukee, and the towns of Granville, Milwaukee, and Wauwatosa in Milwaukee County.

Sixth.—Counties of Waushara, Marquette, Green Lake, Fond du Lac, Winnebago, Calumet, and Manitowish.

Seventh.—Counties of Pepin, Eau Claire, Buffalo, Trempealeau, Jackson, Monroe, and La Crosse.

Eighth.—Counties of Wood, Portage, Waupaca, Outagamie, Brown, Kewaunee, and Door.

Ninth.—Counties of Clark, Taylor, Price, Ashland, Oneida, Lincoln, Marathon, Shawano, Langlade, Forest, Florence, Marinette, and Oconto.

Tenth.—Counties of Bayfield, Douglas, Burnett, Sawyer, Washburn, Polk, Barron, Chippewa, St. Croix, Dunn, and Pierce.

A ballot-reform law enacted at this session applies to all elections except those for town and village officers and those held in cities of 50,000 inhabitants or more.

The employment of children under fourteen years of age in any mine, factory, workshop, or place of public entertainment and amusement was forbidden except in certain cases, when the county judge may license children over twelve years to work in such places.

An act abolishing the State board of supervision of the charitable, reformatory, and penal institutions, and the State Board of Charities and Reform, provides that the duties of these boards shall be discharged by a State board of control, created by the act, whose members shall be appointed by the Governor. The offices of State fish wardens and State game wardens were abolished and the enforcement of the fish and game laws intrusted to a State fish and game warden, to be appointed by the Governor. A State Board of World's Fair Managers was established, and the sum of \$65,000 appropriated for its use.

In addition to the regular annual tax of one eighth of a mill for the State University the levy was authorized for six years of an annual

tax of one tenth of a mill, the proceeds to be devoted to the construction, maintenance, and equipment of an armory and drill room, a building for the College of Law, and a building for practical instruction in dairying, and for such other improvements as the board of regents shall deem suitable.

The following sums were appropriated to the State charitable and penal institutions: To the State Hospital for the Insane, \$116,000; to the Northern Hospital for the Insane, \$150,000; to the School for the Deaf, \$74,000; to the School for the Blind, \$46,000; to the Industrial School for Boys, \$100,000; to the State Public School, \$95,000; to the State Prison, \$6,000. The total appropriations of the session for all purposes aggregated \$931,476.18.

An amendment to the State Constitution proposed by the Legislature of 1889 prohibiting special laws for the incorporation of cities was agreed to at this session, and provision was made for its submission to the people in 1892. Congress was memorialized to propose an amendment to the Federal Constitution providing for the election of United States Senators by direct vote of the people.

Other acts of the session were as follow:

Distributing the money received as a refund of the direct tax of 1861 among the various funds of the State treasury.

Providing a new law for the enforcement of liens on logs and timber.

To prevent deception in the sale and use of imitations of dairy products.

To prevent the peddling or distributing of election tickets in cities of 150,000 inhabitants or over.

Requiring the Insurance Commissioner to establish a form of fire-insurance policy to be used by all fire-insurance companies in the State.

To prohibit discrimination by life-insurance companies in favor of individuals, between insureds of the same class and equal expectation of life, in the amount of premiums charged.

To provide for the incorporation of trust, annuity, guarantee, safe-deposit, and security companies.

To enable religious and church corporations to form fire-insurance companies for the purpose of insuring church property.

To protect associations and trade unions in the use of labels and trade-marks.

To create a pension fund for members of fire and police departments in cities of over 100,000 inhabitants.

Amending the game laws.

Changing the law relative to the property rights of married women.

Appropriating \$50,500 for improvements at the Veterans' Home at Waupaca.

To regulate the manufacture and sale of vinegar and to prevent its adulteration.

To provide for the organization of drainage districts, and for the construction, maintenance, and repair of drains, ditches, and levees.

To repeal all laws providing for the preservation and recount of ballots.

Regulating the business of mutual, beneficiary, and fraternal corporations, societies, and orders providing insurance on the assessment plan.

To prohibit the sale, transportation, and packing of unwholesome, stale, or putrid meat or the flesh of diseased animals.

To prohibit the sale or giving of any cigars, cigarette, or tobacco to any minor contrary to the order of the parent or guardian.

To provide for the regulation of primary elections in counties having a population of over 150,000.

To prevent the smoking of opium.

Assenting to the act of Congress approved Aug. 30, 1890, appropriating money for the more complete endowment and support of colleges of agriculture and the mechanic arts in the several States.

Making 4½ per cent. the minimum rate of interest on State trust funds.

Empowering married female lawyers to act as assignees, receivers, and court commissioners.

Permitting female lawyers to act as court commissioners.

Providing that when a man dies leaving no widow or minor children his homestead shall be subject to the payment of debts.

Authorizing a loan of \$150,000 to the State Agricultural Society with which to purchase fair grounds in Milwaukee.

Providing for the establishment of a sixth normal school.

Education.—The State University is one of the most successful institutions of its class in the United States. Its corps of instruction includes 62 professors and teachers, and its students during the year ending in 1891 numbered 1,097, divided among the several departments as follow: College of Letters and Science, 558; College of Mechanics and Engineering, 137; College of Agriculture, 67; College of Law, 118; School of Pharmacy, 56; Summer School, 131.

Charities.—The following figures show the number of insane in the asylums of the State on March 31: State Hospital, 513; Northern Hospital, 627; Milwaukee Hospital, 259; Brown County Asylum, 90; Columbia, 54; Dane, 101; Dodge, 104; Fond du Lac, 98; Grant, 103; Green, 84; Iowa, 103; Jefferson, 100; La Crosse, 106; Manitowoc, 99; Milwaukee, 120; Outagamie, 95; Racine, 102; Rock, 74; Sauk, 57; Sheboygan, 84; Vernon, 101; Walworth, 66; Winnebago, 70.

On the same date there were 184 pupils at the School for the Deaf, and 83 at the School for the Blind.

The number of inmates on Oct. 31 at the State Hospital was 523; at the Northern Hospital, 637; at the School for the Deaf, 176; and at the School for the Blind, 80.

Prisons.—On March 31 there were 536 convicts in the State Prison, 388 boys at the State Industrial School, and 273 children at the State Public School, at Sparta. On Oct. 31 the population at the State Prison was 530; at the Industrial School, 343; and at the State Public School, 283.

State Banks.—The following table presents a summary of the condition of the State banks on July 6, 1891, and Jan. 4, 1892:

ITEMS.	Jan. 4, 1892	July 6, 1891.
Capital	\$6,041,900 00	\$5,161,200 00
Deposits	38,523,302 16	87,304,842 15
Specie	1,104,970 26	1,156,209 74
Cash items	1,001,385 63	815,406 69
United States currency	8,039,254 01	2,258,961 37

The number of banks on the former date was 91, and on the latter date 104.

Agriculture.—According to the report of the Board of Agriculture there were raised in the State during the year 1891 13,543,000 bushels of wheat, on 966,128 acres, the value of the crop being about \$10,955,892. The corn crop was 29,718,000 bushels, raised on 1,113,842 acres, and

valued at \$13,076,017. The oat crop is reported at 49,348,000 bushels, raised on 1,481,419 acres, and valued at \$13,817,413.

Suits against ex-Treasurers.—For many years it has been the practice for each State Treasurer to deposit balances in his hands in certain banks, and to collect for his own use the interest thereon. This had been done by both Democratic and Republican Treasurers up to the present year, it being argued that, as the deposit was made at the Treasurer's own risk and not at the risk of the State, the person who took the risk, and not the State, ought to receive the benefit of the interest. In the political canvass of 1890 this question was considerably discussed, and it was generally agreed that the law should be so changed as to authorize and protect the Treasurer in depositing balances in his hands, and that the State should receive the accruing interest. The Democrats claimed that under the existing law the State had a right to the interest, and that former Treasurers had illegally converted it to their own use. Accordingly, after the election of November, 1890, the Democratic Attorney-General-elect announced that he should test the matter before the courts by entering suits against the living ex-Treasurers for a return of the interest. The first suit was begun against ex-Treasurer E. C. McFetridge, in February, 1891, and was soon followed by a suit against ex-Treasurer Henry B. Harshaw. In August similar suits were begun against ex-Treasurers Henry Baetz and Ferdinand Keuhn. The cases against McFetridge and Harshaw came to trial on Nov. 17 in the circuit court of Dane County, where the hearings occupied about two weeks. On Jan. 18, 1892, a decision was rendered in favor of the State, requiring the defendants to account for and pay over the interest received by them. An appeal was then taken to the State Supreme Court.

Political.—On April 7 a State election was held for a Justice of the Supreme Court to succeed Chief-Justice Orsamus Cole, who declined a re-election. Party lines were not drawn. There were two candidates, both Democrats, S. U. Pinney, who was nominated by a convention of lawyers, and E. S. Ellis, who was put forward by Democratic politicians, though not formally nominated. The people elected S. U. Pinney by a vote of 96,564 to 76,691 for E. S. Ellis.

WYOMING, a Northwestern State, admitted to the Union July 10, 1890; area, 97,890 square miles; population in 1890, 60,705. Capital, Cheyenne.

Government.—The following were the State officers during the year: Governor, Amos W. Barber (acting); Secretary of State, Amos W. Barber; Treasurer, Otto Gramm; Auditor, Charles W. Burdick; Attorney-General, Charles N. Potter; Superintendent of Public Instruction, Stephen T. Farwell; Chief Justice of the Supreme Court, Herman V. S. Groesbeck; Associate Justices, A. B. Conaway, Homer Merrill—all Republicans.

State Legislature.—The Senate consists of 12 Republicans and 3 Democrats; the House, of 25 Republicans and 7 Democrats.

Legislative Session.—An important act of the session was the one providing for the supervision and use of the waters of the State. It di-

vides the State into four water divisions: The first to consist of all lands drained by the North and South Platte and Snake (a tributary of Green river) rivers and their tributaries; the second, of lands drained by the tributaries of the Yellowstone and Missouri rivers north of the North Platte and east of the summit of the Big Horn mountains; the third, of lands drained by the Big Horn river and its tributaries; the fourth, of lands drained by the Green, Bear, and Snake rivers and the tributaries thereof, except Snake river, a tributary of Green river, and its tributaries. The Snake river of the fourth division is marked on the maps with a second name, the Shoshone. Each division is to have a superintendent, who shall report to the State Engineer, and the four constitute with him a board of control. Measurements and calculations are first to be made by the engineer for the discharge of streams, beginning with those most used for irrigation or other beneficial purposes. Facts are to be collected and surveys made to determine the most suitable locations for constructing works for utilizing the water of the State and to ascertain the location of the lands best suited for irrigation. The division superintendents are to make reports regarding the amount of water necessary to supply all the ditches, canals, and reservoirs of the districts, the amount actually coming into the district, whether it is on the increase or on the decrease, and what ditches, canals, and reservoirs are without their proper supply. If it shall appear that water is received by any one of these in any division of his district whose claim post-dates that of the ditch, canal, or reservoir in another district as ascertained from his register, he shall at once order the post-dated one shut down and the water given to the elder, his orders being at all times directed to the enforcement of priority of appropriation.

Other sections of the act provide for the determination of priorities of right, prescribe the method of adjudication in disputed cases, the method of action in cases of application from persons, associations, or corporations desiring to construct new distributing works or enlarge old ones; and the legal standard for the measurement of water, both for the purpose of determining the flow in natural streams and for distributing water therefrom, is made a cubic foot of water per second of time.

Some question having arisen as to the legality of the election of Sept. 11, 1890, as regards the county and precinct officers and their terms of office, the Legislature passed an act declaring that since the election was called by the Governor and the several boards of county commissioners, and the electors voted in good faith, it should be recognized as legal, and the terms of office of the county and precinct officers were prescribed.

The Columbian Exposition.—The Legislature, by an act approved Jan. 10, 1891, created a board of commissioners for the exposition, to consist of five members, one of whom should be the State Engineer. They were to hold office till Jan. 1, 1894, and to give bonds in \$5,000 each. An appropriation of \$30,000 was made for the expenses of the State exhibit, and it was provided that not more than \$10,000 should be drawn in each of the years 1891, 1892, and 1893

out of any funds in the State treasury for this purpose. The commission was authorized, if it should be deemed advisable, to erect a State building at a cost not to exceed \$10,000, or, if it should seem for the best interests of the State, to unite with some neighboring State in the erection of a building to be used jointly. And at the close of the exposition the commission is to have power to sell the building, or the interest of the State in the joint building, and return the money to the State treasury. The compensation of the commissioners was fixed at \$5 a day for time actually employed, and expenses necessarily incurred, provided that no public official should receive compensation further than his regular salary and his expenses.

The commission decided upon a separate building for the State, and had plans drawn for one to be built in 1892. These plans were the first to be approved by the exposition authorities. The exterior will be an imitation of stone. The interior will have a main hall 24 by 40 feet, with two offices on the first floor, and sitting and toilet rooms above. The furnishing of the building and the money required to arrange the collective display are expected to be provided by popular subscription. The exhibit of mining products and the like will include a great variety of specimens—gold, silver, copper, tin, iron, aluminum, sulphur, borax, soda, asbestos, graphite, kaolin, grinding, polishing, and lithograph stone, coal, coke, illuminating and lubricating oils, and natural gas. The commission expect to put on exhibition also specimens of tools for both placer and underground mining, machinery for mining and handling coal, and dumping, drawing, and ventilating apparatus, together with maps, models, and pictures to illustrate the mineral and geological deposits of the State. The Committee on Agriculture design to have, in addition to the specimens of their department, diagrams and plans of irrigation works and maps of irrigation districts. They also offer prizes for superior grains, grasses, and garden vegetables.

Irrigation.—A census bulletin issued in August gives the following figures concerning irrigation in Wyoming: There are 1,917 farms that are irrigated, out of a total number of 3,247. The total acres of land to these 4,917 farms is 1,508,850, upon which crops were raised by irrigation in the year 1890. In addition to the irrigation area from which crops were cut or gathered, there were approximately 240,000 acres irrigated for grazing purposes. The average of first cost of water right is \$6.62 an acre; and the average cost of preparing the soil for cultivation, including the purchase price of the land, is \$9.48 an acre. The average present value of the irrigated land of the State, including buildings, etc., is reported as \$31.20 an acre, showing an apparent profit, less cost of buildings, of \$13.50 an acre. The average annual cost of water is 44 cents an acre, which, deducted from the value of products, leaves an average annual return of \$7.81 an acre.

Indian Lands.—In October, the commission appointed by the Secretary of the Interior to negotiate with the Shoshone and Arapahoe Indians of Wyoming for a cession of a part of the Wind River reservation effected an agreement with the Indians, under which they cede to the

United States more than half their reservation, the Government getting about 1,100,000 acres, out of a total of about 2,000,000 acres. For the lands ceded the Indians receive \$600,000, or about 55 cents an acre. Of this amount, all but

a cash payment of \$50,000 will be put into funds for the benefit of the Indians, and the annual interest expended in the purchase and maintenance of an Indian cattle herd, in giving them irrigation ditches, schools, and other things.

X

XYLOPHONE, a musical instrument composed of strips of wood, whose sounds are determined by wooden hammers in the hands of the performer. The name by which it is known in Europe and America is derived from two Greek words meaning "wood" and "to sound." It is called *Strohfiedel* or "straw fiddle" and *Holzharmonica* in Germany, and *staccato* in Italy. It is of ancient origin, and is used in various modifications in many countries. In the usual modern instrument the strips of wood are of graduated lengths and thickness, according to the tone desired to be produced from each, arranged in regular succession from left to right, with their wider surfaces uppermost. They are made of ebony or other seasoned or hard woods, and are held in place by two parallel lines of interlaced or knotted cord, while they rest upon slender strips of bound straw laid horizontally for their support, or they are suspended within a box or frame for deeper resonance. If they are pierced and strung upon the cords it is done at a slight angle. The largest slip gives the lowest note, and is usually not the first note of the scale, but the fifth below, and the highest is three or more notes above the octave. The compass of the instrument can thus be varied to any extent. The mallets are small sticks tipped with balls. The xylophone was derived from the East, and is of great antiquity. It was known in China, in Siam, and to the Hebrews and the natives of Barbary, being still found in primitive use at Freretown, Mombase, on the eastern coast of Africa, composed of five large separate pieces of wood, each thinner at one end, and laid upon two strips of fresh banana wood resting on the ground, and their tones are produced by strik-

ing upon them with hollow short sticks. The natives call it the *marimba*, and it is known by this name also in Guatemala, Central America, where it is frequently seven feet long, with forty strips of hornego wood fastened with cords tightly stretched, with hollow tubes of varying length underneath them to produce more fullness of tone. The Guatemalan native player varies his instrument at will by inserting pieces of beeswax under the end of any piece of wood that may be defective in mellowness of tone. The *ravat-harmonicon* of Siam is the xylophone of that country, and in Japan it is the *mok-kine* instrument. The wooden strips are held with cords in the same manner as in the modern instrument, but are hung upon wooden frames shaped of planks, like an old-fashioned cradle for an infant. The xylophone is an evolution from the castanets of Asia Minor, the transition from which is natural and easy. The *Chinese king* was an upright frame with horizontal bars, from which the clappers were suspended by looped cord, and were struck with small mallets. The instrument used by the natives of Samoa is merely a movable wooden slat fastened to a board, on which they beat time with two sticks. The *gambang ganza harmonica* of Java has hollow cups of wood, or gourds, under the strips, to give depth of tone. It has two minor thirds not contained in the diatonic scale—from third to fifth, and sixth to octave. This scale is known in Asia as the pentatonic scale. The latest adaptation of the xylophone, called the metallophone, has thin strips of metal on frames of wood. The xylophone has been used by Lum-bave's orchestra, and Saint-Saens has introduced with it peculiar effects in his "Danse Macabre."

Y

YOUNG MEN'S CHRISTIAN ASSOCIATION. World's Conference.—The twelfth World's Conference of Young Men's Christian Associations met in Amsterdam, Holland, Aug. 18. Lord Kinnaird, of London, presided at the opening session, and spoke of the growth of the work of the associations on both sides of the Atlantic. Addresses were made by Mr. Paton, of London, and other speakers, on the training and development of voluntary workers. The question, "How may the Secretary get Young Men to enter the Work?" was discussed by Mr. Robert R. McBurney, of New York. Mr. Wishard, Secretary of the College Association, gave the results of his observations during a tour of three years and a half in the East with reference to the work of the associations, speaking particularly of the work in Japan, and of the needs of

India, China, and all Asia. Mr. Hyde Smith, of Australia, also spoke on this branch of the subject. Other special topics discussed during the sessions were: "The Bible in the Associations"; "The Work and Place of Secretaries"; "The Young Men's Christian Association in Roman Catholic Countries, and how to counteract the Difficulties which prevent their Development"; "The Attitude of the Association with regard to Socialism"; and "Spiritual Life in our Association; the Dangers that threaten it in our Actual Development; the Best Means of maintaining and increasing it, and for constantly recruiting Active and truly Converted Members." The members of the conference made an excursion to Nymegen on the Waal, and visited there the ancient heathen temple which Charlemagne converted into a place of Christian worship.
